3Com Corporation reserves the right to revise this documentation and to make changes in content from time to time without obligation on the part of 3Com Corporation to provide notification of such revision or change.

3Com Corporation provides this documentation without warranty, term, or condition of any kind, either implied or expressed, including, but not limited to, the implied warranties, terms or conditions of merchantability, satisfactory quality, and fitness for a particular purpose. 3Com may make improvements or changes in the product(s) and/or the program(s) described in this documentation at any time.

If there is any software on removable media described in this documentation, it is furnished under a license agreement included with the product as a separate document, in the hard copy documentation, or on the removable media in a directory file named LICENSE.TXT or !LICENSE.TXT. If you are unable to locate a copy, please contact 3Com and a copy will be provided to you.

UNITED STATES GOVERNMENT LEGEND

If you are a United States government agency, then this documentation and the software described herein are provided to you subject to the following:

All technical data and computer software are commercial in nature and developed solely at private expense. Software is delivered as "Commercial Computer Software" as defined in DFARS 252.227-7014 (June 1995) or as a "commercial item" as defined in FAR 2.101(a) and as such is provided with only such rights as are provided in 3Com's standard commercial license for the Software. Technical data is provided with limited rights only as provided in DFAR 252.227-7015 (Nov 1995) or FAR 52.227-14 (June 1987), whichever is applicable. You agree not to remove or deface any portion of any legend provided on any licensed program or documentation contained in, or delivered to you in conjunction with, this User Guide.

Unless otherwise indicated, 3Com registered trademarks are registered in the United States and may or may not be registered in other countries.

3Com and the 3Com logo are registered trademarks of 3Com Corporation.

H3C, , Aolynk, , H3Care, , TOP G, , IRF, NetPilot, Neocean, NeoVTL, SecPro, SecPoint, SecEngine, SecPath, Comware, Secware, Storware, NQA, VVG, V2G, VnG, PSPT, XGbus, N-Bus, TiGem, InnoVision and HUASAN are trademarks of Hangzhou H3C Technologies Co., Ltd., a 3Com company.

All other trademarks that may be mentioned in this manual are the property of their respective owners.

ENVIRONMENTAL STATEMENT

It is the policy of 3Com Corporation to be environmentally-friendly in all operations. To uphold our policy, we are committed to:

Establishing environmental performance standards that comply with national legislation and regulations.

Conserving energy, materials and natural resources in all operations.

Reducing the waste generated by all operations. Ensuring that all waste conforms to recognized environmental standards. Maximizing the recyclable and reusable content of all products.

Ensuring that all products can be recycled, reused and disposed of safely.

Ensuring that all products are labelled according to recognized environmental standards.

Improving our environmental record on a continual basis.

End of Life Statement

3Com processes allow for the recovery, reclamation and safe disposal of all end-of-life electronic components.

Regulated Materials Statement

3Com products do not contain any hazardous or ozone-depleting material.

Environmental Statement about the Documentation

The documentation for this product is printed on paper that comes from sustainable, managed forests; it is fully biodegradable and recyclable, and is completely chlorine-free. The varnish is environmentally-friendly, and the inks are vegetable-based with a low heavy-metal content.

About This Guide

This manual covers the command line interface (CLI) of the H3C MSR 20/30/50 Series routers. It provides a detailed description of the operating commands, which are organized by feature. An alphabetical listing of all commands can be found beginning on page 75.

This manual is intended for the following readers:

- Network administrators
- network engineers
- Users who are familiar with the basics of networking

Always download the Release Notes for your product from the 3Com World Wide Web site and check for the latest updates to software and product documentation: ***http://www.3Com.com***

Conventions

Table 1 lists icon conventions that are used throughout this guide.

Table 1 Notice Icons

Icon	Notice Type	Description
	Information note	Information that describes important features or instructions.
	Caution	Information that alerts you to potential loss of data or potential damage to an application, system, or device.
	Warning	Information that alerts you to potential personal injury.

Table 2 lists text conventions that are used throughout this guide.

Table 2 Text Conventions

Convention	Description
`Screen displays`	This typeface represents information as it appears on the screen.
Keyboard key names	If you must press two or more keys simultaneously, the key names are linked with a plus sign (+), for example: Press Ctrl+Alt+Del
The words "enter" and "type"	When you see the word "enter" in this guide, you must type something, and then press Return or Enter. Do not press Return or Enter when an instruction simply says "type."

Table 2 Text Conventions

Convention	Description
Words in *italics*	Italics are used to: Emphasize a point. Denote a new term at the place where it is defined in the text. Identify menu names, menu commands, and software button names. Examples: From the *Help* menu, select *Contents*. Click *OK*.
Words in **`bold`**	Boldface type is used to highlight command names. For example, "Use the **`display user-interface`** command to..."

Related Documentation

The following manuals offer additional information necessary for managing your MSR 20/30/50 Series router:

- *H3C MSR 20/30/50 Series Routers Installation Manuals* — Covers setting up and initializing your router.
- *H3C MSR 20/30/50 Series Routers Configuration Guide* — Describes how to operate the router. It includes sections about getting started, system management, interface, link layer protocol, network protocol, routing protocol, multicast protocol, security, VPN, reliability, QoS, dial-up and VoIP, as well as acronyms used in the manual.
- *H3C MSR 20/30/50 Series Routers Interface Card and Interface Module Manual* — Covers the pinouts, function, interface attributes, panels, and LEDs of all interface cards and modules available with the router.
- *LMR Series Routers Cable Manual* — Describes the pinouts of the cables available for LMR series routers.
- *Release Notes* — Contains the latest information about your product. If information in this guide differs from information in the release notes, use the information in the Release Notes.

These documents are available in Adobe Acrobat Reader Portable Document Format (PDF) on the CD-ROM that accompanies your router or on the 3Com World Wide Web site: http://www.3Com.com

Alphabetical Listing of Commands

1 PUBLIC ATM AND DSL INTERFACE COMMANDS

display interface atm

Syntax **display interface atm** [*interface-number*]

View Any view

Parameter *interface-number:* Interface number. If no interface is specified, the configuration and status information about all ATM/DSL interfaces and channels on them is displayed.

Description Use the **display interface atm** command to display the configuration and status information about an ATM interface or a DSL interface.

If no interface is specified, this command displays the configuration and status information about all ATM interfaces and DSL interfaces.

Example # Display the configuration and state information about interface ATM 2/0.

```
<Sysname> display interface atm 2/0
Atm2/0 current state :DOWN
Line protocol current state :DOWN
Description :  Atm2/0 Interface
The Maximum Transmit Unit is 1500
Internet protocol processing : disabled
AAL enabled: AAL5, Maximum VCs: 128
Current VCs: 0 (0 on main interface)
ATM over E1, Scramble enabled, frame-format crc4-adm
code hdb3, clock slave,Cable-length long, loopback not set
Cable type:  75 ohm non-balanced
Line Alarm: LOS LOF
Line Error: 0 FERR, 0 LCV, 0 CERR, 0 FEBE
 Last 0 seconds input  rate 0.00 bytes/sec, 0.00 packets/sec
 Last 0 seconds output rate 0.00 bytes/sec, 0.00 packets/sec
 Input : 0 packets, 0 bytes, 0 buffers
         0 errors, 0 crcs, 0 lens, 0 giants,
         0 pads, 0 aborts, 0 timeouts
         0 overflows, 0 overruns,0 no buffer
 Output: 0 packets, 0 bytes, 0 buffers
         0 errors, 0 overflows, 0 underruns
```

interface atm

Syntax **interface atm** *interface-number*

View System view

Parameter *interface-number*: ATM or DSL interface number or DSL interface view.

Description Use the **interface atm** command to enter ATM interface view.

Example # Enter ATM 2/0 interface view.

```
<Sysname> system-view
[Sysname] interface atm 2/0
[Sysname-Atm2/0]
```

reset atm interface

Syntax **reset atm interface** [**atm** *interface-number*]

View User view

Parameter **atm** *interface-number*: Specifies an ATM interface.

Description Use the **reset atm interface** command to clear the statistics on the PVCs created on an ATM interface or all the ATM interfaces.

Note that:

- If you execute this command with an ATM interface specified, this command displays the statistics on the PVCs created on the ATM interface.
- If you execute this command with no ATM interface specified, the statistics on the PVCs created on all the ATM interfaces are cleared.

To clear statistics about ATM interfaces, use the **reset counters interface** command, which is described in *Ethernet Interface Commands* in the *Access Volume*.

Example # Clear the statistics on all the PVCs created on ATM 2/0 interface.

```
<Sysname> reset atm interface atm 2/0
```

2 IMA-E1/T1 Interface Configuration Commands

cable

Syntax **cable** { **long** | **short** }

undo cable

View ATM E1/T1 interface view

Parameter **long**: Long haul mode, with a cable length in the range 151 to 500 m (495 to 1640 ft.).

short: Short haul mode, with a cable length in the range 0 to 150 m (0 to 495 ft.).

Description Use the **cable** command to set the cable length of the ATM E1 interface.

Use the **undo cable** command to restore the default.

By default, long haul mode applies, allowing of cable length mode adaptation. In this case, the long haul mode is adopted first. If the cable is of short haul mode, the system switches to the short haul mode automatically.

To have the system use the short haul mode, use the **cable short** command.

Related command: **frame-format**.

Example # Set the cable length of ATM E1 interface 5/0 to long haul.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] cable long
```

clock

Syntax **clock** { **master** | **slave** }

undo clock

View ATM E1/T1 interface view

Parameter **master**: Sets the clock mode as master.

slave: Sets the clock mode as slave.

Description Use the **clock** command to set the clock mode for an ATM E1/T1 interface.

Use the **undo clock** command to restore the default, that is, the slave clock mode.

For ATM E1/T1 interfaces operating as DCEs, set the clock mode to master. For interfaces operating as DTEa, set the clock mode to slave.

When the ATM interfaces on two routers are connected directly through a fiber-optic cable, set the clock mode to master at one end and to slave at the other end.

Example # Set the clock mode of ATM E1/T1 interface 5/0 to master.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] clock master
```

code

Syntax In ATM E1 interface view:

code { **ami** | **hdb3** }

In ATM T1 interface view:

code { **ami | b8zs** }

undo code

View ATM E1/T1 interface view

Parameter **ami**: Sets the ATM E1/T1 line coding format as AMI.

hdb3: Sets the ATM E1/T1 line coding format as HDB3.

b8zs: Sets the ATM E1/T1 line coding format as B8ZS.

Description Use the **code** command to set the line coding format for an ATM E1/T1 interface.

Use the **undo code** command to restore the default line coding format.

By default, the line coding format of an ATM E1 interface is HDB3, and that of an ATM T1 interface is B8ZS.

Use the **code** command to set the line coding format for an ATM E1/T1 interface.

Use the **undo code** command to restore the default line coding format.

By default, the line coding format of an ATM E1 interface is HDB3, and that of an ATM T1 interface is B8ZS.

Example # Set the line coding format to AMI for ATM 5/0 interface.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] code ami
```

differential-delay

Syntax **differential-delay** *milliseconds*

undo differential-delay

View IMA group interface view

Parameter *milliseconds*: Maximum differential delay, in the range 25 to 100 milliseconds.

Description Use the **differential-delay** command to set the maximum differential delay for the member links in the IMA group.

Use the **undo differential-delay** command to restore the default, that is, 25 milliseconds.

Example # Set the maximum differential delay for the member links in IMA group 1 to 25 milliseconds.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] ima ima-group 1
[Sysname-Atm5/0] interface ima-group 5/1
[Sysname-Ima-group5/1] differential-delay 25
```

display interface ima-group

Syntax **display interface ima-group** [*group-interfacenumber*]

View Any view

Parameter *group-interfacenumber*: IMA group interface number.

Description Use the **display interface ima-group** command to display the configuration and status information about an IMA group interface or all the IMA group interfaces.

If you specify the *group-interfacenumber* argument, this command displays the configuration and status information about the IMA group interface identified by the argument. Otherwise, this command displays the configuration and status information about all the IMA group interfaces.

Example # Display the status and configuration information about IMA group interface 3.

```
<Sysname> display interface ima-group 5/3
Ima-group5/3 current state :DOWN
Line protocol current state :DOWN
Description :  Ima-group3 Interface
Total available baudrate is 1544000 bps,the baudrate now is 1544000 bps
The Maximum Transmit Unit is 1500
Internet protocol processing : disabled
AAL enabled: AAL5, Maximum VCs: 128
Current VCs: 0 (0 on main interface)
Physical layer is ATM over IMA
IMA-clock: CTC, active-links-minimum: 1
Frame-length: 128, differential-delay-maximum: 25
symmetry: symmetrical configuration and operation

 Ima-group state:
    ImaGroupNeState          START_UP      ImaGroupFeState          START_UP
    ImaGroupNeFailureStatus  START_UP      ImaGroupFeFailureStatus  START_UP
 Ima-Link state:
    IMA Link Number :  1 , First Link: 0
 Test Status: Disabled

 Last 300 seconds input  rate 0.00 bytes/sec, 0.00 packets/sec
 Last 300 seconds output rate 0.00 bytes/sec, 0.00 packets/sec
 Input : 0 packets, 0 bytes, 0 buffers
         0 errors, 0 crcs, 0 lens, 0 giants,
         0 pads, 0 aborts, 0 timeouts
         0 overflows, 0 overruns,0 no buffer
 Output: 0 packets, 0 bytes, 0 buffers
         0 errors, 0 overflows, 0 underruns
```

frame-format

Syntax In ATM E1 interface view:

frame-format { **crc4-adm** | **no-crc4-adm** }

In ATM T1 interface view:

frame-format { **esf-adm** | **sf-adm** }

undo frame-format

View ATM E1/T1 interface view

Parameter **crc4-adm**: Sets the ATM over E1 framing format to 4-bit cyclic redundancy check ATM direct mapping (CRC4 ADM).

no-crc4-adm: Sets the ATM over E1 framing format to no-CRC4 ADM.

esf-adm: Sets the ATM over T1 framing format to extended super frame ADM (ESF ADM).

sf-adm: Sets the ATM over T1 framing format to super frame ADM (SF ADM).

Description Use the **frame-format** command to configure the ATM over E1/T1 framing format.

Use the **undo frame-format** command to restore the default, that is, CRC4 ADM for ATM E1 interfaces and ESF ADM for ATM T1 interfaces.

ATM Direct Mapping (ADM) directly maps ATM cells transmitted over the E1/T1 line into E1/T1 frames. This process is defined by ITU-T G.804 and ATM forum.

Example # Configure no-CRC4 ADM framing on ATM E1 interface 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] frame-format no-crc4-adm
```

frame-length

Syntax **frame-length** { **32** | **64** | **128** | **256** }

undo frame-length

View IMA group interface view

Parameter **32**, **64**, **128**, **256**: Specifies the number of ATM cells in an IMA frame.

Description Use the **frame-length** command to configure the number of ATM cells in an IMA frame.

Use the **undo frame-length** command to restore the default, that is, 128 ATM cells in an IMA frame.

Example # Set the number of ATM cells in an IMA frame to 64 on IMA group interface 1.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] ima ima-group 1
[Sysname-Atm5/0] interface ima-group 5/1
[Sysname-Ima-group5/1] frame-length 64
```

ima ima-group

Syntax **ima ima-group** *group-number*

undo ima ima-group

View ATM E1/T1 interface view

Parameter *group-number*: IMA group number, in the range 1 to 8.

Description Use the **ima ima-group** command to add an ATM E1/T1 interface to an IMA group. If the specified IMA group does not exist, it is created first.

Use the **undo ima ima-group** command to remove an interface from an IMA group.

By default, no IMA group is created.

Before adding an ATM E1/T1 interface to an IMA group, you need to remove the network layer service-related configurations of the interface. for example, the IP address assigned to the interface by using the **undo ip address** command.

The first link in the IMA group is the primary link. You can remove it only when you remove the IMA group.

Example # Add the link of ATM E1 interface 5/0 to IMA group 1.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] ima ima-group 1
```

ima-clock

Syntax **ima-clock** { **ctc** [**link-number** *number*] | **itc** }

undo ima-clock

View IMA group interface view

Parameter **ctc**: Common transmit clock configuration. In this mode, all links in the IMA group share the same clock source, which can be an external clock or the one extracted from a member link.

link-number *number*: Number of the E1/T1 link that provides the clock source. It ranges from 0 to 7.

itc: Independent transmit clock configuration. In this mode, the links in the IMA group use at least two clock sources.

Description Use the **ima-clock** command to configure the clock mode of the IMA group.

Use the **undo ima-clock** command to restore the default, that is, CTC.

When the IMA group adopts ITC mode, you must set the clock mode of each member ATM E1/T1 link to slave with the **clock slave** command.

When the IMA group adopts CTC mode, you must set the clock mode of each member ATM E1/T1 link to master with the **clock master** command.

Example # Set the clock mode to ITC on IMA group 1.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] ima ima-group 1
[Sysname-Atm5/0] interface ima-group 5/1
[Sysname-Ima-group5/1] ima-clock itc
```

ima-standard

Syntax **ima-standard { alternate-v10 | normal | standard-v10 | standard-v11 }**

undo ima-standard

View IMA group interface view

Parameter **alternate-v10**: Uses V1.0 (other implementation) standard.

normal: Uses V1.1 standard. An IMA group interface adopting this standard changes to adopt V1.0 (standard implementation) standard if its peer interface adopts V1.0 (standard implementation).

standard-v10: Uses V1.0 (standard implementation) standard.

standard-v11: Uses V1.1 standard.

Description Use the **ima-standard** command to set the standard to be adopted by an IMA group interface.

Use the **undo ima-standard** command to restore the default.

By default, V1.1 standard is adopted.

Example # Configure to adopt V1.1 standard.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] ima ima-group 1
[Sysname-Atm5/0] interface ima-group 5/1
[Sysname-Ima-group5/1] ima-standard standard-v11
```

ima-test

Syntax **ima-test** [**link-number** *number*] [**pattern-id** *id*]

undo ima-test

View IMA group interface view

Parameter **link-number** *number*: Specifies the number of the E1/T1 link to be tested.

pattern-id *id*: Specifies the test mode, a hexadecimal number in the range 0x00 to 0xFE.

Description Use the **ima-test** command to specify the E1/T1 link to be tested and the test mode for IMA group interface test.

Use the **undo ima-test** command to cancel the test.

By default, IMA group interface test is disabled.

Note that:

- If you do not specify the *number* argument, the **ima-test** command specifies to test the link that is the first to be added to the IMA group interface.
- If you do not specify the *id* argument when executing the **ima-test** command, the default test mode (that is, 0xAA) is adopted.
- You can use this command to test the connectivity of a link to the rest of the IMA group by sending a test pattern over the link. This test mode is looped over all the active links at the far end and back to the transmitter. To display the connectivity test result, perform the **display interface ima-group** command.

E1/T1 links are bidirectional. This command tests only the connectivity of a link in its transmit direction to the other links in the IMA group in their receive direction.

Example # Send test mode 0xAB over link 0 in IMA group interface 1.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] ima ima-group 1
[Sysname-Atm5/0] interface ima-group 5/1
[Sysname-Ima-group5/1] ima-test link-number 0 pattern-id ab
```

interface ima-group

Syntax **interface ima-group** *group-interfacenumber*

View System view

Parameter *group-interfacenumber*: IMA group interface number.

Description Use the **interface ima-group** command to enter IMA group interface view.

Example # Enter IMA group interface 1 view.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] ima ima-group 1
[Sysname-Atm5/0] quit
[Sysname] interface ima-group 5/1
[Sysname-Ima-group5/1]
```

loopback

Syntax **loopback** { **cell** | **local** | **payload** | **remote** }

undo loopback

View ATM E1/T1 interface view

Parameter **cell**: Internal cell loopback for checking that the local physical chip is operating.

local: Internal loopback for checking that the local service chip is operating.

payload: External payload loopback for checking that payload framing is normal.

remote: External loopback for checking that the remote end is normal.

Description Use the **loopback** command to configure the loopback mode on the ATM E1/T1 interface.

Use the **undo loopback** command to disable loopback.

By default, loopback is disabled.

Example # Enable external payload loopback on ATM E1/T1 interface 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] loopback payload
```

min-active-links

Syntax **min-active-links** *number*

undo min-active-links

View IMA group interface view

Parameter *number*: Number of links, in the range 1 to 8.

Description Use the **min-active-links** command to configure the minimum number of links required for the IMA group to work.

Use the **undo min-active-links** command to restore the default, that is, 1.

Example # Set the minimum number of links required for IMA group 1 to operate to 2.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] ima ima-group 1
[Sysname-Atm5/0] interface ima-group 5/1
[Sysname-Ima-group5/1] min-active-links 2
```

scramble

Syntax **scramble**

undo scramble

View ATM E1/T1 interface view

Parameter None

Description Use the **scramble** command to enable payload scrambling on the ATM E1/T1 interface. This, however, does not affect cell headers.

Use the **undo scramble** command to disable payload scrambling.

By default, payload scrambling is enabled on an ATM E1/T1 interface.

Example # Enable payload scrambling on ATM interface 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] scramble
```

3 ATM E3/T3 Interface Configuration Commands

cable

Syntax **cable** { **long** | **short** }

undo cable

View ATM T3 interface view

Parameter **long**: Long haul mode, with a cable length in the range 151 to 500 m (495 to 1640 ft.).

short: Short haul mode, with a cable length in the range 0 to 150 m (0 to 495 ft.).

Description Use the **cable** command to configure the cable length of the ATM T3 interface.

Use the **undo cable** command to restore the default.

By default, short haul mode applies.

Example # Set the cable length of ATM T3 interface 5/0 to long haul.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] cable long
```

clock

Syntax **clock** { **master** | **slave** }

undo clock

View ATM E3/T3 interface view.

Parameter **master**: Sets the clock mode as master.

slave: Sets the clock mode as slave.

Description Use the **clock** command to set the clock mode of the ATM E3/T3 interface.

Use the **undo clock** command to restore the default, that is, the slave clock mode.

Example # Set the clock mode of ATM E3/T3 interface 5/0 to master.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] clock master
```

frame-format

Syntax In ATM E3 interface view:

frame-format { **g751-adm** | **g751-plcp** | **g832-adm** }

In ATM T3 interface view:

frame-format { **cbit-adm** | **cbit-plcp** | **m23-adm** | **m23-plcp** }

undo frame-format

View ATM E3/T3 interface view

Parameter **g751-adm**: Sets the framing format of ATM E3 to G.751 ATM direct mapping (G.751 ADM).

g751-plcp: Sets the framing format of ATM E3 to G.751 physical layer convergence protocol (G.751 PLCP).

g832-adm: Sets the framing format of ATM E3 to G.832 ADM.

cbit-adm: Sets the framing format of ATM T3 to C-bit ADM.

cbit-plcp: Sets the framing format of ATM T3 to C-bit PLCP.

m23-adm: Sets the framing format of ATM T3 to M23 ADM.

m23-plcp: Sets the framing format of ATM T3 to M23 PLCP.

Description Use the **frame-format** command to configure the framing format of the ATM E3/T3 interface.

Use the **undo frame-format** command to restore the default, that is, G.751 PLCP for ATM E3 interfaces and C-bit PLCP for ATM T3 interfaces.

Example # Set the framing format of ATM E3 interface 5/0 to G.832 ADM.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] frame-format g832-adm
```

loopback

Syntax **loopback { cell | local | payload | remote }**

undo loopback

View ATM E3/T3 interface view

Parameter **cell:** Internal cell loopback, used to check whether the local end physical chipset is working properly

local: Internal loopback, used to check whether the local service chip is working properly.

payload: External payload loopback, used to check whether payload framing is normal.

remote: External line loopback, used to check whether the remote end is working properly.

Description Use the **loopback** command to configure the loopback mode on the ATM E3/T3 interface.

Use the **undo loopback** command to disable loopback.

By default, loopback is disabled.

Example # Enable external payload loopback on ATM E3/T3 interface 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] loopback payload
```

scramble

Syntax **scramble**

undo scramble

View ATM E3/T3 interface view

Parameter None

Description Use the **scramble** command to enable payload scrambling on the ATM E3/T3 interface. This, however, does not affect cell headers.

Use the **undo scramble** command to disable payload scrambling.

By default, payload scrambling is enabled on an ATM E3/T3 interface.

Example # Disable payload scrambling on ATM E3/T3 interface 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] undo scramble
```

4 ATM OC-3c/STM-1 Interface Configuration Commands

clock

Syntax **clock** { **master** | **slave** }

undo clock

View ATM OC-3c interface view, STM-1 interface view

Parameter **master**: Sets the clock mode as master.

slave: Sets the clock mode as slave.

Description Use the **clock** command to set the clock mode for an ATM OC-3c/STM-1 interface.

Use the **undo clock** command to restore the default, that is, the slave clock mode.

When the ATM interface is operating as DCE, set its clock mode to master. When the interface is operating as DTE, set its clock mode to slave.

When the ATM interfaces on two routers are connected directly through a fiber-optic cable, set the clock mode to master at one end and to slave at the other end.

Example # Set the clock mode of ATM interface 5/0 to master.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] clock master
```

frame-format

Syntax **frame-format** { **sdh** | **sonet** }

undo frame-format

View ATM OC-3c interface view, STM-1 interface view

Parameter **sdh**: Sets the framing format to SDH STM-1, the synchronous transport module-level 1 (STM-1) of synchronous digital hierarchy (SDH).

sonet: Sets the framing format to SONET OC-3, the optical carrier level three (OC-3 of synchronous optical network (SONET).

Description Use the **frame-format** command to set the framing format for an ATM OC-3c/STM-1 interface.

Use the **undo frame-format** command to restore the default, that is, SDH STM-1.

Example # Set the framing format to SDH STM-1 on an ATM OC-3c/STM-1 interface.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] frame-format sdh
```

loopback

Syntax **loopback** { **cell** | **local** | **remote** }

undo loopback

View ATM OC-3c interface view, STM-1 interface view

Parameter **cell**: Enables internal cell loopback.

local: Enables internal loopback.

remote: Enables external loopback.

Description Use the **loopback** command to configure the loopback mode on the ATM OC-3c/STM-1 interface.

Use the **undo loopback** command to disable loopback.

By default, loopback is disabled.

Loopback is intended for test use. Disable it otherwise.

Example # Enable internal loopback on ATM interface 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] loopback local
```

scramble

Syntax **scramble**

undo scramble

View ATM OC-3c interface view, STM-1 interface view

Parameter None

Description Use the **scramble** command to enable payload scrambling on the ATM OC-3c/STM-1 interface. This, however, does not affect cell headers.

Use the **undo scramble** command to disable payload scrambling.

By default, payload scrambling is enabled on the ATM OC-3c/STM-1 interface.

Example # Enable payload scrambling on ATM interface 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] scramble
```

5 G.SHDSL Interface Configuration Commands

activate

Syntax **activate**

undo activate

View ATM (G.SHDSL) interface view

Parameter None

Description Use the **activate** command to activate the G.SHDSL interface.

Use the **undo activate** command to deactivate the G.SHDSL interface.

By default, a G.SHDSL interface is active.

A G.SHDSL interface must be activated before it can transmit services. Activation refers to training between the G.SHDSL office end and the STU-C end. During this process, the two parties examine line distance and conditions against the line configuration template (which defines the ADSL criteria, channel mode, uplink and downlink speeds, and noise tolerance) and attempt to reach an agreement. If the training succeeds, a communication connection is set up between the two parties.

Contrary to activation, deactivation tears down the communication connection between the two parties. To transmit services, you need to re-activate the interface.

The commands here are intended for test and diagnosis purposes. Unlike the **shutdown** and **undo shutdown** commands, the commands here only affect a G.SHDSL line.

Since a G.SHDSL interface is always on, it transits to the active state automatically at boot and remains in this state as long as the link is in good condition. The router tests the performance of the line regularly. Once it finds that the line performance is deteriorating, it automatically deactivates, retrains, and then reactivates the line.

Example # Activate Atm 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] activate
```

display dsl configuration

Syntax **display dsl configuration interface atm** *interface-number*

View Any view

Parameter *interface-number*: Specifies a iG.SHDSL interface to view the configuration information about.

Description Use the **display dsl configuration** command to display actual GSHDSL configurations.

Example # Display the actual configurations of G.SHDSL interface ATM 3/0.

```
<Sysname> display dsl configuration interface atm 3/0
 GSHDSL line parameter and mode Configuration

Remote Handshake Status	--

display dsl status

Syntax **display dsl status interface atm** *interface-number*

View Any view

Parameter *interface-number*: Specifies a G.SHDSL interface to view the status information about.

Description Use the **display dsl status** command to display status information about the specified G.SHDSL interface.

Example # Display status information about ATM 5/0, which is a two-wire G.SHDSL interface that is up.

```
<Sysname> display dsl status interface atm 5/0
 Operating Mode: CPE
DSL Mode:  SHDSL Annex B
Configured Wire Type:   2

Table 2 Description on the fields of the display dsl status command

Field	Description
Operating Mode	CPE or CO
DSL Mode	Annex standard used on the interface: Annex A or Annex B
Configured Wire Type	Configured wire mode of the interface: two-wire or four-wire
Line A Statistics since last activation	Statistics about wire-pair A from the time of initiating to present
CRC	Count of CRC errors
LOSW Defect	Count of loss of synchronization word defects
ES	Error second, count of errors per second
SES	Severely error second, count of severe errors per second
UAS	Unavailable second, count of one-second intervals for which the G.SHDSL line is unavailable
TX EOC	Count of transmitted EOC cells
RX EOC	Count of received EOC cells
Line A status	State of wire-pair A
Xcvr Op State: Data Mode	Operating state of the receiver
Last Fail Op State	Operating state of the receiver when the last negotiation failed
Frame Sync	State of frame synchronization
Line Rate(Kbps)	Negotiated wire-pair speed
Wire Type	Wire type: four-wire, or two-wire
SNR Margin(dB)	Margin to SNR
Loop Attenuation(dB)	Loop attenuation
RecvGain(dB)	Receive gain
TxPower(dBm)	Transmit power
Power Backoff	State of power compensation
Power Backoff Level	Level of power compensation
Tip/Ring Reversal	State of Tip/Ring reverse
FrmOH Stat	Frame outflow state
Rmt Encoder A	Encoding coefficient A
Rmt Encoder B	Encoding coefficient B
Rmt NSF Cusdata	Remote NSF user data
Rmt NSF CusID	Remote NSF user ID
Rmt Country Code	Remote country code

Table 2 Description on the fields of the display dsl status command

Field	Description
Rmt Provider Code	Remote code of the chip provider
Rmt Vendor Data	Remote code of the chip vendor

display dsl version

Syntax **display dsl version interface atm** *interface-number*

View Any view

Parameter *interface-number*: Specifies a G.SHDSL interface to view the version and support capability information about it.

Description Use the **display dsl version** command to display the version and support capability information about the specified G.SHDSL interface.

Example # Display the G.SHDSL version of G.SHDSL interface ATM 5/0.

```
<Sysname> display dsl version interface atm 5/0
 Dsl Line Type:          G.SHDSL
 ATM SAR Device:         0x823614f1
 ATM SAR Revision:       0x02
 Chipset Vendor:         GSPN
 Firmware Rel-Rev:       R2.3.1-0
 DSP Version:            1
 PCB Version:            0.0
 CPLD Version:           0.0
 Driver Version:         2.0
 Hardware Version:       1.0
 ITU G991.2 ANNEX A:     Supported
 ITU G991.2 ANNEX B:     Supported
```

Table 3 Description on the fields of the display dsl version interface atm command

Field	Description
Dsl line Type	Type of the user access line
ATM SAR Device	Identifier of the SAR chip
ATM SAR Revision	Revision identifier of the SAR chip
Chipset Vendor	Identifier of the DSL chipset vendor
Firmware Rel-Rev	Identifier and version of the firmware
DSP Version	--
PCB Version	--
CPLD Version	Logic version
Driver Version	Driver software version
Hardware Version	--
ITU G991.2 ANNEX A, ITU G991.2 ANNEX B	Standards and the annexes supported by the interface

shdsl annex

Syntax **shdsl annex** { **a** | **b** }

undo shdsl annex

View ATM (G.SHDSL) interface view

Parameter **a**: Annex A.

b: Annex B.

Description Use the **shdsl annex** command to configure the annex standard supported on the G.SHDSL interface. You cannot activate a link with different standard types at its two ends.

Use the **undo shdsl annex** command to restore the default, that is, Annex B.

Annex A is dominant in North America while Annex B is dominant in Europe. When setting annex standard, you must consider the standard adopted in the region where your network is located. When ATU-C and ATU-R use different standards, G.SHDSL cannot set up connection.

Example # Configure G.SHDSL interface ATM 5/0 to support annex A.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] shdsl annex a
```

shdsl mode

Syntax **shdsl mode** { **co** | **cpe** }

undo shdsl mode

View ATM (G.SHDSL) interface view

Parameter **co**: Specifies the central office (CO) mode.

cpe: Specifies the customer premises equipment (CPE) mode.

Description Use the **shdsl mode** command to set the operating mode for a G.SHDSL interface.

Use the **undo shdsl mode** command to restore the default.

By default, a G.SHDSL interface operates in CPE mode.

For a back-to-back connection, you need to configure one end to CO mode and the other end to CPE mode.

Example # Set the operating mode of interface ATM 5/0 to CO.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] shdsl mode co
```

shdsl psd

Syntax **shdsl psd** { **asymmetry** | **symmetry** }

undo shdsl psd

View ATM (G.SHDSL) interface view

Parameter **asymmetry**: Specifies the asymmetric mode, where different power spectral densities (PSD) are set for the central office (CO) and the customer premises equipment (CPE).

symmetry: Specifies the symmetric mode, where the same PSD is set for the CO and CPE.

Power spectral density (PSD) is the amount of power per unit (density) of frequency (spectral) as a function of the frequency. PSD describes how the power of a time series is distributed with frequency.

Description Use the **shdsl psd** command to set PSD of the G.SHDSL interface working as CPE. It is not necessarily the same as the one set at CO.

Use the **undo shdsl psd** command to restore the default.

By default, the PSD of the G.SHDSL interface is in symmetric mode.

Example # Set the PSD of G.SHDSL interface ATM 5/0 to asymmetric mode.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] shdsl psd asymmetry
```

shdsl rate

Syntax **shdsl rate** { **auto** | *rate* }

undo shdsl rate

View ATM (G.SHDSL) interface view

Parameter **auto**: Auto-negotiation mode

rate: Maximum single-pair rate of the G.SHDSL interface, in the range of 64 to 2,312, in units of kbps.

- *For four-wire (dual-pair) G.SHDSL, the interface rate is two times single-pair rate. For example, if you set single-pair rate to 2,312 kbps, four-wire interface rate is 4,624 kbps.*
- *Because four-wire G.SHDSL interfaces cannot negotiate rate, do not set their single-pair interface rate to **auto** mode.*

Description Use the **shdsl rate** command to set the single-pair interface rate of the SHDSL interface.

Use the **undo shdsl rate** command to restore the default, that is, **auto**.

In actual applications, likelihood exists that the maximum downlink rate could not reach the specified rate as restricted by ATU-C and line conditions. If you select the **auto** mode, CPE and CO can negotiate a rate commensurate with the current line condition during the activating process. If fixed rates are set at the two ends, the two parties negotiate a rate. In case the lower rate between them cannot be provided, the line could not be activated.

By default, the rate of two-wire G.SHDSL interface is set to auto-negotiation mode; the single-pair interface rate of four-wire G.SHDSL interface is set to 2,312 kbps (four-wire G.SHDSL interface rate is 4,624 kbps).

Example # Configure ATM 5/0 to operate in the auto-negotiation mode.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] shdsl rate auto
```

shdsl snr-margin

Syntax **shdsl snr-margin** [**current** *current-margin-value*] [**snext** *snext-margin-value*]

undo shdsl snr-margin

View ATM (G.SHDSL) interface view

Parameter *current-margin-value*: Sets a target margin, in the range 0 to 10. During SHDSL line training, this target margin is considered in addition to the signal-to-noise ratio (SNR) threshold. A larger margin value means increased link stability and noise suppression ability.

snext-margin-value: Sets a target margin, in the range 0 to 10. During SHDSL line training, this target margin is considered in addition to the SNEXT threshold. A larger margin value means increased link stability and noise suppression ability.

Description Use the **shdsl snr-margin** command to set a target margin to signal-to-noise ratio (SNR).

Use the **undo shdsl snr-margin** command to restore the default.

Setting margin can affect maximum rate of the line. When line condition is good, you can set a small margin to obtain higher rate. When much noise is around the line, this may cause disconnection however.

By default, *current-margin-value* is set to 2 and *snext-margin-value* is set to 0.

Example # Set the SNR target margin to 5 on interface ATM 5/0.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] shdsl snr-margin current 5
```

shdsl wire

Syntax **shdsl wire** { **2** | **4-auto-enhanced** | **4-enhanced** | **4-standard** }

undo shdsl wire

View ATM (G. SHDSL) interface view

Parameter **2**: Two-wire mode.

4-auto-enhanced: Four-wire auto-switch mode. When this mode is enabled, the four-wire enhanced mode is used first when the local end negotiates with the remote end. If the remote end is not operating in four-wire enhanced mode, the local end uses the four-wire standard mode for negotiation. When four-wire auto-switch mode is adopted, the remote end can be set to operate in four-wire enhanced mode or four-wire standard mode.

4-enhanced: Four-wire enhanced mode. In this mode, the two pairs of the four wires can start negotiation separately; in addition, the remote end must be set to operate in four-wire enhanced mode as well.

4-standard: Four-wire standard mode. In this mode, the two pairs of these four wires must start negotiation at the same time; in addition, the remote end must be set to operate in four-wire standard mode as well.

Description Use the **shdsl wire** command to set the operating mode of the current G.SHDSL interface.

Use the **undo shdsl wire** command to restore the default.

By default, the four-wire G.SHDSL interface operates in four-wire enhanced mode.

*The **shdsl wire** command is available for four-wire G.SHDSL devices only.*

Example # Set four-wire G.SHDSL interface ATM 5/0 to operate in four-wire auto-switch mode.

```
<Sysname> system-view
[Sysname] interface atm 5/0
[Sysname-Atm5/0] shdsl wire 4-auto-enhanced
```

6 ADSL Interface Configuration Commands

activate

Syntax **activate**

undo activate

View ATM (ADSL) interface view

Parameter None

Description Use the **activate** command to activate an ADSL interface.

Use the **undo activate** command to deactivate an ADSL interface.

By default, an ADSL interface is active.

An ADSL interface must be activated before it can transmit services. Activation refers to training between ADSL office end and ATU-R end. During this process, the two parties examine line distance and conditions against the line configuration template (which defines the ADSL criteria, channel mode, uplink and downlink speeds, and noise tolerance) and attempt to reach an agreement. If the training succeeds, a communication connection is set up between the two parties for service transmission.

Contrary to activation, deactivation tears down the communication connection between the two parties. To transmit services, you need to re-activate the interface.

The commands here are intended for test and diagnosis purposes. Unlike the **shutdown** and **undo shutdown** commands, the commands here only affects a G.SHDSL line.

Since an ADSL interface is always on, it transits to the active state automatically at boot and remains in this state as long as the link is in good condition. The router tests the performance of the line regularly. Once it finds that the line performance is deteriorating, it automatically deactivates, retrains, and then reactivates the line.

Example # Activate ADSL interface 2/0.

```
<Sysname> system-view
[Sysname] interface atm 2/0
[Sysname-Atm2/0] activate
```

adsl standard

Syntax **adsl standard** { **auto** | **g9923** | **g9925** | **gdmt** | **glite** | **t1413** }

undo adsl standard

View ATM (ADSL) interface view

Parameter **auto**: Auto-negotiation mode.

g9923: ADSL2 (G992.3) standard.

g9925: ADSL2+ (G992.5) standard.

gdmt: G.DMT (G992.1) standard.

glite: G.Lite (G992.2) standard.

t1413: T1.413 standard.

Description Use the **adsl standard** command to set the standard applied to an ADSL interface.

Use the **undo adsl standard** command to restore the default, that is, auto-negotiation.

Note that:

- ADSL-I module does not support G.Lite (G992.2) standard and T1.413 standard.
- To bring the standard configured by the **adsl standard** command into effect immediately, you need to re-activate the interface by either the **shutdown** and **undo shutdown** commands or the **activate** and **undo activate** commands.

Example # Apply the standard T1.413 to ATM interface 2/0.

```
<Sysname> system-view
[Sysname] interface atm 2/0
[Sysname-Atm2/0]adsl standard t1413
[Sysname -Atm2/0] shutdown
[Sysname -Atm2/0]undo shutdown
```

adsl tx-attenuation

Syntax **adsl tx-attenuation** *attenuation*

undo adsl tx-attenuation

View ATM (ADSL) interface view

Parameter *attenuation*: Transmit power attenuation, in the range 0 to 12.

Description Use the **adsl tx-attenuation** command to set a transmit power attenuation for the ADSL interface.

Use the **undo adsl tx-attenuation** command to restore the default, that is, 0.

Example # Set the transmit power attenuation to 10 for ATM ADSL interface 2/0.

```
<Sysname> system-view
[Sysname] interface atm 2/0
[Sysname-Atm2/0] adsl tx-attenuation 10
```

bootrom update file

Syntax **bootrom update file** *file-url* **slot** *slot-no-list* [**subslot** *subslot-no-list*] [**all** | **part**]

View User view

Parameter *file-url*: File name (including the path) of the software to be upgraded, a string of 1 to 135 characters.

slot *slot-no-list*: List of slot numbers, representing multiple cards. The argument *slot-no-list* appears in the form of { *slot-no* [to *slot-no*] }&<1-7>, where *slot-no* is the slot number of a card, in the range of 1 to the maximum slot number, and &<1-7> means that you can specify up to 7 slot numbers or slot number ranges for this argument. The maximum slot number differs with device models.

subslot *subslot-no-list*: List of sub-slot numbers, representing multiple sub-cards. The argument *subslot-no-list* appears in the form of { *subslot-no* [to *subslot-no*] }&<1-7>, where *subslot-no* is the sub-slot number of a sub-card, in the range of 1 to the maximum sub-slot number, and &<1-7> means that you can specify up to 7 slot numbers or slot number ranges for this argument. The maximum sub-slot number differs with device models.

part: Upgrades only the extension part of the Boot ROM.

all: Upgrades the entire Boot ROM.

Description Use the **bootrom update file** command to upgrade software on an ADSL2+ card.

By default, the entire BootROM is upgraded.

This feature is only valid for ADSL2+ cards with CPUs.

The upgradeable software includes Boot ROM and ADSL2+ card software. Before you do that, you first need to FTP or load the new software file by other means to the Flash or CF card on your device and save it. Before performing an upgrade, you need to shut down the interface with the **shutdown** command if the interface is up. After completing the upgrade, you need to bring the interface up with the **undo shutdown** command.

Use the **all** keyword with caution. In case failure occurs, recovery is difficult and troublesome.

Note that:

- Only distributed devices support the slot slot-no-list option.
- The **subslot** *subslot-no-list* option is not available if the device does not support the sub-card-level maintenance.

Example # Upgrade software for an ADSL2+ card.

```
<Sysname> system-view
[Sysname]interface atm 2/0
[Sysname-Atm2/0]shutdown
[Sysname-Atm2/0] quit
[Sysname] quit
<Sysname> bootrom update file flash:/bcm6348.bin slot 1 part
This command will update BootRom file on board 2, Continue? [Y/N]y
 Board 2 upgrading BOOTROM, please wait...
<Sysname> system-view
[Sysname]interface atm 2/0
[Sysname-Atm2/0]undo shutdown
```

display dsl configuration

Syntax **display dsl configuration interface atm** *interface-number*

View Any view

Parameter *interface-number*: Specifies a DSL interface to view the configuration information about.

Description Use the **display dsl configuration** command to display the configuration of a DSL interface.

Example # Display the actual configurations of ADSL interface ATM 2/0.

```
<Sysname> display dsl configuration interface atm 2/0

 Line Params Set by User

Table 4 Description on the fields of the display dsl configuration command

Field	Description
Line Params Set by User	Line parameters at ATU-R end, such as Standard, DMT Mode, Framing, and Trellis Coding. Among these parameters, you can only modify Standard for test or diagnosis, but not the others.
The following information appears after the line is activated.	
Actual Config	Real operating parameters after the line is activated
Rate(kbps)	Negotiation rate in kbps, with AS0 (DS) for the downlink and LS0 (US) for the uplink
Latency	Latency mode: Fast or Interleave
DMT Bits Allocation Per Bin	Bits allocated to and carried by each bin.

display dsl status

Syntax **display dsl status interface atm** *interface-number*

View Any view

Parameter *interface-number*: Specifies a DSL interface to view the status information about.

Description Use the **display dsl status** command to display the status information of a specified DSL interface.

Example # Display the status information of the ADSL interface ATM 2/0.

```
<Sysname> display dsl status interface atm 2/0
Line Status:            Loss Of Signal
 Training Status:        Idle

 Active Params           Near End        Far End
 Standard:               G.dmt           G.dmt
 SNR (dB):               0.0             0.0
 Attn(dB):               0.0             0.0
 Pwr(dBm):               0.0             0.0
```

```
 Current Rate(kbps):      0                0
Latency:                 Intl             Intl
```

Table 5 Description on the fields of the display dsl status command

Field	Description
Line Status	Line status of the ADSL interface, which can be: ■ No Defect, indicating the normal state ■ Loss Of Frame, indicating an error concerning frame ■ Loss Of Signal, indicating an error concerning signal ■ Loss Of Power, indicating an error concerning power supply ■ Loss Of Signal Quality, indicating an error concerning signal quality ■ Unknown, indicating an unknown error
Training Status	Training status of the ADSL interface, which can be: ■ Idle, indicating the interface is idle ■ G.994 Training, indicating a G.994 training ■ G.992 Started, indicating a G.992 training is launched ■ G.922 Channel Analysis, indicating G.922 channel analysis is going on ■ G.992 Message Exchange, indicating G.992 message exchange is going on ■ Showtime, indicating normal data exchange ■ Unknown
The following information appears after the line is activated.	
Active Params	■ Standard, connection standard adopted by the interface and the DSLAM ■ SNR, signal-to-noise ration of the ADSL link ■ Attr, attenuation of the ADSL link ■ Pwr, transmit power of the ADSL module, in dbm ■ Current Rate, uplink/downlink rate between the ADSL interface and the DSLAM, in kbps ■ Latency, Way in which the interface and the DSLAM are connected, which can be “Intl” (cross-over) and “Fast”

display dsl version

Syntax **display dsl version interface atm** *interface-number*

View Any view

Parameter *interface-number*: Specifies a DSL interface to view the version and support capability information on it.

Description Use the **display dsl version** command to display the DSL version and support capabilities of an interface.

Example # Display the ADSL version information of interface ATM 2/0.

```
<Sysname> display dsl version interface atm 2/0
Adsl board chipset and version info:
```

```
 Dsl Line Type:          Adsl Over Pots
 Chipset Vendor:         BDCM
 FW Release:             A2pB017l.d15h
 DSP Version:            17.1200
AFE Version:            1.0
 Bootrom Version:        1.1
 Hardware Version:       4.0
 Driver Version:         1.3
 CPLD Version:           1.0

 Adsl Capability
 ANNEX Supported :
  ANNEX A
 Standard Supported :
  ANSI T1.413 Issue 2
  ITU G992.1(G.dmt)
  ITU G992.2(G.lite)
  ITU G992.3(Adsl2)
  ITU G992.3(ReAdsl2)
  ITU G992.5(Adsl2p)
```

Table 6 Description on the fields of the display adsl version command

Field	Description
Adsl board chipset and version info	The components of the interface board and the version
DSL line Type	Type of the user access line
Chipset Vendor	Identifier of the ADSL chipset vendor
FW Release	Identifier and version of the firmware
DSP Version	--
AFE Version	--
PCB Version	--
Driver Version	Version of the driver software
CPLD Version	Version of the logic
Adsl Capability	The standard and annex supported by the interface.

7 POS INTERFACE CONFIGURATION COMMANDS

clock

Syntax **clock { master | slave }**

undo clock

View POS interface view

Parameter **master**: Sets the clock mode of the POS interface to master.

slave: Sets the clock mode of the POS interface to slave.

Description Use the **clock** command to set the clock mode of the POS interface.

Use the **undo clock** command to restore the default, that is, slave.

POS interfaces support two clock modes:

- Master, which uses internal clock signal.
- Slave, which uses line clock signal.

Similar to the DTE/DCE model of synchronous serial interfaces, POS interfaces need to choose a clock mode. When a POS interface on the router is directly connected to another router, the only requirement is that the two sides use different clock modes. In connection to a switch, however, the switch is DCE and uses internal clock, so the POS interface is DTE and must adopt the slave clock mode.

Example # Set the clock mode of interface POS 1/0 to master.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0] clock master
```

crc

Syntax **crc { 16 | 32 }**

undo crc

View POS interface view

Parameter **16**: Sets CRC length to 16 bits.

32: Sets CRC length to 32 bits.

Description Use the **crc** command to set the CRC length on the POS interface.

Use the **undo crc** command to restore the default, that is, 32 bits.

Example # Set the CRC length on interface POS 1/0 to 16 bits.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0] crc 16
```

display interface pos

Syntax **display interface pos** [*interface-number*]

View Any view

Parameter *interface-number*: Interface number.

Description Use the **display interface pos** command to display the status and configuration information of the specified or all POS interfaces.

Example # Display the status and configuration information of the interface POS 1/0.

```
<Sysname> display interface pos 1/0
Pos1/0 current state: UP
Line protocol current state: UP
Description: Pos0/0/0 Interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)
Internet Address is 13.13.13.14/8 Primary
Link layer protocol is PPP
LCP opened, IPCP opened, IP6CP opened
Physical is Pos1/0, baudrate: 155520000
Output queue : (Urgent queuing : Size/Length/Discards)  0/50/0
Output queue : (Protocol queuing : Length)  0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
    Last 5 seconds input:  0 bytes/sec 0 packets/sec
    Last 5 seconds output:  0 bytes/sec 0 packets/sec
    1133 packets input, 14004 bytes, 0 drops
    1133 packets output, 14008 bytes, 0 drops
```

Table 7 Description on the fields of the display interface pos command

Field	Description
Pos1/0 current state	Current state of the POS interface
Line protocol current state	Link layer state of the POS interface
Description	Description on the POS interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)	MTU of the POS interface and the interval at which the link layer protocol sends keepalives

Table 7 Description on the fields of the display interface pos command

Field	Description
Internet protocol processing	IP protocol processing capability, enabled or disabled
Link layer protocol is PPP	Link layer protocol of the POS interface and loopback detection state
LCP opened, IPCP opened, IP6CP opened	LCP state, IPCP state, and IPv6CP state
Physical layer is Pos1/0, Baudrate is 155520000 bps	Physical interface and baudrate
Scramble enabled, crc 32, clock slave, loopback not set	Payload scrambling state, CRC count, clock mode, and loopback state on the interface
Output queue : (Urgent queue : Size/Length/Discards)	Output queues: ■ Urgent queue in size/length/discards ■ Protocol queue in size/length/discards ■ FIFO queue in size/length/discards
Output queue : (Protocol queue : Size/Length/Discards)	
Output queue : (FIFO queuing : Size/Length/Discards)	
SDH alarm section layer line layer path layer C2(Rx), C2(Tx) Rx: J0 Tx: J0 Rx: J1 Tx: J1	SDH alarm counters (or SONET alarm counters depending on framing format) for: ■ Section layer alarms, which could be OOF, LOF, and LOS ■ Line layer alarms, which could be AIS and RDI ■ Path layer alarms, which could be LOP, AIS, and RDI ■ Received and transmitted C2 bytes (C2 is the signal flag byte) ■ Received and transmitted J0 overhead bytes (J0 is the section layer trace byte) Received and transmitted J1 overhead bytes (J1 is the path layer trace byte)
SDH error section layer line layer path layer	SDH error counters (or SONET error counters depending on framing format). They are: B1 for section layer errors B2 for line layer errors and M1 for remote line layer errors B3 for path layer errors and G1 for remote path layer errors
Last 5 seconds input rate 0 bytes/sec, 0 bits/sec, 0 packets/sec	Input rate in Bps, bps, and pps in the last five seconds
Last 5 seconds output rate 0 bytes/sec, 0 bits/sec, 0 packets/sec	Output rate in Bps, bps, and pps in the last five seconds
1133 packets input, 14004 bytes, 0 drops	Count of input and discarded traffic in both packets and bytes
1133 packets output, 14008 bytes, 0 drops	Count of output and discarded traffic in both packets and bytes

display ip interface pos

Syntax **display ip interface pos** *interface-number*

View Any view

Parameter *interface-number:* Interface number.

Description Use the **display ip interface pos** command to view the IP-related configuration and status information of the specified POS interface.

Example # Display IP-related status and configuration information about the interface POS 1/0.

```
<Sysname> display ip interface pos 1/0
Pos1/0 current state :UP
Line protocol current state :UP
Internet Address is 13.13.13.13/8 Primary
Broadcast address : 13.255.255.255
The Maximum Transmit Unit : 1500 bytes
ip fast-forwarding incoming packets state is Enabled
ip fast-forwarding outgoing packets state is Enabled
input packets : 5, bytes : 420, multicasts : 0
output packets : 5, bytes : 420, multicasts : 0
TTL invalid packet number:         0
ICMP packet input number:          5
  Echo reply:                      5
  Unreachable:                     0
  Source quench:                   0
  Routing redirect:                0
  Echo request:                    0
  Router advert:                   0
  Router solicit:                  0
  Time exceed:                     0
  IP header bad:                   0
  Timestamp request:               0
  Timestamp reply:                 0
  Information request:             0
  Information reply:               0
  Netmask request:                 0
  Netmask reply:                   0
  Unknown type:                    0
```

display ipv6 interface pos

Syntax **display ipv6 interface pos** *interface-number*

View Any view

Parameter *interface-number:* Interface number.

Description Use the **display ipv6 interface pos** command to view the IPv6-related configuration and status information of the specified POS interface.

Example # Display IPv6-related status and configuration information about the interface POS1/0.

```
<Sysname> display ipv6 interface pos 1/0
Pos1/0 current state :UP
Line protocol current state :UP
IPv6 is enabled, link-local address is FE80::813D:0:C252:1
  Global unicast address(es):
    22:22::22:22, subnet is 22::/22 [TENTATIVE]
  Joined group address(es):
    FF02::1:FF22:22
    FF02::1:FF52:1
    FF02::2
    FF02::1
  MTU is 4478 bytes
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND retransmit interval is 1000 milliseconds
  Hosts use stateless autoconfig for addresses
```

flag

Syntax **flag** { **c2** | { **j0** | **j1** } { **sdh** | **sonet** } } *flag-value*

undo flag { **c2** | { **j0** | **j1** } { **sdh** | **sonet** } }

View POS interface view

Parameter **c2** *flag-value*: Path signal flag byte, a higher-order path overhead byte used to indicate the multiplex structure of virtual container (VC) frames and property of payload. It is a hexadecimal number in the range 0 to FF.

j0 *flag-value*: Regeneration section trace message, a section overhead byte used to test continuity of the connection between two interfaces at the section level. If the **sdh** keyword is configured, the *flag-value* argument is a string of 1 to 15 hexadecimal digits. If the **sonet** keyword is configured, the argument is a hexadecimal number in the range 0 to FF.

j1 *flag-value*: Path trace message, a higher-order path overhead byte used to test continuity of the connection between two interfaces at the path level. If the **sdh** keyword is configured, the *flag-value* argument is a string of 1 to 15 hexadecimal digits. If the **sonet** keyword is configured, the argument is a string of 1 to 62 characters.

sdh: Sets framing format to SDH.

sonet: Sets framing format to SONET.

CAUTION: *When the length of the string configured for J0 or J1 is less than 15 or 62 characters, the system automatically pad it with hexadecimal 0x0.*

Description Use the **flag** command to set the SONET/SDH overhead bytes.

Use the **undo flag** { **j0** | **j1** } **sdh** command to restore the default SONET/SDH overhead bytes.

By default, the default SDH overhead bytes are used.

The default overhead bytes are as1 follows.

- **c2**: 0x16
- **j0** (SDH): 15 hexadecimal numbers, each of which has the value of 0x0
- **j1** (SDH): 15 hexadecimal numbers, each of which has the value of 0x0
- **j0** (SONET): 0x01
- **j1** (SONET): 62 hexadecimal numbers, each of which has the value of 0x0

Inconsistency between the c2 and j0 settings of a sending POS interface and the receiving POS interface causes alarms.

Related command: **display interface pos**.

Example # Set the SDH overhead byte J0 of POS1/0 interface.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0] flag j0 sdh ff
```

frame-format

Syntax **frame-format** { **sdh** | **sonet** }

undo frame-format

View POS interface view

Parameter **sdh**: Sets framing format to synchronous digital hierarchy (SDH).

sonet: Sets framing format to synchronous optical network (SONET).

Description Use the **frame-format** command to configure framing on the POS interface.

Use the **undo frame-format** command to restore the default, that is, SDH.

Example # Set the framing format on interface POS 1/0 to SDH.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0] frame-format sdh
```

link-protocol

Syntax **link-protocol** { **fr** [**nonstandard** | **ietf** | **mfr** *interface-number* | **nonstandard**] | **hdlc** | **ppp** }

View POS interface view

Parameter **fr**: Specifies Frame Relay as the link layer protocol of the interface.

ietf: Adopts the IETF encapsulation format. This is the default.

mfr *interface-number*: MFR interface or subinterface number. The specified interface must be one that already exists.

nonstandard: Adopts non-standard compatible encapsulation format.

hdlc: Specifies HDLC as the link layer protocol of the interface.

ppp: Specifies PPP as the link layer protocol of the interface.

Description Use the **link-protocol** command to set the link layer protocol of the interface.

By default, PPP is used.

Example # Specify HDLC as the link protocol of interface POS 1/0.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0] link-protocol hdlc
```

loopback

Syntax **loopback** { **local** | **remote** }

undo loopback

View POS interface view

Parameter **local**: Internal loopback.

remote: External loopback.

Description Use the **loopback** command to enable loopback for a POS interface.

Use the **undo loopback** command to disable loopback.

By default, loopback is disabled.

Loopback is intended for test use. Disable it otherwise.

- *If you enable loopback on a POS interface encapsulated with PPP, it is normal that the state of the link layer protocol is reported up.*
- *Loopback and **clock slave** cannot be set at the same time; otherwise, POS interfaces cannot be connected successfully.*

Example # Enable internal loopback on interface POS 1/0.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0] loopback local
```

mtu

Syntax **mtu** *size*

undo mtu

View POS interface view

Parameter *size*: Size (in bytes) of the maximum transmission unit (MTU). MTU range and the default value vary with device.

Description Use the **mtu** command to set the MTU size of the POS interface.

Use the **undo mtu** command to restore the default.

The MTU setting of the POS interface can affect the assembly and fragmentation of IP packets on it.

In QoS, the length of queues is limited. If MTU on the interface is too small, there is likelihood for a large packet to be fragmented into so many fragments that the queue cannot hold them and as such discard them. To avoid this situation, you can extend the queue length by using the **qos fifo queue-length** command in interface view. The default queuing mechanism on the interface is FIFO. For more information on how to configure queuing, refer to "FIFO Queuing Configuration Commands" on page 1809.

Related command: **display interface pos**.

Example # Set MTU of POS interface 0/0/0 to 1492.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0] mtu 1492
```

scramble

Syntax **scramble**

undo scramble

View POS interface view

Parameter None

Description Use the **scramble** command to enable payload scrambling on the POS interface.

Use the **undo scramble** command to disable payload scrambling.

By default, payload scrambling is enabled.

You may configure payload scrambling to prevent the presence of excessive consecutive 1s or 0s to facilitate line clock signal extraction at the receiving end.

Only when POS interfaces on both ends are enabled with payload scrambling can they be connected successfully.

Example # Enable payload scrambling on interface POS 1/0.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0]scramble
```

threshold

Syntax **threshold** { **sd** | **sf** } *value*

undo threshold { **sd** | **sf** }

View POS interface view

Parameter *value*: Integer in the range 3 to 9.

Description Use the **threshold** command to set the SD (signal degrade) threshold or SF (signal fail) threshold for a POS interface.

Use the **undo threshold** command to restore the default.

If you execute the **threshold** command with the *value* argument set to **X**, the value of the threshold specified can be obtained using this expression: 10e-**X**.

By default, SD threshold is 10e-6 (that is, **X** is 6), and SF threshold is 10e-3 (that is, **X** is 3).

SD and SF alarms are used to indicate the current line performance. The bit error rate threshold of SF is higher than that of SD, meaning when small amount of errors occurs, SD alarms are generated; while when error rate is increased to a certain degree, SF alarms are generated, indicating the line performance is degrading seriously.

Note that SD threshold should be smaller than SF threshold.

Currently, this command is not supported.

Example # Set the SD threshold to 10e-4 for POS 1/0.

```
<Sysname> system-view
[Sysname] interface pos 1/0
[Sysname-Pos1/0] threshold sd 4
```

8 GENERAL ETHERNET INTERFACE CONFIGURATION COMMANDS

combo enable

Syntax **combo enable** { **copper** | **fiber** }

View Ethernet interface view (the port should be a Combo Port)

Parameter **copper**: Indicates that the electrical port is enabled and uses double-twisted pair cable.

fiber: Indicates that the optical port is enabled and uses optical fiber cable.

Description Use the **combo enable** command to specify the state of a single Combo port. When one port is enabled, the other will be automatically disabled.

By default, the electrical port is enabled.

Related command: **display port** combo and **shutdown**.

Example # Specify to enable the electrical port of Gigabit Ethernet 1/0 and use double-twisted pair cable.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0
[Sysname-GigabitEthernet1/0] combo enable copper
```

Specify to enable the optical port of Gigabit Ethernet 1/0 and use optical fiber cable.

```
<Sysname> system-view
[Sysname] interface gigabitethernet 1/0
[Sysname-GigabitEthernet1/0] combo enable fiber
```

description

Syntax **description** *text*

undo description

View Ethernet interface view

Parameter *text*: The description of an Ethernet interface, a string of 1 to 80 characters.

Description Use the **description** command to configure the description of an Ethernet interface.

Use the **undo description** command to remove the description.

Default to interface name followed by the "interface" string.

Example # Configure the description for interface Ethernet 1/0 to "lan-interface".

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] description lan-interface
```

display brief interface

Syntax **display brief interface** [*interface-type* [*interface-number*]] [| { **begin** | **include** | **exclude** } *text*]

View Any view

Parameter *interface-type*: Type of a specified interface.

interface-number: Number of a specified interface.

|: Uses a regular expression to filter output information.

begin: Displays all the configuration information in the line that contains the specified string and all the lines after this line.

include: Displays information that contains the specified string.

exclude: Displays information that does not contain the specified string.

text: Regular expression, in the range of 1 to 256 characters, excluding spaces.

Table 8 Special characters used in regular expressions

Character	Meaning	Notes on Use
^	Boundary matcher for the beginning of a line. This character specifies a string with which a line begins.	The regular expression "^user" matches lines that begin with the string "user". Lines that don t begin with the string "user", for example, "Auser", are not matched.
$	Boundary matcher for the end of a line. This character specifies a string with which a line ends.	The regular expression "user$" matches lines that end with the string "user". Lines that do not end with the string, for example, "userA", are not matched.
.	Full stop, used as the wildcard character, which matches any single character, including space.	None

Table 8 Special characters used in regular expressions

Character	Meaning	Notes on Use
*	Star, which matches the occurrences of the character to the left for zero or multiple times	zo* matches z and zoo.
+	Plus, which matches one or multiple occurrences of the character to the left	zo+ matches zo and zoo, but not z.
-	Hyphen, which is used to connect two numbers or characters. Note that the number to the left of this character need to be larger than the one to the right. When used in a "[" and "]" pair, it represents a range.	1-9" represent a range from 1 to 9 ("1" and "9" included), and a-h represent a range from "a" to "h" ("a" and "h" included).
[ ]	Specifies a range.	[1-36A] matches a character, which can be a number in the range 1 to 36 or character A.
( )	Specifies a group of characters. Usually used with "+" and "*".	(123A) specifies the string "123A". 408(12)+ matchers "40812" or "408121212" (but not "408"). That is, "12" can appear for multiple times.

Description Use the **display brief interface** command to display brief interface information, including simple interface name, link state, protocol link state, protocol type, and main IP address.

- If neither interface type nor interface number is specified, all interface information will be displayed;
- If only interface type is specified, then only information of this particular type of interface will be displayed.
- If both interface type and interface number are specified, then only information of the specified interface will be displayed.

Related command: **interface**.

Example # Display brief information of interface(s).

```
<Sysname> display brief interface
The brief information of interface(s) under route mode:
Interface          Link      Protocol-link  Protocol type    Main IP
Eth1/0             UP        DOWN           ETHERNET         --
Eth1/1             UP        DOWN           ETHERNET         --
NULL0              UP        UP(spoofing)   NULL             --
S2/0               DOWN      DOWN           PPP              --
S2/1               DOWN      DOWN           PPP              --

The brief information of interface(s) under bridge mode:
Interface          Link      Speed     Duplex   Link-type  PVID
Eth4/0             DOWN      auto      auto     access     1
Eth4/1             DOWN      auto      auto     access     1
Eth4/2             DOWN      auto      auto     access     1
Eth4/3             DOWN      auto      auto     access     1
Eth4/4             DOWN      auto      auto     access     1
Eth4/5             DOWN      auto      auto     access     1
```

```
Eth4/6              DOWN      auto      auto     access     1
Eth4/7              DOWN      auto      auto     access     1
```

Display brief interface information that contains the string "UP".

```
<Sysname> display brief interface | include UP
The brief information of interface(s) under route mode:
Interface            Link      Protocol-link  Protocol type    Main IP
Eth0/1             UP        DOWN           ETHERNET         --
Eth0/1             UP        DOWN           ETHERNET         --
NULL0                UP        UP(spoofing)   NULL             --
```

Table 9 Description on the fields of the display brief interface command.

Field	Description
The brief information of interface(s) under route mode:	Brief information of interface(s) in route mode
Interface	Interface name
Link	Interface physical link state, which can be up or down
Protocol-link	Interface protocol link state, which can be up or down
Protocol type	Interface protocol type
Main IP	Main IP
The brief information of interface(s) under bridge mode:	Brief information of interface(s) in bridge mode
Speed	Interface rate, in bps
Duplex	Duplex mode, which can be half (half duplex), full (full duplex), or auto (auto-negotiation).
PVID	Default VLAN ID

Table 10 Acronyms for different types of Interface

Interface name	Acronyms
Ethernet	Eth
GigabitEthernet	GE

display interface

Syntax **display interface** [*interface-type* [*interface-number*]]

View Any view

Parameter *interface-type*: Type of a specified interface.

interface-number: Number of a specified interface.

Description Use the **display interface** command to display the current state of a specified interface and related information.

- If neither interface type nor interface number is specified, all interface information will be displayed;

- If only interface type is specified, then only information of this particular type of interface will be displayed.
- If both interface type and interface number are specified, then only information of the specified interface will be displayed.

Related command: **interface**.

Example # Display the current state of Layer 3 interface Ethernet 1/0 and related information.

```
<Sysname> display interface ethernet 1/0
Ethernet 1/0 current state: DOWN
Line protocol current state: DOWN
Description: Ethernet 1/0 Interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)
Internet protocol processing : disabled
IP Packet Frame Type: PKTFMT_ETHNT_2,  Hardware Address: 000f-e223-82f5
IPv6 Packet Frame Type: PKTFMT_ETHNT_2,  Hardware Address: 000f-e223-82f5
Media type is optical fiber, loopback not set, promiscuous mode not set
Speed Negotiation, Duplex Negotiation, link type is autonegotiation
Output flow-control is disabled, input flow-control is disabled
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards)  0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
Last clearing of counters: 17:14:08  Tue 05/09/2006
    Last 300 seconds input rate 0.00 bytes/sec, 0 bits/sec, 0.00 packets/sec
    Last 300 seconds output rate 0.00 bytes/sec, 0 bits/sec, 0.00 packets/sec
    Input: 0 packets, 0 bytes, 0 buffers
           0 broadcasts, 0 multicasts, 0 pauses
           0 errors, 0 runts, 0 giants
           0 crc, 0 align errors, 0 overruns
           0 dribbles, 0 drops, 0 no buffers
    Output:0 packets, 0 bytes, 0 buffers
           0 broadcasts, 0 multicasts, 0 pauses
           0 errors, 0 underruns, 0 collisions
           0 deferred, 0 lost carriers
```

Table 11 Description on the fields of the display interface (in route mode) command.

Field	Description
Ethernet1/0 current state	Interface physical link state
Line protocol current state	Interface protocol link state
Description	The description of an Ethernet interface
The Maximum Transmit Unit	The Maximum Transmit Unit
Hold timer	Hold timer of link state
Internet protocol processing	Internet protocol processing
IP Packet Frame Type, Hardware Address	IP Packet Frame Type, Hardware Address
IPv6 Packet Frame Type, Hardware Address	IPv6 Packet Frame Type, Hardware Address
Output queue (Urgent queue : Size/Length/Discards)	Output queue (current message number in the urgent queue/ maximum number of messages allowed in the urgent queue/number of discarded messages)
Output queue (Protocol queue : Size/Length/Discards)	Output queue (current message number in the protocol queue/ maximum number of messages allowed in the protocol queue/number of discarded messages)

Table 11 Description on the fields of the display interface (in route mode) command.

Field	Description
Output queue (FIFO queuing : Size/Length/Discards)	Output queue (current message number in the FIFO queue/ maximum number of messages allowed in the FIFO queue/number of discarded messages)
Last 300 seconds input rate	Average input rate over the last 300 seconds
Last 300 seconds output rate	Average output rate over the last 300 seconds
Input	Input packets
Output	Output packets

Display the current state of Layer 2 interface Ethernet1/0 and related information.

```
<Sysname> display interface ethernet 1/0
Ethernet1/0 current state: DOWN
 IP Packet Frame Type: PKTFMT_ETHNT_2, Hardware Address: 000f-e200-8048
 Description: Ethernet1/0 Interface
 Loopback is not set
 Media type is twisted pair, port hardware type is 100_BASE_TX
 Unknown-speed mode, unknown-duplex mode
 Link speed type is autonegotiation, link duplex type is autonegotiation
 Flow-control is not enabled
 The Maximum Frame Length is 1536
 Broadcast MAX-ratio: 100%
 Unicast MAX-ratio: 100%
 Multicast MAX-ratio: 100%
 PVID: 100
 Mdi type: auto
 Port link-type: access
  Tagged   VLAN ID : none
  Untagged VLAN ID : 100
 Port priority: 0
 Last 300 seconds input:  6 packets/sec 678 bytes/sec     20%
 Last 300 seconds output:  1 packets/sec 179 bytes/sec     17%
 Input (total):  61745144 packets, 12152212250 bytes
          47519150 broadcasts, 12121681 multicasts
 Input (normal):  61745144 packets, - bytes
          47519150 broadcasts, 12121681 multicasts
 Input:  0 input errors, 0 runts, 0 giants, 0 throttles
          0 CRC, 0 frame, - overruns, 0 aborts
          - ignored, - parity errors
 Output (total): 1395522 packets, 183608303 bytes
          13 broadcasts, 1273860 multicasts, 0 pauses
 Output (normal): 1395522 packets, - bytes
          13 broadcasts, 1273860 multicasts, 0 pauses
 Output: 0 output errors, - underruns, 1 buffer failures
          0 aborts, 0 deferred, 0 collisions, 0 late collisions
          0 lost carrier, - no carrier
```

Table 12 Description on the fields of the display interface command (in bridge mode)

Field	Description
Ethernet1/0 current state	Current physical link state of the Ethernet interface
IP Packet Frame Type	Frame type of the Ethernet interface
Hardware address	Hardware address
Description	Description of the interface
Loopback is not set	Loopback is not configured

Table 12 Description on the fields of the display interface command (in bridge mode)

Field	Description
Unknown-speed mode	Unknown-speed mode, in which mode speed is negotiated between the current host and the peer
unknown-duplex mode	unknown-duplex mode, in which mode speed is negotiated between the current host and the peer
Link speed type is autonegotiation	Link speed type is autonegotiation
link duplex type is autonegotiation	Link duplex type is autonegotiation
Flow-control is not enabled	Flow-control is not enabled
The Maximum Frame Length	The maximum frame length allowed on an interface
Broadcast-suppression ratio(%)	Broadcast storm suppression ratio (the maximum ratio of allowed number of broadcast packets to overall traffic through an interface)
Unicast MAX-ratio	Unicast storm suppression ratio (the maximum ratio of allowed number of unknown unicast packets to overall traffic over an interface)
Multicast MAX-ratio	Multicast storm suppression ratio (the maximum ratio of allowed number of multicast packets to overall traffic through an interface)
PVID	Default VLAN ID
Mdi type	Cable type
Port link-type	Interface link type, which could be access, trunk, and hybrid.
Tagged VLAN ID	Identify the VLANs that need Tag markers
Untagged VLAN ID	Identify the VLANs that do not need Tag markers
Last 300 seconds input:	Average input rate over the last 300 seconds, among which: ■ **packets/sec** indicates the average input rate in terms of the average number of the packets received per second. ■ **bytes/sec** indicates the average input rate in terms of the average number of bytes received per second. ■ **x%** indicates the percentage of the average input rate to the total bandwidth, where **-** indicates that the rate is greater than the maximum value that can be displayed.
Last 300 seconds output	Average output rate over the last 300 seconds, among which: ■ **packets/sec** indicates the average output rate in terms of the average number of the packets output per second. ■ **bytes/sec** indicates the average output rate in terms of the average number of bytes output per second. ■ **x%** indicates the percentage of the average output rate to the total bandwidth, where **-** indicates that the rate is greater than the maximum value that can be displayed.

Table 12 Description on the fields of the display interface command (in bridge mode)

Field	Description
Input (total): Input (normal): Input: Output (total): Output (normal): Output:	Error statistics on the interface inbound and outbound packets, underscore indicates that the corresponding entry is invalid

duplex

Syntax **duplex** { **auto** | **full** | **half** }

undo duplex

View Ethernet interface view

Parameter **auto**: Indicates that the interface is in an auto-negotiation state.

full: Indicates that the interface is in a full-duplex state.

half: Indicates that the interface is in a half-duplex state.

Description Use the **duplex** command to configure the duplex mode for an Ethernet interface.

Use the **undo duplex** command to restore the duplex mode for an Ethernet interface to the default.

By default, the duplex mode for an Ethernet interface is auto.

Related command: **speed**.

Example # Configure the interface Ethernet 1/0 to work in full-duplex mode.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] duplex full
```

flow-control

Syntax **flow-control**

undo flow-control

View Ethernet interface view

Parameter None

Description Use the **flow-control** command to turn on flow control on an Ethernet interface.

Use the **undo flow-control** command to turn off flow control on an Ethernet interface.

By default, flow control on an Ethernet interface is turned off.

The flow control can be implemented on the local Ethernet interface only when the flow control function is enabled on both the local and peer devices.

Example # Turn on flow control on interface Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] flow-control
```

interface

Syntax **interface** *interface-type interface-number*

View System view

Parameter *interface-type interface-number*: Interface type and interface number.

- *Interface is identified by slot number/interface number, for example, Ethernet 1/0 can be represented as 1/0.*
- *For ease of user input, interface type can be abbreviated so long as it does not cause any confusion, for example, interface Ethernet 1/0 can be abbreviated as e1/0.*

Description Use the **interface** command to enter the related interface view.

Example # Enter interface view of the interface Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0]
```

loopback

Syntax **loopback** { **external** | **internal** }

undo loopback

View Ethernet interface view

Parameter **external**: Enables external loopback testing on an Ethernet interface. The support for this keyword varies with device models.

internal: Enables internal loopback testing on an Ethernet interface. The support for this keyword varies with device models.

Description Use the **loopback** command to enable Ethernet interface loopback testing.

Use the **undo loopback** command to disable Ethernet interface loopback testing.

By default, Ethernet interface loopback testing is disabled.

- *The support for these two commands varies with device models.*
- *Ethernet interface loopback testing should be enabled while testing certain functionalities, such as during the initial identification of any network failure.*
- *While enabled, Ethernet interface loopback testing will work in a full-duplex mode. The interface will return to its original state upon completion of the loopback testing.*

Example # Configure to enable loopback testing on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] loopback internal
```

port link-mode

Syntax **port link-mode { bridge | route }**

undo port link-mode

View Ethernet interface view

Parameter **bridge**: Works in bridge mode.

route: Works in route mode.

Description Use the **port link-mode** command to change the working mode of the Ethernet interface.

Use the **undo port link-mode** command to restore the original working mode.

According to the layer at which the device processes received data packets, Ethernet interfaces can work in bridge or route mode. For a device, some interfaces can work only in bridge mode, some can work only in route mode, and others can work in bridge mode or route mode. This command is only applicable to Ethernet interfaces whose working mode can be changed.

CAUTION:

- *Only 4SIC-FSW interface cards, 9DSIC-FSW interface cards, and the fixed switching interfaces of 20-21 routers support work mode switching.*
- *On an MSR series router, you can change the working mode to route mode for up to two Ethernet interfaces.*
- *After the working mode is changed, all parameters of the Ethernet interface will be restored to the defaults in the current working mode.*

Example # Configure Ethernet1/0 to work in bridge mode.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] display this
#
interface Ethernet1/0
 port link-mode route
#
return
[Sysname-Ethernet1/0] port link-mode bridge
[Sysname-Ethernet1/0] display this
#
interface Ethernet1/0
 port link-mode bridge
#
return
```

*Use the **display this** command to display the current configurations.*

reset counters interface

Syntax **reset counters interface** [*interface-type* [*interface-number*]]

View User view

Parameter *interface-type*: Interface type.

interface-number: Interface number.

Description Use the **reset counters interface** command to reset statistics for a specified interface.

To sample network traffic within a period of time for an interface, you need to reset the original interface statistics.

- If neither interface type nor interface number is specified, all interface information will be reset;
- If only interface type is specified, then only information of this particular type of interface will be reset.
- If both interface type and interface number are specified, then only information of the specified interface will be reset.

Example # Clear the statistics of Ethernet 1/0.

```
<Sysname> reset counters interface ethernet 1/0
```

shutdown

Syntax **shutdown**

undo shutdown

View Ethernet interface view

Parameter None

Description Use the **shutdown** command to shut down an Ethernet interface.

Use the **undo shutdown** command to turn on Ethernet interface.

In certain circumstances, modification to the interface parameters does not immediately take effect, and therefore, you need to shut down the relative interface to make the modification work.

Example # Shut down the interface Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] shutdown
```

Turn on the interface Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] undo shutdown
```

speed

Syntax **speed** { **10** | **100** | **1000** | **auto** }

undo speed

View Ethernet interface view

Parameter **10**: Indicates that the interface rate is 10 Mbps.

100: Indicates that the interface rate is 100 Mbps.

1000: Indicates that the interface rate is 1000 Mbps.

auto: Indicates that the interface rate is in the auto-negotiation state.

Description Use the **speed** command to configure Ethernet interface data rate.

Use the **undo speed** command to restore Ethernet interface data rate.

By default, Ethernet interface data rate is automatically negotiated between peer Ethernet interfaces.

Note that the following:

- The Combo port does not support the **speed** command.
- The **speed 1000** command is only applicable to Gigabit Ethernet interface.

Related command: **duplex**.

Example # Configure data rate for the interface Ethernet 1/0 to 100 Mbps.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] speed 100
```

9 CONFIGURATION COMMANDS FOR ETHERNET INTERFACES IN BRIDGE MODE

broadcast-suppression

Syntax **broadcast-suppression** { *ratio* | **pps** *max-pps* }

undo broadcast-suppression

View Ethernet interface view, port group view

Parameter *ratio*: Maximal ratio of broadcast traffic to the total transmission capability of an Ethernet interface. Currently, this argument can only be set to 100.

pps *max-pps*: Specifies the maximal broadcast packet number per second for an Ethernet interface, in pps, representing packets per second. Currently, the *max-pps* argument can only be 190, 380, 760, 1488, 2976, 5952, or 11904.

Description Use the **broadcast-suppression** command to configure a broadcast storm suppression ratio.

Use the **undo broadcast-suppression** command to restore the default broadcast storm suppression ratio.

By default, all broadcast traffic is allowed to go through an Ethernet interface, that is, broadcast traffic is not suppressed.

If you execute this command in Ethernet interface view, the configuration takes effect only on the current interface. If you execute this command in port group view, the configuration takes effect on all the ports in the port group.

Note that when broadcast traffic exceeds the maximum value configured, the system will discard the extra packets so that the broadcast traffic ratio falls below the limit to ensure that the network functions properly.

If you set different suppression ratios in Ethernet interface view or port group view repeatedly, the last configuration takes effect.

Example # Set the maximum broadcast traffic allowed on Ethernet1/0 to 5952 pps.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] broadcast-suppression pps 5952
```

display loopback-detection

Syntax **display loopback-detection**

View Any view

Parameter None

Description Use the **display loopback-detection** command to display loopback detection information on a port

If loopback detection is already enabled, this command will also display the detection interval and information on the ports currently detected with a loopback.

Example # Display loopback detection information on a port.

```
<Sysname> display loopback-detection
Loopback-detection is running
Detection interval time is 30 seconds
There is no port existing loopback link
```

Table 13 Description on the fields of the display loopback-detection command.

Field	Description
Loopback-detection is running	Loopback-detection is running
Detection interval time is 30 seconds	Detection interval is 30 seconds
There is no port existing loopback link	No port is currently being detected with a loopback

display port

Syntax **display port** { **hybrid** | **trunk** }

View Any view

Parameter **hybrid**: Displays the current Hybrid port(s).

trunk: Displays the current Trunk port(s).

Description Use the **display port** command to display information on the current ports of a specified type, including port name, default VLAN ID, and the VLAN ID of VLANs that the ports can pass through.

Example # Display the current Hybrid port(s).

```
<Sysname> display port hybrid
Interface            PVID  VLAN passing
Eth1/4             100   Tagged:  1000, 1002, 1500, 1600-1611, 2000,
                                  2555-2558, 3000, 4000
```

```
                                    Untagged:1, 10, 15, 18, 20-30, 44, 55, 67, 100,
                                             150-160, 200, 255, 286, 300-302
```

Display the current Trunk port(s).

```
<Sysname> display port trunk
Interface            PVID  VLAN passing
Eth1/8               2     1-4, 6-100, 145, 177, 189-200, 244, 289, 400,
                           555, 600-611, 1000, 2006-2008
```

Table 14 Description on the fields of the display port command.

Field	Description
Interface	Interface name
PVID	Default VLAN ID of the interface
VLAN passing	VLAN ID of VLANs that the ports can pass through

display port-group manual

Syntax **display port-group manual** [**all** | **name** *port-group-name*]

View Any view

Parameters **all**: Specifies all the manual port groups.

name *port-group-name*: Specifies the name of a manual port group, a string of 1 to 32 characters.

Description Use the **display port-group manual** command to display the information about a manual port group or all the manual port groups.

- If you provide the *port-group-name* argument, this command displays the details of a specified manual port group, including its name and the Ethernet interfaces included.
- If you provide the **all** keyword, this command displays the details of all the manual port groups, including their names and the Ethernet interfaces included.
- If no argument or keyword is specified, this command displays the names of all the existing manual port groups.

Examples # Display the names of all the manual port groups.

```
<Sysname> display port-group manual
The following manual port group exist(s):
group1                                    group2
```

Display the details of all the manual port groups.

```
<Sysname> display port-group manual all
Member of group1:
    Ethernet1/0            Ethernet1/1            Ethernet1/2
    Ethernet1/3            Ethernet1/4            Ethernet1/5
    Ethernet1/6            Ethernet1/7            Ethernet2/0
    Ethernet2/1
```

```
Member of group2:
None
```

Display the details of the manual port group named **group 1**.

```
<Sysname> display port-group manual name group1
Member of group1:
    Ethernet1/0             Ethernet1/1             Ethernet1/2
    Ethernet1/3             Ethernet1/4             Ethernet1/5
    Ethernet1/6             Ethernet1/7             Ethernet2/0
```

Table 15 Description on the fields of the display port-group manual command

Field	Description
Member of group	Member ports of the manual port group

flow-interval

Syntax **flow-interval** *interval*

undo flow-interval

View System view

Parameter *interval*: Time interval at which interface statistics is collected, in the range of 5 to 300 seconds, a multiple of 5. The system default is 300 seconds.

Description Use the **flow-interval** command to configure the time interval for collecting interface statistics.

Use the **undo flow-interval** command to restore the default interval.

Example # Set the time interval for collecting interface statistics to 100 seconds.

```
<Sysname> system-view
[Sysname] flow-interval 100
```

group-member

Syntax **group-member** *interface-list*

undo group-member *interface-list*

View Port group view

Parameters *interface-list*: Ethernet interface list, in the form of { *interface-type interface-number* [**to** *interface-type interface-number*] } &<1-10>, where &<1-10> indicates that you can specify up to 10 interfaces or interface ranges

Description Use the **group-member** command to add specified Ethernet interfaces to a manual port group.

Use the **undo group-member** command to remove specified Ethernet interfaces from a manual port group.

By default, a manual port group contains no Ethernet interface.

Examples # Add interface Ethernet 1/0 to the manual port group named **group 1**.

```
<Sysname> system-view
[Sysname] port-group manual group1
[Sysname-port-group-manual-group1] group-member ethernet 1/0
```

loopback-detection control enable

Syntax **loopback-detection control enable**

undo loopback-detection control enable

View Ethernet interface view

Parameter None

Description Use the **loopback-detection control enable** command to enable loopback detection for a Trunk port or Hybrid port.

Use the **undo loopback-detection control enable** command to restore the default.

By default, loopback detection for a Trunk port or Hybrid port is disabled.

- When the loopback detection is enabled, if a port has been detected with loopback, it will be shutdown. A Trap message will be sent to the terminal and the corresponding MAC address forwarding entries will be deleted.
- When the loopback detection is disabled, if a port has been detected with loopback, a Trap message will be sent to the terminal. The port is still working properly.

By default, loopback detection for Trunk port and Hybrid port is disabled.

Note that this command is inapplicable to an Access port as its loopback detection is enabled by default.

Example # Enable loopback detection for the Trunk port Ethernet 1/0.

```
<Sysname> system-view
[Sysname] loopback-detection enable
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port link-type trunk
[Sysname-Ethernet1/0] loopback-detection enable
[Sysname-Ethernet1/0] loopback-detection control enable
```

loopback-detection enable

Syntax **loopback-detection enable**

undo loopback-detection enable

View System view/Ethernet interface view

Parameter None

Description Use the **loopback-detection enable** command to enable loopback detection globally or on a specified port.

Use the **undo loopback-detection enable** command to disable loopback detection globally or on a specified port.

By default, loopback detection is disabled for an Access, Trunk, or Hybrid port.

- If an Access port has been detected with loopback, it will be shutdown. A Trap message will be sent to the terminal and the corresponding MAC address If a Trunk port or Hybrid port has been detected with loopback, a Trunk message will be sent to the terminal. They will be shutdown if the loopback testing function is enabled on them. In addition, a Trap message will be sent to the terminal and the corresponding MAC address forwarding entries will be deleted.

Related command: **loopback-detection control enable**.

CAUTION:

- *Loopback detection on a given port is enabled only after the **loopback-detection enable** command has been issued in both system view and the **interface** view of the port.*
- *Loopback detection on all ports will be disabled after the issuing of the undo **loopback-detection enable** command under system view.*

Example # Enable loopback detection on the interface Ethernet 1/0.

```
<Sysname> system-view
[Sysname] loopback-detection enable
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] loopback-detection enable
```

loopback-detection interval-time

Syntax **loopback-detection interval-time** *time*

undo loopback-detection interval-time

View System view

Parameter *time*: Time interval in seconds for port loopback detection, in the range of 5 to 300.

Description Use the **loopback-detection interval-time** command to configure time interval for port loopback detection.

Use the **undo loopback-detection interval-time** command to restore the default time interval for port loopback detection, which is 30 seconds.

Related command: **display loopback-detection**.

Example # Set the time interval for port loopback detection to 10 seconds.

```
<Sysname> system-view
[Sysname] loopback-detection interval-time 10
```

loopback-detection per-vlan enable

Syntax **loopback-detection per-vlan enable**

undo loopback-detection per-vlan enable

View Ethernet interface view

Parameter None

Description Use the **loopback-detection per-vlan enable** command to enable loopback detection in all VLANs with Trunk ports or Hybrid ports.

Use the **undo loopback-detection per-vlan enable** command to enable loopback detection in the default VLAN with Trunk ports or Hybrid ports.

By default, loopback detection is only enabled in the default VLAN(s) with Trunk ports or Hybrid ports.

Note that the **loopback-detection per-vlan enable** command is not applicable to access ports.

Example # Enable loopback detection in all VLANs to which the Hybrid port Ethernet 1/0 belong.

```
<Sysname> system-view
[Sysname] loopback-detection enable
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] loopback-detection enable
[Sysname-Ethernet1/0] port link-type trunk
[Sysname-Ethernet1/0] loopback-detection per-vlan enable

[Sysname-Ethernet1/0] loopback-detection per-vlan enable
```

mdi

Syntax **mdi** { **across** | **auto** | **normal** }

undo mdi

View Ethernet interface view

Parameter **across**: Specifies cross-over cables for the Ethernet interface.

auto: Configures the Ethernet interface to be auto-sensing for the cable type.

normal: Specifies straight-through cables for the Ethernet interface.

Description Use the **mdi** command to configure the cable type that can be sensed by an Ethernet interface.

Use the **undo mdi** command to restore the system default.

By default, an Ethernet interface senses the type of the network cable connected to it automatically.

The optical port of a Combo port does not support this command.

Example # Configure the interface Ethernet 1/0 to use cross over cable.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] mdi across
```

multicast-suppression

Syntax **multicast-suppression** { *ratio* | **pps** *max-pps* }

undo multicast-suppression

View Ethernet interface view, port group view

Parameter *ratio*: Maximal ratio of multicast traffic to the total transmission capability of an Ethernet interface, in the range of 1 to 100. Currently, this argument can only be set to 100.

pps *max-pps*: Specifies the maximal number of multicast packets passing an Ethernet interface per second, in pps, representing packets per second. Currently, the *max-pps* argument can only be 190, 380, 760, 1488, 2976, 5952, or 11904.

Description Use the **multicast-suppression** command to configure multicast storm suppression ratio on an interface.

Use the **undo multicast-suppression** command to restore default multicast suppression ratio.

By default, all multicast traffic is allowed to go through an Ethernet interface, that is, multicast traffic is not suppressed.

If you execute this command in Ethernet interface view, the configuration takes effect only on the current interface. If you execute this command in port group view, the configuration takes effect on all ports in the port group.

Note that when multicast traffic exceeds the maximum value configured, the system will discard the extra packets so that the multicast traffic ratio can drop below the limit to ensure that the network functions properly.

If you set different suppression ratios in Ethernet interface view or port group view repeatedly, the last configuration takes effect.

Example # Set the maximum multicast traffic allowed on Ethernet 1/0 to 5952 PPS.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-GigabitEthernet1/0] multicast-suppression pps 5952
```

port-group

Syntax **port-group** { **manual** *port-group-name* | **aggregation** *agg-id* }

undo port-group manual *port-group-name*

View System view

Parameter **manual** *port-group-name*: Specifies the name of a manual port group, a string of 1 to 32 characters.

aggregation *agg-id*: Specifies the ID of an existing port aggregation group. You can use the **display link-aggregation summary** command to display the brief information of all the existing port aggregation groups. The support for this keyword-argument combination varies with device models.

Description Use the **port-group manual** command to create a manual port group and enter manual port group view.

Use the **port-group aggregation** command to enter aggregation group view.

Use the **undo port-group manual** command to remove a manual port group.

By default, no manual port group is created.

Example # Enter manual port group 1 view.

```
<Sysname> system-view
[Sysname] port-group manual group1
```

unicast-suppression

Syntax **unicast-suppression** { *ratio* | **pps** *max-pps* }

undo unicast-suppression

View Ethernet interface view, port group view

Parameter *ratio*: Maximal ratio of unicast traffic to the total transmission capability of an Ethernet interface, in the range of 1 to 100. The smaller the ratio is, the less unicast traffic is allowed through the interface.

pps *max-pps*: Specifies the maximal number of unknown unicast packets passing through an Ethernet interface per second. The *max-pps* argument ranges from 1 to 148,810, in pps, representing packets per second.

Description Use the **unicast-suppression** command to configure a unicast storm suppression ratio.

Use the **undo unicast-suppression** command to restore the default unicast suppression ratio.

By default, all unicast traffic is allowed to go through an Ethernet interface, that is, unicast traffic is not suppressed.

If you execute this command in Ethernet interface view, the configuration takes effect only on the current interface. If you execute this command in port group view, the configuration takes effect on all ports in the port group.

Note that when unicast traffic exceeds the maximum value configured, the system will discard the extra packets so that the unknown unicast traffic ratio can drop below the limit to ensure that the network functions properly.

Currently, these two commands are not supported.

Example # Allow unicast traffic equivalent to 20% of the total transmission capability of the interface to pass through Ethernet 1/0 and suppress the excessive unknown unicast packets.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] unicast-suppression 20
```

virtual-cable-test

Syntax **virtual-cable-test**

View Ethernet interface view

Parameter None

Description Use the **virtual-cable-test** command to enable the virtual cable test for an Ethernet interface and to display the testing result. The tested items include:

- Cable status: Could be normal, abnormal, abnormal-open, abnormal-short, and failure;
- Cable length;
- Pair Impedance mismatch;
- Pair skew;
- Pair swap;
- Pair polarity;
- Insertion loss;
- Return loss;
- Near-end crosstalk.

By default, virtual cable test is disabled.

Note:

- When the cable is functioning properly, the cable length in the test result represents the total cable length;
- When the cable is not functioning properly, the cable length in the test result represents the length from the current interface to the failed position.

- *The optical interface of a Combo port does not support this command.*
- *A link in the up state goes down and then up automatically if you execute this command on one of the Ethernet interfaces forming the link.*

Example # Enable the virtual cable test for the interface Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] virtual-cable-test
Cable status: abnormal(open), 7 metres
Pair Impedance mismatch: yes
Pair skew: 4294967294 ns
Pair swap: swap
Pair polarity: normal
Insertion loss: 7 db
Return loss: 7 db
Near-end crosstalk: 7 db
```

10 CONFIGURATION COMMANDS FOR ETHERNET INTERFACES IN ROUTE MODE

mtu

Syntax **mtu** *size*

undo mtu

View Ethernet interface view

Parameter *size*: The value of Maximum Transmission Unit (MTU for short), which varies by interface type and defaults to 1,500 bytes.

- Fast Ethernet: (FE for short): in the range of 46 bytes to 1,560 bytes
- GigabitEthernet (GE for short) or 10 GE: in the range of 46 bytes to 16,384 bytes, with a default value of 1,500 bytes.

Description Use the **mtu** command to configure MTU value.

Use the **undo mtu** command to restore MTU value.

Limited to the QoS queue length (for example, the default length of an FIFO queue is 75), too small an MTU will result in too many fragments, which will be discarded from the QoS queue. In this case, you can increase MTU or QoS queue length properly. In Ethernet interface view, you can use ***qos fifo queue-length*** *to change the QoS queue length. For detailed configurations, see "qos fifo queue-length" on page 1809.*

Example # Configure MTU for Ethernet1/0 to be 1,000 bytes.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] mtu 1000
```

timer hold

Syntax **timer hold** *seconds*

undo timer hold

View Ethernet interface view

Parameter *seconds*: Time interval in seconds for link suppression, in the range of 0 to 32,767. A value 0 represents the link test is disabled.

Description Use the **timer hold** command to configure Layer 3 Ethernet interface link-layer-state change suppression time.

Use the **undo timer hold** command to restore the default suppression time.

By default, Layer 3 Ethernet link-layer-state change suppression time is set to 10 seconds. Peer Ethernet interfaces have the same suppression time. If both sides set their suppression time to 0, the link-layer-state change suppression time is disabled.

You can increase the polling interval to reduce negative effect on network traffic due to the network time lag or heavy congestion.

Example # Configure the link state change suppression time for the interface Ethernet 1/0 to 20 seconds.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] timer hold 20
```

11 FUNDAMENTAL SERIAL INTERFACE CONFIGURATION COMMANDS

async mode

Syntax **async mode** { **flow** | **protocol** }

undo async mode

View Asynchronous serial interface view, AUX interface view, AM interface view

Parameter **flow**: Flow mode, also known as interactive mode. In this mode, the two ends interact attempting to set up a link after the physical link is set up. During this process, the calling party sends configuration commands to the called party (this is equal to the operation of manually inputting configuration commands at the remote end), sets the link layer protocol operating parameters of the called party, and then sets up the link. This approach normally applies to man-machine interaction.

protocol: Protocol mode. In this mode, the interface uses configured link layer protocol parameters to set up link with the remote end after its physical link is set up.

Description Use the **async mode** command to set the operating mode of the current interface.

Use the **undo async mode** command to restore the default.

By default, an asynchronous serial interface operates in protocol mode and an AUX interface operates in flow mode.

You can configure PPP when the asynchronous serial interface is working in flow mode, but the configuration does not take effect. The PPP configuration takes effect only after you change the operating mode of the interface to protocol.

Example # Set asynchronous serial interface 1/0 to operate in flow mode.

```
<Sysname> system-view
[Sysname] interface async 1/0
[Sysname-async1/0] async mode flow
```

baudrate

Syntax **baudrate** *baudrate*

undo baudrate

View Serial interface view

Parameter *baudrate*: Baud rate (in bps) to be set for a serial interface.

Description Use the **baudrate** command to set the baud rate for a serial interface.

Use the **undo baudrate** command to restore the default.

By default, the baud rate is 64,000 bps on a synchronous serial interface.

The following are the baud rates available with synchronous serial interfaces:

1,200 bps, 2,400 bps, 4,800 bps, 9,600 bps, 19,200 bps, 38,400 bps, 56,000 bps, 57,600 bps, 64,000 bps, 72,000 bps, 115,200 bps, 128,000 bps, 192,000 bps, 256,000 bps, 384,000 bps, 512,000 bps, 1,024,000 bps, 2,048,000 bps, and 4,096,000 bps.

The baud rate range available with synchronous serial interfaces depends on the applied physical electric specifications.

- For V.24 DTE/DCE, the baud rate available ranges from 1,200 bps to 64,000 bps.
- For V.35 DCE/DCE, X.21 DTE/DCE, EIA/TIA-449 DTE/DCE, and EIA-530 DTE/DCE, the baud rate available ranges from 1,200 bps to 4,096,000 bps.

CAUTION:

- *Take the physical electric specifications of the cable into consideration when setting the baud rate for a serial interface.*
- *The baud rate adopted by a DCE-DTE pair is determined by the DCE.*

Example # Set the baud rate of synchronous serial interface 1/0 at DCE side to 115,200 bps.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] baudrate 115200
```

clock (serial interface view)

Syntax **clock** { **dteclk1** | **dteclk2** | **dteclk3** | **dteclk4** | **dteclkauto** }

undo clock

View Serial interface view

Parameter **dteclk1**: Sets the interface clock selection mode to DTE clock option 1.

dteclk2: Sets the interface clock selection mode to DTE clock option 2.

dteclk3: Sets the interface clock selection mode to DTE clock option 3.

dteclk4: Sets the interface clock selection mode to DTE clock option 4.

dteclkauto: Sets the interface clock selection mode to DTE autonegotiation.

Description

Use the **clock** command to set clock selection mode for the synchronous serial interface.

Use the **undo clock** command to restore the default.

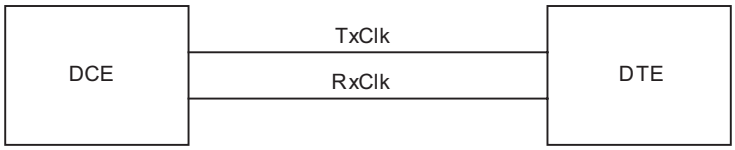
By default, the DTE-side clock on synchronous serial interfaces is DTE clock option 1 (**dteclk1**).

A synchronous serial interface can operate as DCE or DTE.

- As DCE, the interface provides DCEclk clock to the DTE.
- As DTE, the interface accepts the clock provided by the DCE. As transmitting and receiving clocks of synchronization devices are independent, the receiving clock of a DTE device can be either the transmitting or receiving clock of the DCE device, so is the transmitting clock. Therefore, four clock options are available for a DTE device.

See Figure 1:

Figure 1 Select a clock for a synchronous serial interface



In the figure, "TxClk" represents transmitting clock and "RxClk" receiving clock.

The following table gives the four clock selection options.

Table 16 Clock options available for a synchronous serial interface working as DTE

Clock selection option	Description
DTEclk1	TxClk = TxClk, RxClk = RxClk
DTEclk2	TxClk = TxClk, RxClk = TxClk
DTEclk3	TxClk = RxClk, RxClk = TxClk
DTEclk4	TxClk = RxClk, RxClk = RxClk

In the table, the clock ahead of the equal sign (=) is the DTE clock and the one behind is the DCE clock.

Example

Set the synchronous serial interface working as DTE to use the clock selection option **dteclk2**.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] clock dteclk2
```

code nrzi

Syntax **code nrzi**

undo code

View Synchronous serial interface view

Parameter None

Description Use the **code nrzi** command to set the digital signal coding format to none-return-to-zero-inverse (NRZI) on the synchronous serial interface.

Use the **undo code** command to restore the default, that is, NRZ.

Example # Set the digital signal coding format to NRZI on synchronous serial interface 1/0.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] code nrzi
```

country-code

Syntax **country-code** *area-name*

undo country-code

View Asynchronous serial interface view, AM interface view

Parameter *area-name*: Area name, which can be australia, austria, belgium, brazil, bulgaria, canada, china, czechoslovakia, denmark, finland, france, germany, greece, hongkong, hungary, india, ireland, israel, italy, japan, korea, luxembourg, malaysia, mexico, netherlands, new-zealand, norway, philippines, poland, portugal, russia, singapore, southafrica, spain, sweden, switzerland, taiwan, united-kingdom, and united-states.

Description Use the **country-code** command to set the coding format of the modem connected to the asynchronous serial or AM interface.

Use the **undo country-code** command to restore the default, that is, united-states.

You may use this command to adapt to the modem coding formats in different countries and areas.

Before you can use this command on an asynchronous serial interface, you must first enable the **modem** command.

Example # Set the country-code to china.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] country-code china
```

crc

Syntax **crc** { **16** | **32** | **none** }

undo crc

View Synchronous serial interface view

Parameter **16**: Specifies 16-bit CRC.

32: Specifies 32-bit CRC.

none: Disables CRC.

Description Use the **crc** command to set the CRC mode.

Use the **undo crc** command to restore the default.

By default, 16-bit CRC is adopted.

These two commands are not available to sub-serial interfaces and synchronous/asynchronous serial interfaces operating as asynchronous interfaces.

Example # Configure to adopt 32-bit CRC.

```
<Sysname> system-view
[Sysname] interface serial 0/0/0
[Sysname-Serial0/0/0] crc 32
```

detect

Syntax

1 Asynchronous serial interface

detect dsr-dtr

undo detect dsr-dtr

2 Synchronous serial interface

detect { **dcd** | **dsr-dtr** }

undo detect { **dcd** | **dsr-dtr** }

View Synchronous serial interface view, asynchronous serial interface view

Parameter **dsr-dtr**: Detects DSR (data set ready) and DTR (data terminal ready) signals of DSU/CSU (data service unit/channel service unit).

dcd: Detects the DCD (data carrier detect) signal of the DSU/CSU on the serial interface.

Description Use the **detect** command to enable data carrier detection as well as level detection on the serial interface.

Use the **undo detect** command to disable data carrier detection as well as level detection on the serial interface.

By default, data carrier and level detection is enabled on serial interfaces.

If level detection is disabled on an asynchronous serial interface, the system automatically reports that the state of the serial interface is up with both DTR and DSR being up without detecting whether a cable is connected. If level detection is enabled on the interface, the system detects the DSR signal in addition to the external cable. The interface is regarded up only when the detected DSR signal is valid. Otherwise, it is regarded down.

When determining whether a synchronous serial interface is up or down, the system by default detects the DSR signal, DCD signal, and presence of cable connection. Only when the three signals are all valid will the interface be regarded up. If level detection is disabled, the system considers that the interface is up with both DTR and DSR being up after detecting the cable connection.

*The **modem** command and the **undo detect dsr-dtr** command are mutually exclusive.*

Example # Enable data carrier detection on synchronous serial interface 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial1/0] detect dcd
```

eliminate-pulse

Syntax **eliminate-pulse**

undo eliminate-pulse

View Asynchronous serial interface view

Parameter None

Description Use the **eliminate-pulse** command to eliminate the pulses with a width less than 3.472 us, thus increasing signal reliability. This is useful when the line is seriously interfered.

Use the **undo eliminate-pulse** command to restore the default, eliminating the pulses with a width less than 1.472 us.

When the baud rate of the interface is 115,200 bps, you cannot configure this command. After you configure this command, the baud rate of the interface cannot be set to 115,200 bps.

This command is restricted to the 8ASE and 16ASE interface cards and modules.

Example # Eliminate the pulses with a width less than 3.472 us on interface Async 1/0.

```
<Sysname> system-view
[Sysname] interface async 1/0
[Sysname-Async1/0] eliminate-pulse
```

idle-mark

Syntax **idle-mark**

undo idle-mark

View Synchronous serial interface view

Parameter None

Description Use the **idle-mark** command to set the line idle code of the synchronous serial interface to 0xFF.

Use the **undo idle-mark** command to restore the default, that is, 0x7E.

In most cases, a synchronous serial interface uses 0x7E to identify the idle state of the line. You may need to set the line idle code to 0xFF however to interoperate with devices that use 0xFF (high level of all ones) as line idle code.

Example # Set the line idle code of synchronous serial interface 2/0 to 0xFF.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial1/0] idle-mark
```

invert receive-clock

Syntax **invert receive-clock**

undo invert receive-clock

View Serial interface view

Parameter None

Description Use the **invert receive-clock** command to invert the receive-clock signal on the DTE-side synchronous serial interface.

Use the **undo invert transmit-clock** command to restore the default.

By default, receive-clock signal inversion is disabled on DTE-side synchronous serial interfaces.

Sometimes, you may need to invert the receive-clock signal on a DTE-side serial interface to eliminate the half clock-period delay on the line. This command is necessary only for some special DCE devices. In common applications, clock must not be inverted.

Related command: **physical-mode**, **invert transmit-clock**, **clock (serial interface view)**.

Example # Invert the receive-clock on DTE-side synchronous serial interface 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial1/0] invert receive-clock
```

invert transmit-clock

Syntax **invert transmit-clock**

undo invert transmit-clock

View Serial interface view

Parameter None

Description Use the **invert transmit-clock** command to invert the transmit-clock signal on the DTE-side synchronous serial interface.

Use the **undo invert transmit-clock** command to restore the default.

By default, transmit-clock signal inversion is disabled on DTE-side synchronous serial interfaces.

Sometimes, you may need to invert the receive-clock signal on a DTE-side serial interface to eliminate the half clock-period delay on the line. This command is necessary only for some special DCE devices. In common applications, clock must not be inverted.

Related command: **physical-mode**, **invert receive-clock**, **clock (serial interface view)**.

Example # Invert the transmit-clock on DTE-side synchronous serial interface 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial1/0] invert transmit-clock
```

loopback

Syntax **loopback**

undo loopback

View Serial interface view, AUX interface view, AM interface view

Parameter None

Description Use the **loopback** command to enable internal loopback on the serial interface.

Use the **undo loopback** command to restore the default.

By default, loopback is disabled.

Loopback is intended for test use. Disable it otherwise.

Example # Enable internal loopback on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial1/0] loopback
```

mtu (on serial interfaces)

Syntax **mtu** *size*

undo mtu

View Serial interface view, AUX interface view, AM interface view, USB interface view

Parameter *size*: Maximum transmission unit (MTU) to be set for a serial interface, in the range 128 to 1,500 (in bytes).

Description Use the **mtu** command to set the MTU for a serial interface.

Use the **undo mtu** command to restore the default.

By default, the MTU of a serial interface is 1,500 bytes.

Due to the length of Qos queue, a packet may be discarded if the MTU is relatively small and the packet is segmented into too many fragments. You can increase the Qos queue length to avoid this situation. To do so, use the **qos fifo queue-length** command in interface view. For details, refer to the "FIFO Queuing Configuration Commands" on page 1809.

The MTU setting can affect IP packets assembly and fragmentation on the interface.

Example # Set the MTU of interface Serial 2/0 to 1,200 bytes.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial1/0] mtu 1200
```

physical-mode

Syntax **physical-mode** { **async** | **sync** }

View Serial interface view

Parameter **async**: Sets the synchronous/asynchronous serial interface to operate in asynchronous mode.

sync: Sets the synchronous/asynchronous serial interface to operate in synchronous mode.

Description Use the **physical-mode** command to set the operating mode of the synchronous/asynchronous serial interface.

By default, synchronous/asynchronous serial interfaces are operating in synchronous mode.

Example # Set synchronous/asynchronous serial interface 2/0 to operate in asynchronous mode.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial1/0] physical-mode async
```

phy-mru

Syntax **phy-mru** *size*

undo phy-mru

View Asynchronous serial interface view, AUX interface view

Parameter *size*: Maximum receive unit (MRU) to be set, in the range 4 to 1,700 (in bytes).

Description Use the **phy-mru** command to set the MRU for an asynchronous serial interface operating in flow mode.

Use the **undo phy-mru** command to restore the default.

By default, the MRU of an asynchronous serial interface is 1,700 bytes.

Note that these two commands only apply to interfaces operating in the asynchronous flow mode.

Example # Set the MRU of interface serial 2/0 to 1,500 bytes (assuming that the interface is an asynchronous serial interface and operates in flow mode).

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] physical-mode async
[Sysname-Serial2/0] async mode flow
[Sysname-Serial2/0] phy-mru 1500
```

reverse-rts

Syntax **reverse-rts**

undo reverse-rts

View Synchronous serial interface view

Parameter None

Description Use the **reverse-rts** command to reverse RTS signal for debugging purpose.

Use the **undo reverse-rts** command to restore the default.

By default, RTS signal reverse is disabled.

This command is used in hardware flow control where the remote is not allowed to send data when the local end is doing that.

Example # Reverse RTS signal.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] reverse-rts
```

timer hold

Syntax **timer hold** *seconds*

undo timer hold

View Serial interface view, AUX interface view, AM interface view, USB interface view

Parameter *Seconds*: Link state polling interval (in seconds) to be set, in the range 1 to 32,767.

Description Use the **timer hold** command to set the link state polling interval.

Use the **undo timer hold** command to restore the default.

By default, the link state polling interval is 10 second.

Example # Set the link state polling interval to 20 seconds for interface serial 1/0.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] timer hold 20
```

virtualbaudrate

Syntax **virtualbaudrate** *virtualbaudrate*

undo virtualbaudrate

View Synchronous serial interface view

Parameter *virtualbaudrate*: Baud rate (in bps) to be set, which must be consistent with the one configured at the DCE side. It can be 1,200, 2,400, 4,800, 9,600, 19,200, 38,400, 56,000, 57,600, 64,000, 72,000, 115,200, 128,000, 192,000, 256,000, 384,000, 512,000, 768,000, 2,048,000, or 4,096,000.

Description Use the **virtualbaudrate** command to set a virtual baud rate for the DTE interface.

Use the **undo virtualbaudrate** command to remove the specified virtual baud rate.

When working as DTE, the serial interface determines its baud rate through negotiation with the DCE side. The **virtualbaudrate** command, however, allows you to configure DTE-side baudrate manually, but the configured value must be the same as the one set at the DCE side.

After executing the **virtualbaudrate** command, you need to shut down and then bring up the interface (using the **shutdown** command and the **undo shutdown** command) for the new setting to take effect.

- *Configure the **baudrate** command at DCE side and the **virtualbaudrate** command at DTE side (only when the interface is operating in synchronous mode). Avoid configuring the two commands at the same end of a link.*
- *At DCE side, the **display interface** command displays the baud rate of the interface; whereas at the DTE end, the command displays the virtual baud rate of the interface.*

Related command: **baudrate**.

Example # Set the virtual baudrate of DTE interface Serial 1/0 to 19,200 bps.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] virtualbaudrate 19200
```

12 FUNDAMENTAL CE1/PRI INTERFACE CONFIGURATION COMMANDS

cable

Syntax **cable** { **long** | **short** }

undo cable

View CE1/PRI interface view

Parameter **long**: Indicates that the attenuation of receiver is -43 dB.

short: Indicates that the attenuation of receiver is -10 dB.

Description Use the **cable** command to set the cable type for a CE1/PRI interface.

Use the **undo cable** command to restore the default.

By default, the **long** keyword applies.

Example # Set the cable length matching CE1/PRI interface E1 2/0 to **short**.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] cable short
```

channel-set (CE1/PRI interface view)

Syntax **channel-set** *set-number* **timeslot-list** *list*

undo channel-set [*set-number*]

View CE1/PRI interface view

Parameter *set-number*: The number of the channel set formed by bundling timeslots on the interface, in the range 0 to 30.

timeslot-list *list*: Specifies timeslots to be bundled. The *list* argument is timeslot numbers, in the range of 1 to 31. You may specify a single timeslot by specifying a number, a range of timeslots by specifying a range in the form of *number1*-*number2*, or several discrete timeslots by specifying *number1*, *number2*-*number3*.

Description Use the **channel-set** command to bundle timeslots on the CE1/PRI interface into a channel-set.

Use the **undo channel-set** command to restore the default.

By default, no timeslots are bundled into channel sets.

A CE1/PRI interface in CE1/PRI mode is physically divided into 32 timeslots numbered 0 through 31.

In actual applications, all the timeslots except timeslot 0 can be bundled into multiple channel sets. For each channel set, the system automatically creates a serial interface which is logically equivalent to a synchronous serial interface.

The serial interface is numbered in the form of **serial** *interface-number***:***set-number*, where, *interface-number* is the number of the CE1/PRI interface, and *set-number* is the number of the channel set.

Only one timeslot bundling mode can be supported on a CE1/PRI interface at a time. In other words, this command cannot be used together with the **pri-set** command.

Example # Bundle timeslots 1, 2, 5, 10 through 15, and 18 on CE1/PRI interface E1 2/0 into channel set 0.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] channel-set 0 timeslot-list 1,2,5,10-15,18
```

Make the same configuration on the CE1/PRI interface on the remote router.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] channel-set 0 timeslot-list 1,2,5,10-15,18
```

clock (CE1/PRI interface view)

Syntax **clock** { **master** | **slave** }

undo clock

View CE1/PRI interface view

Parameter **master**: Adopts the internal clock as the clock source.

slave: Adopts the line clock as the clock source.

Description Use the **clock** command to configure clock source for the CE1/PRI interface.

Use the **undo clock** command to restore the default clock source, that is, line clock.

When the CE1/PRI interface is working as DCE, choose the internal clock (**master**) for it. When it is working as DTE, choose the line clock for it.

Example # Use the internal clock as the clock source on CE1/PRI interface E1 2/0.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] clock master
```

code (CEI/PRI interface view)

Syntax **code** { **ami** | **hdb3** }

undo code

View CE1/PRI interface view

Parameter **ami**: Adopts alternate mark inversion (AMI) line code format.

hdb3: Adopts high density bipolar 3 (HDB3) line code format.

Description Use the **code** command to set the line code format for the CE1/PRI interface.

Use the **undo code** command to restore the default, that is, HDB3.

Keep the line code format of the interface in consistency with that used by the remote device.

Example # Set the line code format of interface E1 2/0 to AMI.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] code ami
```

controller e1

Syntax **controller e1** *number*

View System view

Parameter *number*: CE1/PRI interface number.

Description Use the **controller e1** command to enter CE1/PRI interface view.

Example # Enter E1 2/0 interface view.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0]
```

crc

Syntax **crc** { **16** | **32** | **none** }

undo crc

View Synchronous serial interface view

Parameter **16**: Adopts 16-bit cyclic redundancy check (CRC).

32: Adopts 32-bit CRC.

none: Disables CRC.

Description Use the **crc** command to configure CRC mode for a synchronous serial interface formed on a CE1/PRI interface.

Use the **undo crc** command to restore the default, that is, 16-bit CRC.

Example # Apply 32-bit CRC to a serial interface formed on interface CE1 interface 2/0 in unchannelized mode.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] using e1
[Sysname-E1 2/0] quit
[Sysname] interface serial 2/0:0
[Sysname-Serial2/0:0] crc 32
```

detect-ais

Syntax **detect-ais**

undo detect-ais

View CE1 interface view, PRI interface view

Parameter None

Description Use the **detect-ais** command to enable AIS (alarm indication signal) test on an interface.

Use the **undo detect-ais** command to disable AIS test.

By default, AIS test is performed.

Example # Enable AIS test on E1 2/0 interface.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] detect-ais
```

display controller e1

Syntax **display controller e1** [*interface-number*]

View Any view

Parameter *interface-number*: Interface number. In conjunction with the **e1** keyword, it specifies a CE1/PRI interface.

Description Use the **display controller e1** command to display information about one or all the CE1/PRI interfaces.

The displayed information includes:

- Physical state of interface
- Clock mode (source) of interface
- Frame check mode of interface
- Line code format of interface

Example # Display information about interface E1 2/0.

```
<Sysname> display controller e1 2/0
E1 2/0 current state: UP
Description : E1 2/0 Interface
Basic Configuration:
  Work mode is E1 framed, Cable type is 75 Ohm unbalanced.
  Frame-format is no-crc4.
  Line code is hdb3, Source clock is slave.
  Idle code is 7e, Itf type is 7e, Itf number is 4.
  Loop back is not set.
Alarm State:
  Receiver alarm state is None.
Historical Statistics:
Last clearing of counters: Never
    Data in current interval (150 seconds elapsed):
    0 Loss Frame Alignment Secs, 0 Framing Error Secs,
    0 CRC Error Secs, 0 Alarm Indication Secs, 0 Loss-of-signals Secs,
    0 Code Violations Secs, 0 Slip Secs, 0 E-Bit error Secs.
```

Table 17 Description on the fields of the command

Field	Description
E1 2/0 current state: UP	State of the interface
Description : E1 2/0 Interface	Description of the interface
Work mode	Work mode of the interface, which can be E1 or CE1.
Cable type	Cable type of the interface
Frame-format	Frame format of the interface, which can be CRC4 or non-CRC4.
Source Clock	Work mode of the source clock of the interface, which can be master or slave.

Table 17 Description on the fields of the command

Field	Description
Line Code	Line code, which can be AMI or HDB3.
Idle Code	Idle code, which can be 0x7E or 0xFF.
Itf type	Iterframe filling tag, which can be 0x7E or 0xFF.
Itf number	Number of interframe filling tags between two successive frames.
Loopback	Loopback state
Alarm State	Alarm state
Historical Statistics	Statistics on the interface
Last clearing of counters	Indicates whether or not the counters are cleared periodically
Data in current interval (150 seconds elapsed):	Statistics on the errors during the current interval
0 Loss Frame Alignment Secs, 0 Framing Error Secs,	
0 CRC Error Secs, 0 Alarm Indication Secs, 0 Loss-of-signals Secs,	
0 Code Violations Secs, 0 Slip Secs, 0 E-Bit error Secs	

error-diffusion restraint config

Syntax **error-diffusion restraint config** *detect-timer renew-timer threshold*

undo error-diffusion restraint config

View System view

Parameter *detect-timer*: Setting of the error packet detect timer, in the range 30 to 600 (in seconds).

renew-timer: Setting of the renew timer, in the range 120 to 2400 (in seconds).

threshold: Error packet ratio threshold, in the range 5 to 100 (in percentage).

Description Use the **error-diffusion restraint config** command to set the three parameters in error packet diffusion restraint.

Use the **undo error-diffusion restraint enable** command to restore the default settings of the three parameters.

By default, the error packet detect timer is set to 30 seconds, the renew timer is set to 600 seconds, and the error packet ratio threshold is 20.

The setting of renew timer must be at least four times that of the error packet detect timer. If the total number of the packets received during *detect-timer* is less than 100, error packets are not counted.

- *The support for these two commands varies with device models.*
- *These two commands apply to CT1/PRI interfaces and CE1/PRI interfaces only.*

Example # Set the error packet detect timer to 100 seconds, the renew timer to 2400 seconds, and the error packet ratio threshold to 15.

```
<Sysname> system-view
[Sysname] error-diffusion restraint config 100 2400 15
```

error-diffusion restraint enable

Syntax **error-diffusion restraint enable**

undo error-diffusion restraint enable

View System view

Parameter None

Description Use the **error-diffusion restraint enable** command to enable error packets diffusion restraint.

Use the **undo error-diffusion restraint enable** command to disable this function.

By default, error packets diffusion restraint is enabled.

- *The support of these two commands varies with device model.*
- *These two commands apply to CT1/PRI interfaces and CE1/PRI interfaces only.*

Example # Enable error packets diffusion restraint.

```
<Sysname> system-view
[Sysname] error-diffusion restraint enable
```

error-diffusion restraint restart-channel

Syntax **error-diffusion restraint restart-channel serial** *interface-number*:*set-number*

View System view

Parameter **serial** *interface-number:set-number*: Number of channel formed by bundling CE1/PRI interfaces, where *interface-number* is the number of the CE1/PRI interface, *set-number* is the number of the channel set.

Description Use the **error-diffusion restraint restart-channel** command to restart the channel that has been shut down for the sake of error packets diffusion restraint.

- *The support of this command varies with device model.*
- *This command applies to CT1/PRI interfaces and CE1/PRI interfaces only.*

Example # restart channel serial 2/0:0 that has been shut down due to error packets diffusion.

```
<Sysname> system-view
[Sysname] error-diffusion restraint restart-channel serial 2/0:0
```

frame-format (CE1/PRI interface view)

Syntax **frame-format** { **crc4** | **no-crc4** }

undo frame-format

View CE1/PRI interface view

Parameter **crc4**: Sets framing format to CRC4.

no-crc4: Sets framing format to no-CRC4.

Description Use the **frame-format** command to set the framing format on the CE1 interface.

Use the **undo frame-format** command to restore the default, that is, no-CRC4.

A CE1/PRI interface in CE1 mode supports both CRC4 and no-CRC4 framing formats, where CRC4 supports four-bit CRC on physical frames while no-CRC4 does not.

Example # Set the framing format on interface E1 2/0 to CRC4.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] frame-format crc4
```

idlecode (CE1/PRI interface view)

Syntax **idlecode** { **7e** | **ff** }

undo idlecode

View CE1/PRI interface view

Parameter **7e**: Sets line idle code to 0x7e.

ff: Sets line idle code to 0xff.

Description Use the **idlecode** command to set the line idle code on the CE1/PRI interface. Two types of line idle code are available: 0x7E and 0xFF.

Use the **undo idlecode** command to restore the default, that is, 0x7E.

The line idle code is sent in the timeslots that are not bundled into logical channels.

Example # Set the line idle code to 0x7E on CE1/PRI interface E1 2/0.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] idlecode 7e
```

itf (CE1/PRI interface view)

Syntax **itf** { **number** *number* | **type** { **7e** | **ff** } }

undo itf { **type** | **number** }

View CE1/PRI interface view

Parameter **number** *number*: Sets the number of interframe filling tags, which ranges from 0 to 14.

type { **7e** | **ff** }: Sets the type of interframe filling tag to 0x7E by specifying the **7e** argument or to 0xFF by specifying the **ff** keyword.

Description Use the **itf** command to set the type of and the number of interframe filling tags on the CE1/PRI interface. Two types of interframe filling tag are available: 0x7E and 0xFF.

Use the **undo itf** command to restore the default.

By default, interframe filling tag is 0x7E and the number of interframe filling tags is 4.

Interframe filling tags are sent when no service data is sent on the timeslots bundled into logical channels on the CE1/PRI interface.

Example # Set the type of interframe filling tag to 0xFF on CE1/PRI interface E1 2/0.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] itf type ff
```

Set the number of interframe filling tags to five on CE1/PRI interface E1 2/0.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] itf number 5
```

loopback (CE1/PRI interface view)

Syntax **loopback** { **local** | **payload** | **remote** }

undo loopback

View CE1/PRI interface view

Parameter **local**: Sets the interface in local loopback mode.

remote: Sets the interface in external loopback mode.

payload: Sets the interface in external payload loopback mode.

Description Use the **loopback** command to enable loopback and set the loopback mode.

Use the **undo loopback** command to restore the default.

By default, loopback is disabled.

Loopback is intended for checking the condition of interfaces or cables. Disable it otherwise.

You can bundle timeslots on the CE1/PRI interface to form a serial interface and encapsulate it with PPP. After you enable loopback on this serial interface, it is normal that the state of the link layer protocol is reported down.

Example # Set interface E1 2/0 in internal loopback mode.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] loopback local
```

pri-set (CE1/PRI interface view)

Syntax **pri-set** [**timeslot-list** *list*]

undo pri-set

View CE1/PRI interface view

Parameter **timeslot-list** *list*: Specifies timeslots to be bundled. The *list* argument is timeslot numbers, in the range of 1 to 31. You may specify a single timeslot by specifying a number, a range of timeslots by specifying a range in the form of *number1*-*number2*, or several discrete timeslots by specifying *number1*, *number2*-*number3*.

Description Use the **pri-set** command to bundle timeslots on the CE1/PRI interface into a PRI set.

Use the **undo pri-set** command to remove the bundle.

By default, no PRI set is created.

On a CE1/PRI interface in PRI mode, timeslot 0 is used for frame synchronization control (FSC), timeslot 16 as the D channel for signaling transmission, and other timeslots as B channels for data transmission.

You can create only one PRI set on a CE1/PRI interface. This PRI set can include any timeslots except timeslot 0 and must include timeslot 16. Note that timeslot 16 cannot form a bundle that includes itself only. The attempt to bundle only timeslot 16 will fail.

If no timeslot is specified in this command, all timeslots except timeslot 0 are bundled into an interface in the form of 30B + D.

Upon creation of the PRI set, the system creates a serial interface logically equivalent to an ISDN PRI interface. The serial interface is named in the form of **serial** *number***:15**, where *number* represents the number of the CE1/PRI interface where the serial interface is created.

Because a channel set and a PRI set cannot coexist on a CE1/PRI interface, your PRI set creation attempt will fail if the **channel-set** command is configured.

Example # Bundle timeslots 1, 2, and 8 through 12 into a PRI set on CE1/PRI interface E1 2/0.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] pri-set timeslot-list 1,2,8-12
```

reset counters controller e1

Syntax **reset counters controller e1** *interface-number*

View User view

Parameter *interface-number*: Interface number.

Description Use the **reset counters controller e1** command to clear the controller counter for a CE1/PRI interface.

To display the information of the controller counter, use the **display controller e1** command.

- *The **reset counters interface** command does not clear the controller counters of CE1/PRI interfaces. To do that, use the **reset counters controller e1** command.*
- *The controller counters information that is cleared using the **reset counters controller e1** command is the same information that you can view with the **display controller e1** [interface-number] command.*

Example # Clear the controller counter for CE1/PRI interface E1 2/0.

```
<Sysname> reset counters controller e1 2/0
```

using (CE1/PRI interface view)

Syntax **using** { **ce1** | **e1** }

undo using

View CE1/PRI interface view

Parameter **ce1**: Sets the interface to operate in CE1/PRI mode.

e1: Sets the interface to operate in E1 mode.

Description Use the **using** command to configure the operating mode of the CE1/PRI interface.

Use the **undo using** command to restore the default, that is, CE1/PRI mode.

A CE1/PRI interface can work in either E1 mode (non-channelized mode) or CE1/PRI mode (channelized mode).

In E1 mode, the interface equals a 2 Mbps interface without timeslot division. Its logical features are the same like those of a synchronous serial interface. In CE1/PRI mode, it is physically divided into 32 timeslots numbered 0 through 31, where timeslot 0 is used for FSC. This interface can work as either a CE1 interface or a PRI interface.

After you set the CE1/PRI interface to work in E1 mode, the system automatically creates a serial interface numbered **serial** *interface-number***:0**, where *interface-number* represents the number of the CE1/PRI interface.

Example # Set CE1/PRI interface E1 2/0 to work in E1 mode.

```
<Sysname> system-view
[Sysname] controller e1 2/0
[Sysname-E1 2/0] using e1
```

13 FUNDAMENTAL CT1/PRI INTERFACE CONFIGURATION COMMANDS

alarm-threshold

Syntax **alarm-threshold** { **ais** { **level-1** | **level-2** } | **lfa** { **level-1** | **level-2** | **level-3** | **level-4** } | **los** { **pulse-detection** | **pulse-recovery** } *value* }

undo alarm-threshold

View CT1/PRI interface view

Parameter **ais**: Sets the alarm threshold of alarm indication signal (AIS), which can be **level-1** and **level-2**.

- The **level-1** keyword specifies to generate an AIS alarm when the number of 0s in the bit stream of an SF or ESF frame is less than or equal to 2.
- The **level-2** keyword specifies to generate an AIS alarm when the number of 0s is less than or equal to 3 in the bit stream of an SF frame or less than or equal to 5 in the bit stream of an ESP frame.

By default, level-1 AIS alarm threshold applies.

lfa: Sets the loss of frame align (LFA) alarm threshold, which can be **level-1**, **level-2**, **level-3**, and **level-4**.

- The **level-1** keyword specifies to generate an LFA alarm when two of four frame alignment bits are lost.
- The **level-2** keyword specifies to generate an LFA alarm when two of five frame alignment bits are lost.
- The **level-3** keyword specifies to generate an LFA alarm when two of six frame alignment bits are lost.
- The **level-4** keyword applies only to ESF frames. It specifies to generate an LFA alarm when errors are detected in four consecutive ESF frames.

By default, level-1 LFA alarm threshold applies.

los: Sets a loss of signal (LOS) alarm threshold, which can be **pulse-detection** (for the pulse detection duration threshold with LOS) and **pulse-recovery** (for the pulse threshold with LOS).

The threshold of pulse-detection, in units of pulse intervals, ranges from 16 to 4,096 and defaults to 176.

The threshold of pulse-recovery, ranges from 1 to 256 and defaults to 22.

If the number of the pulses detected during the total length of the specified pulse detection intervals is smaller than the pulse-recovery threshold, a LOS alarm occurs. For example, if the two thresholds take their defaults, a LOS alarm is created if the number of pulses detected within 176 pulse intervals is less than 22.

Description Use the **alarm-threshold** command to set LOS, AIS, or LFA alarm thresholds on the CT1/PRI interface.

Use the **undo alarm-threshold** command to restore the defaults.

Example # Set the number of detection intervals to 300 for the pulse detection duration threshold.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] alarm-threshold los pulse-detection 300
```

bert (CT1/PRI interface view)

Syntax **bert pattern** { **2^15** | **2^20** } **time** *minutes* [**unframed**]

undo bert

View CT1/PRI interface view

Parameter **pattern**: Sets a bit error rate test (BERT) pattern, which could be 2^15 or 2^20.

2^15: Two to the fifteenth power, length of transmitted BERT pattern in bits.

2^20: Two to the twentieth power, length of transmitted BERT pattern in bits.

time *minutes*: Sets the duration (in minutes) of a BERT test. The *minutes* argument ranges from 1 to 1,440.

unframed: Sets the test pattern to cover the overhead bits of the frame.

Description Use the **bert** command to start a BERT test on a CT1/PRI interface.

Use the **undo bert** command to stop the BERT test running on the CT1/PRI interface.

ITU O.151, ITU O.153, and ANSI T1.403-1999 define many BERT patterns, among which, the CT1/PRI interface supports only 2^15 and 2^20 at present.

When running a BERT test, the local end sends out a pattern, which is to be looped over somewhere on the line and back to the local end. The local end then checks the received pattern for bit error rate, and by so doing helps you identify the condition of the line. To this end, you must configure loopback to allow the transmitted pattern to loop back from somewhere on the line, for example, from the far-end interface by placing the interface in a far-end loopback.

You may view the state and result of the BERT test with the **display controller t1** command.

Example # Run a 10-minute 2^20 BERT test on CT1/PRI interface t1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] bert pattern 2^20 time 10
```

cable (CT1/PRI interface view)

Syntax **cable** { **long** { **0db** | **-7.5db** | **-15db** | **-22.5db** } | **short** { **133ft** | **266ft** | **399ft** | **533ft** | **655ft** } }

undo cable

View CT1/PRI interface view

Parameter **long**: Matches 199.6-meter (655-feet) and longer cable length. The options for this parameter include **0db**, **-7.5db**, **-15db** and **-22.5db**. The attenuation parameter is selected depending on the signal quality received at the receiving end. In this case, no external CSU is needed.

short: Matches a cable length shorter than 199.6 meters (655 feet). The options for this parameter include **133ft**, **266ft**, **399ft**, **533ft** and **655ft**. The *length* parameter is selected depending on the actual transmission distance.

Description Use the **cable** command to set the cable attenuation and length on the CT1/PRI interface.

Use the **undo cable** command to restore the default, that is, **long 0db**.

You may use this command to adapt signal waveform to different transmission conditions such as the quality of the signal received by the receiver. If the signal quality is good, you can use the default setting. In this case, the CT1/PRI interface does not need an external CSU device.

Example # Set the cable length to 40.5 meter (133 feet) on CT1/PRI interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] cable short 133ft
```

channel-set (CT1/PRI interface view)

Syntax **channel-set** *set-number* **timeslot-list** *list* [**speed** { **56k** | **64k** }]

undo channel-set [*set-number*]

View CT1/PRI interface view

Parameter *set-number*: The number of the channel set formed by timeslot bundling on the interface. It ranges from 0 to 23.

timeslot-list *list*: Specifies timeslots to be bundled. The *list* argument is timeslot numbers, in the range of 1 to 24. You may specify a single timeslot by specifying a number, a range of timeslots by specifying a range in the form of *number1*-*number2*, or several discrete timeslots by specifying *number1*, *number2*-*number3*.

speed { **56k** | **64k** }: Speed of the timeslot bundle (the channel set) in kbps. If **56k** is selected, the timeslots is bundled into N × 56 kbps bundles. If **64k**, the default, is selected, the timeslots is bundled into N × 64 kbps bundles.

Description Use the **channel-set** command to bundle timeslots on the CT1/PRI interface into a channel set.

Use the **undo channel-set** command to remove a specified or all channel sets.

By default, no timeslots are bundled into channel sets.

A CT1/PRI interface is physically divided into 24 timeslots numbered 1 through 24. In actual applications, all the timeslots can be bundled into multiple channel sets. For each channel set, the system automatically creates a serial interface logically equivalent to a synchronous serial interface.

The serial interface is named in the form of **serial** *interface-number:set-number*, where *interface-number* starts from the maximum serial interface number plus 1, and *set-number* represents the number of the channel set.

Only one timeslot bundling mode is supported on a CT1/PRI interface at a time. In other words, you cannot use this command together with the **pri-set** command.

Example # Bundle timeslots 1, 2, 5, 10 through 15, and 18 into channel set 0 on CT1/PRI interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] channel-set 0 timeslot-list 1,2,5,10-15,18
```

clock (CT1/PRI interface view)

Syntax **clock** { **master** | **slave** }

undo clock

View CT1/PRI interface view

Parameter **master**: Adopts the internal clock as the clock source.

slave: Adopts the line clock as the clock source.

Description Use the **clock** command to configure clock source for the CT1/PRI interface.

Use the **undo clock** command to restore the default clock source, that is, line clock.

When the CT1/PRI interface is working as DCE, choose the internal clock for it. When it is working as DTE, choose the line clock for it.

Example # Use the internal clock as the clock source on CT1/PRI interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] clock master
```

code (CT1/PRI interface view)

Syntax **code** { **ami** | **b8zs** }

undo code

View CT1/PRI interface view

Parameter **ami**: Adopts AMI line code format.

b8zs: Adopts bipolar with 8-zero substitution (B8ZS) line code format.

Description Use the **code** command to set the line code format for the CT1/PRI interface.

Use the **undo code** command to restore the default, that is, B8ZS.

Keep the line code format of the interface in consistency with the one used on the remote device.

Example # Set the line code format of the interface T1 2/0 to AMI.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] code ami
```

controller t1

Syntax **controller t1** *number*

View System view

Parameter *number*: CT1/PRI interface number.

Description Use the **controller t1** command to enter CT1/PRI interface view.

Example # Enter the view of interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0]
```

crc

Syntax **crc** { **16** | **32** | **none** }

undo crc

View Synchronous serial interface view

Parameter **16**: Adopts 16-bit CRC.

32: Adopts 32-bit CRC.

none: Disables CRC.

Description Use the **crc** command to configure CRC mode for a synchronous serial interface formed on a CE1/PRI interface.

Use the **undo crc** command to restore the default, that is, 16-bit CRC.

Example # Apply 32-bit CRC to a serial interface formed on interface CT1 interface 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] channel-set 1 timeslot-list 2-6
[Sysname-T1 2/0] quit
[Sysname] interface serial 2/0:1
[Sysname-Serial2/0:1] crc 32
```

data-coding (CT1/PRI interface view)

Syntax **data-coding** { **inverted** | **normal** }

undo data-coding

View CT1/PRI interface view

Parameter **inverted**: Enables user data inversion.

normal: Disables user data inversion.

Description Use the **data-coding normal** command to disable user data inversion on the CT1/PRI interface.

Use the **data-coding inverted** command to enable user data inversion on the CT1/PRI interface.

Use the **undo data-coding** command to restore the default.

By default, data inversion is disabled.

To prevent 7e in valid data from being taken for stuffing characters, HDLC inserts a zero after every five ones in the data stream. Then, HDLC inverts every one bit into a zero and every zero bit into a one. This ensures at least one out of every eight bits is a one. When AMI encoding is adopted on a T1 interface, the use of data inversion can eliminate the presence of multiple consecutive zeros.

At the two ends of the line, the same data inversion setting must be adopted.

Example # Enable user data inversion on CT1/PRI interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] data-coding inverted
```

display controller t1

Syntax **display controller t1** [*interface-number*]

View Any view

Parameter *interface-number*: Interface number. In conjunction with the **t1** keyword, it specifies a CT1/PRI interface.

Description Use the **display controller t1** command to display information about one specified or all CT1/PRI interfaces.

This command displays the following information about the specified interface:

- Physical state
- Cable type
- Framing
- Clock source (mode)
- Line code format
- Loopback mode
- Line idle code type
- Interframe filling tag type
- Alarm states
- Error statistics gathered at 15-minute intervals during the last 24 hours

Example # Display information about interface T1 2/0.

```
<Sysname> display controller t1 2/0
T1 2/0 current state :DOWN
Description : T1 2/0 Interface
Basic Configuration:
```

```
  Work mode is T1 framed, Cable type is 100 Ohm balanced.
  Frame-format is esf, fdl is none, Line code is b8zs.
  Source clock is slave, Data-coding is normal.
  Idle code is ff, Itf type is ff, Itf number is 2.
  Loop back is not set.
Alarm State:
  Receiver alarm state is Loss-of-Signal.
  Transmitter is sending remote alarm.
  Pulse density violation detected.
SendLoopCode History:
  inband-llb-up:0 times, inband-llb-down:0 times.
  fdl-ansi-llb-up:0 times, fdl-ansi-llb-down:0 times.
  fdl-ansi-plb-up:0 times, fdl-ansi-plb-down:0 times.
BERT state:(stopped, not completed)
  Test pattern: 2^15, Status: Not Sync, Sync Detected: 0
    Time: 0 minute(s), Time past: 0 minute(s)
    Bit Errors (since test started): 0 bits
    Bits Received (since test started): 0 Kbits
    Bit Errors (since latest sync): 0 bits
    Bits Received (since latest sync): 0 Kbits
Historical Statistics:
Last clearing of counters: Never
  Data in current interval (285 seconds elapsed):
    0 Line Code Violations, 0 Path Code Violations
    0 Ais Alarm Secs, 286 Los Alarm Secs
    7 Slip Secs, 286 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
    0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 286 Unavail Secs
  Data in Interval 1:
    0 Line Code Violations, 0 Path Code Violations
    0 Ais Alarm Secs, 901 Los Alarm Secs
    22 Slip Secs, 901 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
    0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 901 Unavail Secs
  Data in Interval 2:
    0 Line Code Violations, 0 Path Code Violations
    0 Ais Alarm Secs, 900 Los Alarm Secs
    23 Slip Secs, 900 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
    0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 900 Unavail Secs
  Total Data (last 2 15 minute intervals):
    0 Line Code Violations, 0 Path Code Violations
    0 Ais Alarm Secs, 2087 Los Alarm Secs
    52 Slip Secs, 2087 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
    0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 2087 Unavail Secs
```

Table 18 Description on the fields of the display controller t1 command

Field	Description
T1 2/0/0 current state	Physical state of the interface: up or down
Description	Description about the T1 interface
Basic Configuration	Basic configurations of the interface
Work mode	Operating mode of the T1 interface, T1 framed in this example
Cable type	Cable type of the T1 interface, 100 ohm balanced in this example
Frame-format	Frame format configured on the T1 interface: ESF or SF
fdl	FDL format: ANSI, ATT, or none
Line code	Line code: AMI or B8ZS
Source clock	Source clock used by the interface: master for the internal clock or slave for the line clock
Data-coding	Normal or inverted
Idle code	0x7E or 0xFF
Itf type	Type of interframe filling tag: 0x7E or 0xFF

Table 18 Description on the fields of the display controller t1 command

Field	Description
Itf number	Number of interframe filling tags
Loop back	Loopback setting on the interface: local, payload, remote, or not set
Alarm State	Alarm state
Receiver alarm state	Type of received alarm: none, LOS, LOF, RAI, or AIS
Transmitter is sending remote alarm.	Type of transmitted alarm: RAI, or none
Pulse density violation detected	The detected pulse density is incompliant with the specification
SendLoopCode History: inband-llb-up:0 times, inband-llb-down:0 times. fdl-ansi-llb-up:0 times, fdl-ansi-llb-down:0 times. fdl-ansi-plb-up:0 times, fdl-ansi-plb-down:0 times	History of loopback code sending to the far-end, including the number of transmissions for each type of code, and the type of the last sent code. (See "sendloopcode" on page 229.)
BERT state:(stopped, not completed)	BERT state: completed, stopped (not completed), or running.
Test pattern: 2^15, Status: Not Sync, Sync Detected: 0	Test pattern in use (2^20 or 2^15), 2^15 in this example; synchronization state, and the number of detected synchronizations
Time: 0 minute(s), Time past: 0 minute(s)	The duration of the BERT test and the time that has elapsed
Bit Errors (since test started)	Number of bit errors received since the start of the BERT test
Bits Received (since test started)	Number of bits received since the start of the BERT test
Bit Errors (since latest sync)	Number of bit errors received since the last synchronization
Bits Received (since latest sync)	Number of bits received since last synchronization
Historical Statistics:	Historical statistics
Last clearing of counters	Counter clearing records
Data in current interval (285 seconds elapsed): 0 Line Code Violations, 0 Path Code Violations 0 Ais Alarm Secs, 286 Los Alarm Secs 7 Slip Secs, 286 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins 0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 286 Unavail Secs	Statistics spanning the current interval. The statistical items, such as AIS alarm, LOS signal, and LFA, are provided according to the T1 specifications for the physical layer. For details, refer to ANSI T1.403 and AT&T TR 54016.

Table 18 Description on the fields of the display controller t1 command

Field	Description
Data in Interval 1:	Statistics spanning the first interval.
0 Line Code Violations, 0 Path Code Violations	The statistical items are the same as those provided by the statistics spanning the current interval.
0 Ais Alarm Secs, 901 Los Alarm Secs	
22 Slip Secs, 901 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins	
0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 901 Unavail Secs	
Data in Interval 2:	Statistics spanning the second interval.
0 Line Code Violations, 0 Path Code Violations	The statistical items are the same as those provided by the statistics spanning the current interval.
0 Ais Alarm Secs, 900 Los Alarm Secs	
23 Slip Secs, 900 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins	
0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 900 Unavail Secs	
Total Data (last 2 15 minute intervals):	Statistics spanning the last two intervals.
0 Line Code Violations, 0 Path Code Violations	The statistical items are the same as those provided by the statistics spanning the current interval.
0 Ais Alarm Secs, 2087 Los Alarm Secs	
52 Slip Secs, 2087 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins	
0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 2087 Unavail Secs	

error-diffusion restraint config

Syntax **error-diffusion restraint config** *detect-timer renew-timer threshold*

undo error-diffusion restraint config

View System view

Parameter *detect-timer*: Setting of the error packet detect timer, in the range 30 to 600 (in seconds).

renew-timer: Setting of the renew timer, in the range 120 to 2400 (in seconds).

threshold: Error packet ratio threshold, in the range 5 to 100 (in percentage).

Description Use the **error-diffusion restraint config** command to set the three parameters in error packet diffusion restraint.

Use the **undo error-diffusion restraint enable** command to restore the default settings of the three parameters.

By default, the error packet detect timer is set to 30 seconds, the renew timer is set to 600 seconds, and the error packet ratio threshold is 20.

The setting of renew timer must be at least four times that of the error packet detect timer. If the total number of the packets received during *detect-timer* is less than 100, error packets are not counted.

- *The support for these two commands varies with device models.*
- *These two commands apply to CT1/PRI interfaces and CE1/PRI interfaces only.*

Example # Set the error packet detect timer to 100 seconds, the renew timer to 2400 seconds, and the error packet ratio threshold to 15.

```
<Sysname> system-view
[Sysname] error-diffusion restraint config 100 2400 15
```

error-diffusion restraint enable

Syntax **error-diffusion restraint enable**

undo error-diffusion restraint enable

View System view

Parameter None

Description Use the **error-diffusion restraint enable** command to enable error packet diffusion restraint.

Use the **undo error-diffusion restraint enable** command to disable error packet diffusion restraint.

By default, the function is disabled.

- *The support of these two commands varies with device model.*
- *These two commands apply to CT1/PRI interfaces and CE1/PRI interfaces only.*

Example # Enable error packet diffusion restraint.

```
<Sysname> system-view
[Sysname] error-diffusion restraint enable
```

error-diffusion restraint restart-channel

Syntax **error-diffusion restraint restart-channel serial** *interface-number*:*set-number*

View System view

Parameter **serial** *interface-number:set-number*: Specifies a channel formed on a CE1/PRI interface. The *interface-number* argument is a CE1/PRI interface number, and the *set-number* argument is a channel set number.

Description Use the **error-diffusion restraint restart-channel** command to bring up a channel previously shut down by the error packet diffusion restraint function.

- *The support of this command varies with device model.*
- *This command applies to CT1/PRI interfaces and CE1/PRI interfaces only.*

Example # Bring up channel Serial 2/0:0 (assuming that the channel is shut down by the error packet diffusion restraint function).

```
<Sysname> system-view
[Sysname] error-diffusion restraint restart-channel serial 2/0:0
```

fdl

Syntax **fdl** { **ansi** | **att** | **none** }

undo fdl

View CT1/PRI interface view

Parameter **ansi**: Implements ANSI T1.403 FDL.

att: Implements AT&T TR 54016 FDL.

none: Disables facilities data link (FDL).

Description Use the **fdl** command to set the behavior of the CT1/PRI interface on the FDL in ESF framing.

Use the **undo fdl** command to restore the default.

By default, FDL is disabled (none).

FDL is an embedded 4 kbps overhead channel within the ESF format for transmitting performance statistics or loopback code.

Example # Implement AT&T TR 54016 FDL on interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] fdl att
```

frame-format (CT1/PRI interface view)

Syntax **frame-format** { **esf** | **sf** }

undo frame-format

View CT1/PRI interface view

Parameter **sf**: Sets the framing format to super frame (SF).

esf: Sets the framing format to extended super frame (ESF).

Description Use the **frame-format** command to set the framing format on the CT1/PRI interface.

Use the **undo frame-format** command to restore the default, that is, **esf**.

CT1/PRI interfaces support two framing formats, that is, SF and ESF. In SF format, multiple frames can share the same FSC and signaling information, so that more significant bits are available for transmitting user data. The use of ESF allows you to test the system without affecting the ongoing service.

Example # Set the framing format of interface T1 2/0 to SF.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] frame-format sf
```

idlecode (CT1/PRI interface view)

Syntax **idlecode** { **7e** | **ff** }

undo idlecode

View CT1/PRI interface view

Parameter **7e**: Sets the line idle code to 0x7E.

ff: Sets the line idle code to 0xFF.

Description Use the **idlecode** command to set the line idle code on the CT1/PRI interface. Two types of line idle code are available: 0x7E and 0xFF.

Use the **undo idlecode** command to restore the default, that is, 0x7E.

The line idle code is sent in the timeslots that are not bundled into the logical channels on the interface.

Example # Set the line idle code to 0x7E on CT1/PRI interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] idlecode 7e
```

itf (CT1/PRI interface view)

Syntax **itf** { **number** *number* | **type** { **7e** | **ff** } }

undo itf { **number** | **type** }

View CT1/PRI interface view

Parameter **number** *number*: Sets the number of interframe filling tags (an interframe filling tag is one byte in length). The *number* argument ranges from 0 to 14.

type { **7e** | **ff** }: Sets the interframe filling tag to 0x7E by specifying the **7e** keyword or to 0xFF by specifying the **ff** keyword. On CT1/PRI interfaces, the default interframe filling tag is 0x7E.

Description Use the **itf** command to set the type and the number of interframe filling tags on the CT1/PRI interface. Two types of interframe filling tag are available: 0x7E and 0xFF.

Use the **undo itf** command to restore the default.

By default, the interframe filling tag is 0x7E, the number of interframe filling tags is 4.

Interframe filling tags are sent when no service data is sent on the timeslots bundled into logical channels on a CT1/PRI interface.

Example # Set the interframe filling tag to 0xFF on CT1/PRI interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] itf type ff
```

Set the number of interframe filling tags to five on CT1/PRI interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] itf number 5
```

loopback (CT1/PRI interface view)

Syntax **loopback** { **local** | **payload** | **remote** }

undo loopback

View CT1/PRI interface view

Parameter **local**: Enables the CT1/PRI interface to perform local loopback.

payload: Enables the interface to perform external payload loopback.

remote: Enables the interface to perform remote loopback.

Description Use the **loopback** command to enable local, remote, or external payload loopback on the CT1/PRI interface.

Use the **undo loopback** command to restore the default.

By default, loopback is disabled.

Loopback is intended for checking the condition of interfaces or cables. Disable it otherwise.

You can bundle timeslots on a CT1/PRI interface to form a serial interface and encapsulate it with PPP. After you enable loopback on this serial interface, it is normal that the state of the link layer protocol is reported down.

Example # Enabled remote loopback on interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] loopback remote
```

pri-set (CT1/PRI interface view)

Syntax **pri-set** [**timeslot-list** *list*]

undo pri-set

View CT1/PRI interface view

Parameter *list*: Specifies timeslots to be bundled. Timeslots are numbered 1 through 24. You may specify a single timeslot by specifying a number, a range of timeslots by specifying a range in the form of *number1***-***number2*, or several discrete timeslots by specifying *number1*, *number2***-***number3*.

Description Use the **pri-set** command to bundle timeslots into a PRI set on the CT1/PRI interface.

Use the **undo pri-set** command to remove the timeslot bundle.

By default, no PRI set is created.

When creating a PRI set on a CT1/PRI interface, note that timeslot 24 is the D channel for transmitting signaling; it cannot form a bundle that includes itself only. The attempts to bundle only timeslot 24 will fail.

In the created PRI set, timeslot 24 is used as D channel for signaling transmission, and the other timeslots as B channels for data transmission. You may randomly bundle these timeslots into a PRI set (as the D channel, timeslot 24 is automatically bundled). If no timeslot is specified, all timeslots are bundled into an interface similar to an ISDN PRI interface in the form of 23B+D.

For the PRI set, the system automatically creates a serial interface logically equivalent to an ISDN PRI interface. The serial interface is named in the form of **serial** *number***:23**, where *number* is the number of the CT1/PRI interface on which the serial interface is created.

Because a channel set and a PRI set cannot coexist on a CT1/PRI interface, your PRI set creation attempt will fail if the **channel-set** command is configured.

Example # Bundle timeslots 1, 2, and 8 through 12 into a PRI set on CT1/PRI interface T1 2/0.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] pri-set timeslot-list 1,2,8-12
```

reset counters controller t1

Syntax **reset counters controller t1** *interface-number*

View User view

Parameter *interface-number*: Interface number.

Description Use the **reset counters controller t1** command to clear the controller counter for a CT1/PRI interface.

To display the value of the controller counter, use the **display controller t1** command.

*The **reset counters interface** command cannot clear the controller counters for CT1/PRI interfaces. To do so, you must use the **reset counters controller t1** command.*

Example # Clear the controller counter for CT1/PRI interface T1 2/0.

```
<Sysname> reset counters controller t1 2/0
```

sendloopcode

Syntax **sendloopcode** { **fdl-ansi-llb-down** | **fdl-ansi-llb-up** | **fdl-ansi-plb-down** | **fdl-ansi-plb-up** | **fdl-att-plb-down** | **fdl-att-plb-up** | **inband-llb-down** | **inband-llb-up** }

View CT1/PRI interface view

Parameter **fdl-ansi-llb-down**: Sends ANSI-compliant LLB deactivation request code in the FDL to remove loopback.

fdl-ansi-llb-up: Sends ANSI-compliant line loopback (LLB) activation request code in the FDL to start remote loopback.

fdl-ansi-plb-down: Sends ANSI-compliant PLB deactivation request code in the FDL to remove loopback.

fdl-ansi-plb-up: Sends ANSI-compliant payload loopback (PLB) activation request code in the FDL to start remote loopback.

fdl-att-plb-down: Sends AT&T-complaint PLB deactivation request code in the FDL to remove loopback.

fdl-att-plb-up: Sends AT&T-complaint PLB activation request code in the FDL to start remote loopback.

inband-llb-down: Sends in-band LLB deactivation request code compliant with the ANSI or AT&T implementation to remove loopback.

inband-llb-up: Sends in-band line loopback (LLB) activation request code compliant with the ANSI and AT&T implementation to start remote loopback.

Description Use the **sendloopcode** command to send remote loopback control code.

By default, no remote loopback control code is sent.

You may configure loopback on the far-end CT1/PRI interface by sending loopback request code.

In LLB mode, all 193 bits (one synchronization bit and 192 effective bandwidth bits) in a T1 PCM frame are looped back. In PLB mode, however, only 192 effective bandwidth bits are looped back.

The format of loopback code can be compliant with ANSI T1.403 or AT&T TR 54016.

In SF framing, LLB code is sent using the effective bandwidth. In ESF framing, both LLB code and PLB code are sent/received in the FDL.

Use this command in conjunction with the far-end T1 device. The far-end device must be able to set loopback mode depending on the detected loopback code.

The sending of remote loopback control code lasts five minutes without affecting the operation of other interfaces.

Example # Send in-band LLB activation request code.

```
<Sysname> system-view
[Sysname] controller t1 2/0
[Sysname-T1 2/0] sendloopcode inband-llb-up
```

14 E1-F INTERFACE CONFIGURATION COMMANDS

crc

Syntax **crc** { **16** | **32** | **none** }

undo crc

View Synchronous serial interface view

Parameter **16**: Adopts 16-bit CRC.

32: Adopts 32-bit CRC.

none: Disables CRC.

Description Use the **crc** command to configure CRC mode for an E1-F interface.

Use the **undo crc** command to restore the default, that is, 16-bit CRC.

Example # Adopt 32-bit CRC on E1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] crc 32
```

display fe1

Syntax **display fe1** [**serial** *interface-number*]

View Any view

Parameter **serial** *interface-number*: Specifies a serial interface. If no interface is specified, information on all the E1-F interfaces is displayed.

Description Use the **display fe1 serial** command to display the configuration and state information about the specified or all E1-F interfaces.

If the specified interface is a common serial interface rather than an E1-F interface, the system will display the prompt.

Example # Display the information about an E1-F interface.

```
<Sysname> display fe1 serial 2/0
 Serial2/0
 Basic Configuration:
    E1 FRAMED
Physical type is  FE1 - 75 OHM unbalanced
    Frame-format is  NONE,Line Code is HDB3,Source Clock is SLAVE
  Alarm State:
    Receiver alarm state is None.
Historical Statistics:
Last clearing of counters: Never
    Data in current interval (19349 seconds elapsed):
    129 Loss Frame Alignment Secs, 0 Framing Error Secs,
    0 CRC Error Secs, 0 Alarm Indication Secs, 129 Loss-of-signals Secs,
    0 Code Violations Secs, 0 Slip Secs, 0 E-Bit error Secs.
```

Table 19 Description on the fields of the display fe1 serial command

Field	Description
E1 FRAMED	Operating mode, framed or unframed. In this sample output, it is framed
Physical type	Interface type (75-ohm unbalanced/120-ohm balanced)
Frame-format	Framing format (CRC4/no-CRC4)
Line Code	Line code format: AMI or HDB3.
Source Clock	Source clock: master for internal clock and slave for line clock
Alarm State	Alarm information

fe1 cable

Syntax **fe1 cable** { **long** | **short** }

undo fe1 cable

View E1-F interface view

Parameter **long**: Supports long-haul cables.

short: Supports short-haul cables.

Description Use the **cable** command to set the cable length for an E1-F interface.

Use the **undo cable** command to restore the default.

By default, the **long** keyword applies.

Example # Set the cable length type on E1-F interface Serial 2/0 to short.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 cable short
```

fe1 clock

Syntax **fe1 clock** { **master** | **slave** }

undo fe1 clock

View E1-F interface view

Parameter **master**: Adopts the internal clock as the clock source.

slave: Adopts the line clock as the clock source.

Description Use the **fe1 clock** command to configure clock source for the E1-F interface.

Use the **undo fe1 clock** command to restore the default, that is, line clock.

When the E1-F interface is working as DCE, choose the internal clock (**master**) for it. When it is working as DTE, choose the line clock for it.

Example # Use the internal clock as the clock source on E1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 clock master
```

fe1 code

Syntax **fe1 code** { **ami** | **hdb3** }

undo fe1 code

View E1-F interface view

Parameter **ami**: Adopts AMI line code format.

hdb3: Adopts HDB3 line code format.

Description Use the **fe1 code** command to set the line code format for the E1-F interface.

Use the **undo fe1 code** command to restore the default, that is, HDB3.

Keep the line code format of the interface in consistency with that used by the remote device.

Example # Set the line code format of interface Serial 2/0 to AMI.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 code ami
```

fe1 detect-ais

Syntax **fe1 detect-ais**

undo fe1 detect-ais

View E1-F interface view

Parameter None

Description Use the **fe1 detect-ais** command to enable AIS test on an interface.

Use the **undo fe1 detect-ais** command to disable AIS test.

By default, AIS test is performed.

Example # Enable AIS test on E1-F 2/0 interface.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 detect-ais
```

fe1 frame-format

Syntax **fe1 frame-format** { **crc4** | **no-crc4** }

undo fe1 frame-format

View E1-F interface view

Parameter **crc4**: Sets framing format to CRC4.

no-crc4: Sets framing format to no-CRC4.

Description Use the **fe1 frame-format** command to configure the framing format of the E1-F interface.

Use the **undo fe1 frame-format** command to restore the default, that is, no-CRC4.

An E1-F interface in framed mode supports both CRC4 and no-CRC4 framing formats, where CRC4 supports four-bit CRC on physical frames while no-CRC4 does not.

Example # Set the framing format of E1-F interface Serial 2/0 to CRC4.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 frame-format crc4
```

fe1 loopback

Syntax **fe1 loopback** { **local** | **payload** | **remote** }

undo fe1 loopback

View E1-F interface view

Parameter **local**: Sets the interface in internal loopback mode.

payload: Sets the interface in external payload loopback mode.

remote: Sets the interface in external loopback mode.

Description Use the **fe1 loopback** command to set the E1-F interface in a loopback mode.

Use the **undo fe1 loopback** command to restore the default.

By default, loopback is disabled.

Loopback is intended for checking the condition of interfaces or cables. Disable it otherwise.

The three loopback modes cannot be used at the same time on an E1-F interface.

Example # Set interface Serial 2/0 in internal loopback mode.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 loopback local
```

fe1 timeslot-list

Syntax **fe1 timeslot-list** *list*

undo fe1 timeslot-list

View E1-F interface view

Parameter *list*: Specifies timeslots to be bundled. They are numbered 1 through 31. You may specify a single timeslot by specifying its number, a range of timeslots by specifying a range in the form of *number1*-*number2*, or several discrete timeslots by specifying *number1*, *number2*-*number3*.

Description Use the **fe1 timeslot-list** command to bundle timeslots on the E1-F interface.

Use the **undo fe1 timeslot-list** command to restore the default.

By default, all the timeslots on the E1-F interface are bundled to form a 1984 kbps interface.

Timeslot bundling results in interface rate change. For example, after you bundle timeslots 1 through 10 on the interface, the interface rate becomes 10 × 64 kbps.

Only one channel set can be created on an E1-F interface, and this channel set is associated with the current synchronous serial interface. On a CE1/PRI interface, however, you may create multiple channel sets; for each of them, the system automatically creates a synchronous serial interface.

Timeslot 0 on E1-F interfaces is used for synchronization. Therefore, a bundling operation only involves timeslots 1 through 31.

When the E1-F interface is working in unframed mode, the **fe1 timeslot-list** command is invalid.

Related command: **fe1 unframed**.

Example # Bundle timeslots 1, 2, 5, 10 through 15, and 18 on E1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0]fe1 timeslot-list 1,2,5,10-15,18
```

fe1 idlecode

Syntax **fe1 idlecode** { **7e** | **ff** }

undo fe1 idlecode

View E1-F interface view

Parameter **7e**: Sets the line idle code to 0x7E.

ff: Sets the line idle code to 0xFF.

Description Use the **fe1 idlecode** command to set the line idle code on the E1-F interface. Two types of line idle code are available: 0x7E and 0xFF.

Use the **undo fe1 idlecode** command to restore the default, that is, 0x7E.

The line idle code is sent in the timeslots that are not bundled into the logical channels on the interface.

Example # Set the line idle code to 0x7E on E1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 idlecode 7e
```

fe1 itf

Syntax **fe1 itf** { **number** *number* | **type** { **7e** | **ff** } }

undo fe1 itf { **number** | **type** }

View E1-F interface view

Parameter **number** *number*: Sets the number of interframe filling tags (an interframe filling tag is one byte in length). The *number* argument ranges from 0 to 14.

type { **7e** | **ff** }: Sets the type of interframe filling tag to 0x7E by specifying the **7e** keyword or to 0xFF by specifying the **ff** keyword. The default is 0x7E.

Description Use the **fe1 itf** command to set the type of and the number of interframe filling tags on the E1-F interface. Two types of interframe filling tag are available: 0x7E and 0xFF.

Use the **undo itf** command to restore the default.

By default, the interframe filling tag is 0x7E and the number of interframe filling tags is 4.

Interframe filling tags are sent when no service data is sent on the timeslots bundled into the logical channel on the E1-F interface.

Example # Set the type of interframe filling tag to 0xFF on E1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 itf type ff
```

Set the number of interframe filling tags to five on E1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 itf number 5
```

fe1 unframed

Syntax **fe1 unframed**

undo fe1 unframed

View E1-F interface view

Parameter None

Description Use the **fe1 unframed** command to configure the E1-F interface to work in unframed mode.

Use the **undo fe1 unframed** command to configure the E1-F interface to work in framed mode.

By default, the E1-F interface works in framed mode.

When the E1-F interface is working in unframed mode, it is a 2048 kbps interface without timeslot division and is logically equivalent to a synchronous serial interface.

When it works in framed mode, it is physically divided into 32 timeslots numbered 0 through 31, where timeslot 0 is used for synchronization.

Related command: **fe1 timeslot-list**.

Example # Set E1-F interface Serial 2/0 to work in unframed mode.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fe1 unframed
```

15 T1-F INTERFACE CONFIGURATION COMMANDS

crc

Syntax **crc** { **16** | **32** | **none** }

undo crc

View Synchronous serial interface view

Parameter **16**: Adopts 16-bit CRC.

32: Adopts 32-bit CRC.

none: Disables CRC.

Description Use the **crc** command to configure CRC mode for an T1-F interface.

Use the **undo crc** command to restore the default, that is, 16-bit CRC.

Example # Adopt 32-bit CRC on T1-F interface Serial 1/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] crc 32
```

display ft1

Syntax **display ft1** [**serial** *interface-number*]

View Any view

Parameter **serial** *interface-number*: Specifies a serial interface. If no interface is specified, the information on all the T1-F interfaces is displayed.

Description Use the **display ft1 serial** command to display the configuration and state information about a T1-F interface.

If the specified interface is a common serial interface rather than a T1-F interface, the system will display the prompt.

Example # Display information about T1-F interface Serial 2/0.

```
<Sysname> display ft1 serial 2/0
Serial2/0
Input: 0 packets, 0 bytes
           0 broadcasts, 0 multicasts
           0 errors, 0 runts, 0 giants
           0 CRC, 0 align errors, 0 overruns
           0 dribbles, 0 aborts, 0 no buffers
           0 frame errors
    Output:0 packets, 0 bytes
           0 errors, 0 underruns, 0 collisions
           0 deferred
Basic Configuration:
  Work mode is T1 framed, Cable type is 100 Ohm balanced.
  Frame-format is esf, fdl is none, Line code is b8zs.
  Source clock is slave, Data-coding is normal.
  Idle code is ff, Itf type is ff, Itf number is 2
  Loop back is not set.
Alarm State:
  Receiver alarm state is Loss-of-Signal.
  Transmitter is sending remote alarm.
  Pulse density violation detected.
SendLoopCode History:
  inband-llb-up:0 times, inband-llb-down:0 times.
  fdl-ansi-llb-up:0 times, fdl-ansi-llb-down:0 times.
  fdl-ansi-plb-up:0 times, fdl-ansi-plb-down:0 times.
BERT state:(stopped, not completed)
  Test pattern: 2^15, Status: Not Sync, Sync Detected: 0
    Time: 0 minute(s), Time past: 0 minute(s)
    Bit Errors (since test started): 0 bits
    Bits Received (since test started): 0 Kbits
    Bit Errors (since latest sync): 0 bits
    Bits Received (since latest sync): 0 Kbits
Historical Statistics:
Last clearing of counters: Never
  Data in current interval (285 seconds elapsed):
    0 Line Code Violations, 0 Path Code Violations
    0 Ais Alarm Secs, 286 Los Alarm Secs
    7 Slip Secs, 286 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
    0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 286 Unavail Secs
  Data in Interval 1:
    0 Line Code Violations, 0 Path Code Violations
    0 Ais Alarm Secs, 901 Los Alarm Secs
    22 Slip Secs, 901 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
    0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 901 Unavail Secs
  Data in Interval 2:
    0 Line Code Violations, 0 Path Code Violations
    0 Ais Alarm Secs, 900 Los Alarm Secs
    23 Slip Secs, 900 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
    0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 900 Unavail Secs
  Total Data (last 2 15 minute intervals):
    0 Line Code Violations, 0 Path Code Violations
    0 Ais Alarm Secs, 2087 Los Alarm Secs
    52 Slip Secs, 2087 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
    0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 2087 Unavail Secs
```

Table 20 Description on the fields of the display ft1 serial command

Field	Description
Serial2/0	Interface type and number
Basic Configuration	Basic configurations for the interface
Input	Statistics about the input and output
Output	
Work mode	T1 interface operating mode, T1 framed in this sample output

Table 20 Description on the fields of the display ft1 serial command

Field	Description
Cable type	Cable type of the interface, 100 ohm balanced in this sample output
Frame-format	Frame format configured on the interface: ESF or SF
fdl	FDL format: ANSI, ATT, or none
Line code	AMI or B8ZS
Source Clock	Source clock used by the interface: master for the internal clock or slave for the line clock
Data-coding	Normal or inverted
Idle code	7e or ff
Itf type	Type of interframe filling tag: 7e or ff
Itf number	Number of interframe filling tags
Loop back	Loopback setting on the interface: local, payload, remote, or not set
Alarm State	Alarm state
Receiver alarm state	Type of received alarm: none, LOS, LOF, RAI, or AIS
Transmitter is sending remote alarm.	Type of transmitted alarm: RAI, or none
Pulse density violation detected	The detected pulse density is incompliant with the specification
SendLoopCode History: inband-llb-up:0 times, inband-llb-down:0 times. fdl-ansi-llb-up:0 times, fdl-ansi-llb-down:0 times. fdl-ansi-plb-up:0 times, fdl-ansi-plb-down:0 times	History of loopback code sending to the far-end, including the number of transmissions for each type of code, and the type of the last sent code. (See "ft1 sendloopcode" on page 251.)
BERT state:(stopped, not completed)	BERT state: completed, stopped (administratively stopped), or running.
Test pattern: 2^15, Status: Not Sync, Sync Detected: 0	Test pattern in use, 2^15 in this sample output; synchronization state, and the number of detected synchronizations
Time: 0 minute(s), Time past: 0 minute(s)	The duration of the BERT test and the time that has elapsed
Bit Errors (since test started)	Number of bit errors received since the start of the BERT test
Bits Received (since test started)	Number of bits received since the start of the BERT test
Bit Errors (since latest sync)	Number of bit errors received since the last synchronization
Bits Received (since latest sync)	Number of bits received since last synchronization
Historical Statistics:	Historical statistics
Last clearing of counters: Never	Counter clearing records

Table 20 Description on the fields of the display ft1 serial command

Field	Description
Data in current interval (285 seconds elapsed): 0 Line Code Violations, 0 Path Code Violations 0 Ais Alarm Secs, 286 Los Alarm Secs 7 Slip Secs, 286 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins 0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 286 Unavail Secs	Statistics spanning the current interval. The statistical items, such as AIS alarm, LOS signal, and LFA, are provided according to the T1 specifications for the physical layer. For details, refer to ANSI T1.403 and AT&T TR 54016.
Data in Interval 1: 0 Line Code Violations, 0 Path Code Violations 0 Ais Alarm Secs, 901 Los Alarm Secs 22 Slip Secs, 901 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins 0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 901 Unavail Secs	Statistics spanning the first interval. The statistical items are the same as those provided by the statistics spanning the current interval.
Data in Interval 2: 0 Line Code Violations, 0 Path Code Violations 0 Ais Alarm Secs, 900 Los Alarm Secs 23 Slip Secs, 900 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins 0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 900 Unavail Secs	Statistics spanning the second interval. The statistical items are the same as those provided by the statistics spanning the current interval.
Total Data (last 2 15 minute intervals): 0 Line Code Violations, 0 Path Code Violations 0 Ais Alarm Secs, 2087 Los Alarm Secs 52 Slip Secs, 2087 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins 0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 2087 Unavail Secs	Statistics spanning the last two intervals. The statistical items are the same as those provided by the statistics spanning the current interval.

ft1 bert (T1-F interface view)

Syntax **ft1 bert pattern** { **2^15** | **2^20** } **time** *minutes* [**unframed**]

undo ft1 bert

View T1-F interface view

Parameter **pattern**: Sets a bit error rate test (BERT) pattern, which could be 2^15 or 2^20.

2^15: Two to the fifteenth power, length of transmitted BERT pattern in bits.

2^20: Two to the twentieth power, length of transmitted BERT pattern in bits.

time *minutes*: Sets the duration (in minutes) of a BERT test. The *minute* argument is up to 1,440.

unframed: Sets the test pattern to cover the overhead bits of the frame.

Description Use the **ft1 bert** command to start a BERT test on a T1-F interface.

Use the **undo ft1 bert** command to stop the BERT test running on the T1-F interface.

ITU O.151, ITU O.153, and ANSI T1.403-1999 define many BERT patterns, among which, the T1-F interface supports only 2^15 and 2^20 at present.

When running a BERT test, the local end sends out a pattern, which is to be looped over somewhere on the line and back to the local end. The local end then checks the received pattern for bit error rate, and by so doing helps you identify the condition of the line. To this end, you must configure loopback to allow the transmitted pattern to loop back from somewhere on the line, for example, from the far-end interface by placing the interface in a far-end loopback.

You may view the state and result of the BERT test with the **display ft1 serial** command.

Example # Run a 10-minute 2^20 BERT test on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 bert pattern 2^20 time 10
```

ft1 cable

Syntax **ft1 cable** { **long** *decibel* | **short** *length* }

undo ft1 cable

View T1-F interface view

Parameter **long** *decibel*: Matches 199.6-meter (655-feet) and longer cable length. The argument *decibel* can take **0db**, **-7.5db**, **-15db**, or **-22.5db**, depending on the signal quality at the receiving end. In this case, no external CSU is required.

short *length*: Matches a cable length shorter than 199.6 meters (655 feet). The argument *length* can take **133ft**, **266ft**, **399ft**, **533ft**, or **655ft**, depending on the actual transmission distance.

Description Use the **ft1 cable** command to set the cable attenuation and length on the T1-F interface.

Use the **undo ft1cable** command to restore the default, that is, **long 0db**.

You may use this command to adapt signal waveform to different transmission conditions such as the quality of the signal received by the receiver. If the signal quality is good, you can just use the default setting.

Example # Set the cable length to 40.5 meters (133 feet) on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0]ft1 cable short 133ft
```

ft1 clock

Syntax **ft1 clock** { **master** | **slave** }

undo ft1 clock

View T1-F interface view

Parameter **master**: Adopts the internal clock as the clock source.

slave: Adopts the line clock as the clock source.

Description Use the **ft1 clock** command to configure the clock source for the T1-F interface.

Use the **undo ft1 clock** command to restore the default, that is, line clock.

When the T1-F interface is working as DCE, choose the internal clock for it. When it is working as DTE, choose the line clock for it.

When the T1-F interfaces on two routers are directly connected, one interface must work in master clock mode to provide the clock source while the other in slave clock mode to accept.

When the T1-F interface on your router is connected to an exchange, it is working as DTE and therefore must be configured with the slave clock mode to accept the line clock provided by the exchange working as DCE.

Example # Use the internal clock as the clock source on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 clock master
```

ft1 code

Syntax **ft1 code** { **ami** | **b8zs** }

undo ft1 code

View T1-F interface view

Parameter **ami**: Adopts AMI line code format.

b8zs: Adopts B8ZS line code format.

Description Use the **ft1 code** command to set the line code format for the T1-F interface.

Use the **undo ft1 code** command to restore the default, that is, B8ZS.

Keep the line code format of the interface in consistency with the one used on the remote device.

Example # Set the line code format of T1-F interface Serial 2/0 to AMI.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 code ami
```

ft1 data-coding

Syntax **ft1 data-coding** { **inverted** | **normal** }

undo ft1 data-coding

View T1-F interface view

Parameter **inverted**: Enables user data inversion.

normal: Disables user data inversion.

Description Use the **ft1 data-coding normal** command to disable user data inversion for a T1-F interface.

Use the **ft1 data-coding inverted** command to enable user data inversion for a T1-F interface.

Use the **undo ft1 data-coding** command to restore the default.

By default, data inversion is disabled.

To prevent 7e in valid data from being taken for stuffing characters, HDLC inserts a zero after every five ones in the data stream. Then, HDLC inverts every one bit into a zero and every zero bit into a one. This ensures at least at least one out of every eight bits is a one. When AMI encoding is adopted on a T1-F interface, the use of data inversion can eliminate presence of multiple consecutive zeros.

At the two ends of a T1-F line, the same data inversion setting must be adopted.

Example # Enable user data inversion on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 data-coding inverted
```

ft1 fdl

Syntax **ft1 fdl** { **ansi** | **att** | **both** | **none** }

undo ft1 fdl

View T1-F interface view

Parameter **ansi**: Adopts ANSI T1.403 for FDL.

att: Adopts AT&T TR 54016 for FDL.

both: Adopts both ANSI T1.403 and AT&T TR 54016 for FDL.

none: Disables FDL.

Description Use the **ft1 fdl** command to set the behavior of the T1-F interface on the FDL in ESF framing.

Use the **undo ft1 fdl** command to restore the default.

By default, FDL is disabled.

FDL is an embedded 4 kbps overhead channel within the ESF format for transmitting performance statistics or loopback code.

You can however change the setting depending on the setting at the far end.

Example # Implement ANSI T1.403 FDL on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 fdl ansi
```

ft1 frame-format

Syntax **ft1 frame-format** { **esf** | **sf** }

undo ft1 frame-format

View T1-F interface view

Parameter **esf**: Sets the framing format on the T1-F interface to ESF.

sf: Sets the framing format on the T1-F interface to SF.

Description Use the **frame-format** command to set the framing format on the T1-F interface.

Use the **undo frame-format** command to restore the default, that is, **esf**.

T1-F interfaces support two framing formats, that is, SF and ESF. In SF format, multiple frames can share the same FSC and signaling information, so that more significant bits are available for transmitting user data. The use of ESF allows you to test the system without affecting the ongoing service.

Example # Set the framing format of T1-F interface Serial 2/0 to SF.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 frame-format sf
```

ft1 idlecode

Syntax **ft1 idlecode** { **7e** | **ff** }

undo ft1 idlecode

View T1-F interface view

Parameter **7e**: Sets the line idle code to 0x7E.

ff: Sets the line idle code to 0xFF.

Description Use the **ft1 idlecode** command to set the line idle code on the T1-F interface. Two types of line idle code are available: 0x7E and 0xFF.

Use the **undo ft1 idlecode** command to restore the default, that is, 0x7E.

The line idle code is sent in the timeslots that are not bundled into the logical channels on the interface.

Example # Set the line idle code to 0x7E on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 idlecode 7e
```

ft1 itf

Syntax **ft1 itf** { **number** *number* | **type** { **7e** | **ff** } }

undo ft1 itf { **type** | **number** }

View T1-F interface view

Parameter **number** *number*: Sets the number of interframe filling tags (a interframe filling tag is one byte in length). The *number* argument ranges from 0 to 14.

type { **7e** | **ff** }: Sets the interframe filling tag to 0x7E by specifying the **7e** keyword or to 0xFF by specifying the **ff** keyword. On a T1-F interface, the default interframe filling tag is 0x7E.

Description Use the **ft1 itf** command to set the type and the number of interframe filling tags on the T1-F interface. Two types of interframe filling tag are available: 0x7E and 0xFF.

Use the **undo ft1 itf** command to restore the default.

By default, the interframe filling tag is 0x7E, and the number of interframe filling tags is four.

Interframe filling tags are sent when no service data is sent on the timeslots bundled into logical channels on a T1-F interface.

Do not use the **ft1 itf type ff** command if both the **ft1 code ami** command and the **ft1 data-coding inverted** command are configured so that the T1-F interface can function normally.

Example # Set the interframe filling tag to 0xFF on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 itf type ff
```

Set the number of interframe filling tags to five on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 itf number 5
```

ft1 loopback

Syntax **ft1 loopback** { **local** | **payload** | **remote** }

undo ft1 loopback

View T1-F interface view

Parameter **local**: Sets the interface in internal loopback mode.

payload: Sets the interface in external payload loopback mode.

remote: Sets the interface in external loopback mode.

Description Use the **ft1 loopback** command to set the T1-F interface in a loopback mode.

Use the **undo ft1 loopback** command to restore the default.

By default, loopback is disabled.

Loopback is intended for checking the condition of interfaces or cables. Disable it otherwise.

The three loopback modes cannot be used at the same time on a T1-F interface.

Example # Set T1-F interface Serial 2/0 in local loopback mode.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0]ft1 loopback local
```

ft1 timeslot-list

Syntax **ft1 timeslot-list** *list* [**speed** { **56k** | **64k** }]

undo ft1 timeslot-list

View T1-F interface view

Parameter *list*: Specifies timeslots to be bundled. They are numbered 1 through 31. You may specify a single timeslot by specifying its number, a range of timeslots by specifying a range in the form of *number1*-*number2*, or several discrete timeslots by specifying *number1*, *number2*-*number3*.

speed { **56k** | **64k** }: Time slot bundling speed in kbps. If **56k** applies, timeslots are bundled into an N × 56 kbps bundle. If **64k** (the default) applies, timeslots are bundled into an N × 64 kbps bundle.

Description Use the **ft1 timeslot-list** command to bundle timeslots on a T1-F interface.

Use the **undo ft1 timeslot-list** command to restore the default.

By default, all the timeslots on the T1-F interface are bundled to form a 1536 kbps interface.

Timeslot bundling results in interface rate change. For example, after you bundle timeslots 1 through 10 on the interface, the interface rate becomes 10 × 64 kbps or 10 × 56 kbps.

Only one channel set can be created on a T1-F interface, and this channel set is associated with the current synchronous serial interface. On a CT1/PRI interface, however, you may create multiple channel sets; for each of them, the system automatically creates a synchronous serial interface.

Example # Bundle timeslots 1, 2, 5, 10 through 15, and 18 on T1-F interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 timeslot-list 1,2,5,10-15,18
```

ft1 alarm-threshold

Syntax **ft1 alarm-threshold** { **ais** { **level-1** | **level-2** } | **lfa** { **level-1** | **level-2** | **level-3** | **level-4** } | **los** { **pulse-detection** | **pulse-recovery** } *value* }

undo ft1 alarm-threshold

View T1-F interface view

Parameter **ais**: Sets the alarm threshold of alarm indication signal (AIS), which can be **level-1** and **level-2**.

- The **level-1** keyword specifies to generate an AIS alarm when the number of 0s in the bit stream of an SF or ESF frame is less than or equal to 2.
- The **level-2** keyword specifies to generate an AIS alarm when the number of 0s is less than or equal to 3 in the bit stream of an SF frame or less than or equal to 5 in the bit stream of an ESP frame.

By default, level-1 AIS alarm threshold applies.

lfa: Sets the loss of frame align (LFA) alarm threshold, which can be **level-1**, **level-2**, **level-3**, and **level-4**.

- The **level-1** keyword specifies to generate an LFA alarm when two of four frame alignment bits are lost.
- The **level-2** keyword specifies to generate an LFA alarm when two of five frame alignment bits are lost.
- The **level-3** keyword specifies to generate an LFA alarm when two of six frame alignment bits are lost.
- The **level-4** keyword applies only to ESF frames. It specifies to generate an LFA alarm when errors are detected in four consecutive ESF frames.

By default, level-1 LFA alarm threshold applies.

los: Sets a loss of signal (LOS) alarm threshold, which can be **pulse-detection** (for the pulse detection duration threshold with LOS) and **pulse-recovery** (for the pulse threshold with LOS).

The threshold of pulse-detection, in units of pulse intervals, ranges from 16 to 4,096 and defaults to 176.

The threshold of pulse-recovery, ranges from 1 to 256 and defaults to 22.

If the number of the pulses detected during the total length of the specified pulse detection intervals is smaller than the pulse-recovery threshold, a LOS alarm occurs. For example, if the two thresholds take their defaults, a LOS alarm is created if the number of pulses detected within 176 pulse intervals is less than 22.

Description Use the **ft1 alarm-threshold** command to set LOS, AIS, or LFA alarm thresholds on the T1-F interface.

Use the **undo ft1 alarm-threshold** command to restore the defaults.

Example # Set the number of detection intervals to 300 for the pulse detection duration threshold.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 alarm-threshold los pulse-detection 300
```

ft1 sendloopcode

Syntax **ft1 sendloopcode** { **fdl-ansi-llb-down | fdl-ansi-llb-up | fdl-ansi-plb-down | fdl-ansi-plb-up | fdl-att-plb-down | fdl-att-plb-up | inband-llb-down | inband-llb-up** }

View T1-F interface view

Parameter **fdl-ansi-llb-down**: Sends ANSI-compliant LLB deactivation request code in the FDL to removes loopback.

fdl-ansi-llb-up: Sends ANSI-compliant line loopback (LLB) activation request code in the FDL to start remote loopback.

fdl-ansi-plb-down: Sends ANSI-compliant PLB deactivation request code in the FDL to remove loopback.

fdl-ansi-plb-up: Sends ANSI-compliant payload loopback (PLB) activation request code in the FDL to start remote loopback.

fdl-att-plb-down: Sends AT&T-complaint PLB deactivation request code in the FDL to remove loopback.

fdl-att-plb-up: Sends AT&T-complaint PLB activation request code in the FDL to start remote loopback.

inband-llb-down: Sends in-band LLB deactivation request code compliant with the ANSI or AT&T implementation to remove loopback.

inband-llb-up: Sends in-band line loopback (LLB) activation request code compliant with the ANSI or AT&T implementation to start remote loopback.

Description Use the **ft1 sendloopcode** command to send remote loopback control code.

By default, no remote loopback control code is sent.

You may configure loopback on the far-end T1-F interface by sending loopback request code.

In LLB mode, all 193 bits (one synchronization bit and 192 effective bandwidth bits) in a T1 PCM frame are looped back. In PLB mode, however, only 192 effective bandwidth bits are looped back.

The format of loopback code can be compliant with ANSI T1.403 or AT&T TR 54016.

In SF framing, LLB code is sent using the effective bandwidth (slots 1 through 24). In ESF framing, both LLB code and PLB code are sent/received in the FDL in ESF frames.

You can use this command only when the far-end CT1/PRI interface can automatically detect loopback request code from the network.

Example # Send in-band LLB activation request code.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ft1 sendloopcode inband-llb-up
```

16 FUNDAMENTAL CE3 INTERFACE CONFIGURATION COMMANDS

bert (CE3 Interface)

Syntax **bert pattern** { **2^7** | **2^11** | **2^15** | **qrss** } **time** *number* [**unframed**]

undo bert

View CE3 interface view

Parameter **pattern**: Specifies BERT test mode, which can be 2^7, 2^11, 2^15, and QRSS.

2^7: Specifies the code stream transmitted is the 7th power of 2 bits in length.

2^11: Specifies the code stream transmitted is the 11th power of 2 bits in length.

2^15: Specifies the code stream transmitted is the 15th power of 2 bits in length.

qrss: Specifies the code stream transmitted is the 20th power of 2 bits in length and the number of successive 0s in the code stream is no more than 14.

time *number*: Sets the duration (in minutes) of a BERT teat. The *number* argument is in the range 1 to 1,440.

unframed: Sets the overhead bits of the padding frames for BERT test.

Description Use the **bert** command to enable BERT test.

Use the **undo bert** command to disable BERT test.

Multiple BERT test modes exist, as defined in ITU O.151, ITU O.153, and ANSI T1.403-1999. Currently, 2^7, 2^11, 2^15, and QRSS are available on a CE3 interface.

To perform a BERT test, the local end transmits test data stream, which is returned after reaching specific nodes. The local end then checks for the bit error rate by comparing the returned data stream with the original, through which the state of the link can be determined. BERT test requires that data stream can be looped back on specific nodes. You can achieve this by enabling remote loop back on the peer.

You can use the **bert** command to set the test mode and the test duration. During the process of a BERT test, you can check the state and the result of the test. For more information, refer to “display controller e1” on page 205.

Example # Perform BERT test in QRSS mode on CE3 2/0 interface, setting the duration to ten minutes.

```
<Sysname> system-view
[Sysname] interface E3 2/0
[Sysname-E3 2/0] bert pattern qrss time 10
```

clock (CE3 interface view)

Syntax **clock** { **master** | **slave** }

undo clock

View CE3 interface view

Parameter **master**: Adopts the internal clock as the clock source.

slave: Adopts the line clock as the clock source.

Description Use the **clock** command to configure clock source for the CE3 interface.

Use the **undo clock** command to restore the default, that is, line clock.

The clock source is selected depending on the connected remote device. If connected to a transmission device, the local end uses the line clock. If connected to a CE3 interface on another router, the local end can use whichever clock so long as it is different from the one adopted at the remote end.

Example # Use the internal clock as the clock source on CE3 interface E3 2/0.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] clock master
```

controller e3

Syntax **controller e3** *interface-number*

View System view

Parameter *interface-number*: CE3 interface number.

Description Use the **controller e3** command to enter CE3 interface view.

Related command: **display controller e3**.

Example # Enter the view of interface E3 2/0.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0]
```

crc

Syntax **crc** { **16** | **32** | **none** }

undo crc

View Synchronous serial interface view

Parameter **16**: Adopts 16-bit CRC.

32: Adopts 32-bit CRC.

none: Adopts no CRC.

Description Use the **crc** command to configure CRC mode for a synchronous serial interface formed by CE3 interfaces.

Use the **undo crc** command to restore the default, that is, 16-bit CRC.

Related command: **e1 channel-set**, **e1 unframed**, **using (CT3 interface view)**.

Example # Apply 32-bit CRC to a serial interface formed on interface E3 2/0 in unchannelized mode.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] using e3
[Sysname-E3 2/0] quit
[Sysname] interface serial 2/0/0:0
[Sysname-Serial2/0/0:0] crc 32
```

Apply 16-bit CRC to a serial interface formed on interface E3 2/0 in unchannelized mode.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] t1 3 channel-set 5 timeslot-list 1-20
[Sysname-E3 2/0] quit
[Sysname] interface serial 2/0/3:5
[Sysname-Serial2/0/3:5] crc 16
```

display controller e3

Syntax **display controller e3** [*interface-number*]

View Any view

Parameter *interface-number*: CE3 interface number. In conjunction with the **e3** keyword, it specifies a CE3 interface.

Description Use the **display controller e3** command to display state information about one specified or all CE3 interfaces.

In addition to the state information of the CE3 interface, the command displays information about each E1 line on the CE3 interface if the interface is working in CE3 mode.

Example # Display information about interface E3 2/0.

```
<Sysname> display controller e3 2/0
  E3 2/0 is up
  Description : E3 2/0 Interface
  Applique type is CE3 - 75 OHM unbalanced  Frame-format G751, line
code HDB3, clock slave, national-bit 1,loopback not set
  Alarm: none
  ERROR: 0 BPV, 0 EXZ, 0 FrmErr, 0 FEBE
E3-0  CE1 1 is up
  Frame-format NO-CRC4, clock master, loopback not set
E3-0  CE1 2 is up
  Frame-format NO-CRC4, clock slave, loopback local
E3-0  CE1 3 is up
  Frame-format NO-CRC4, clock slave, loopback remote
E3-0  CE1 4 is up
  Frame-format CRC4, clock slave, loopback not set
E3-0  CE1 5 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 6 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 7 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 8 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 9 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 10 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 11 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 12 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 13 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 14 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 15 is up
  Frame-format NO-CRC4, clock slave, loopback not set
E3-0  CE1 16 is up
  Frame-format NO-CRC4, clock slave, loopback not set
```

e1 bert

Syntax **e1** *line-number* **bert pattern** { **2^11** | **2^15** | **2^20** | **2^23** | **qrss** } **time** *number* [**unframed**]

undo e1 *line-number* **bert**

View CE3 interface view

Parameter *line-number*: E1 channel number, in the range 1 to 28.

pattern: Specifies BERT test mode, which can be 2^11, 2^15, 2^20, 2^23, and QRSS.

2^11: Specifies the code stream transmitted is the 11th power of 2 bits in length.

2^15: Specifies the code stream transmitted is the 15th power of 2 bits in length.

2^20: Specifies the code stream transmitted is the 20th power of 2 bits in length.

2^23: Specifies the code stream transmitted is the 23th power of 2 bits in length.

qrss: Specifies the code stream transmitted is the 20th power of 2 bits in length and the number of successive 0s in the code stream is no more than 14.

time *number*: Sets the duration (in minutes) of a BERT teat. The *number* argument is in the range 1 to 1,440.

unframed: Sets the overhead bits of the padding frames for BERT test.

Description Use the **e1 bert** command to enable BERT test for an E1 channel created on a CE3 interface.

Use the **undo e1 bert** command to disable BERT test.

Multiple BERT test modes exist, as defined in ITU O.151, ITU O.153, and ANSI T1.403-1999. Currently, 2^11, 2^15, 2^20, 2^23, and QRSS are available on E1 channels created on CE3 interfaces.

To perform a BERT test, the local end transmits test data stream, which is returned after reaching specific nodes. The local end then checks for the bit error rate by comparing the returned data stream with the original, through which the state of the link can be determined. BERT test requires that data stream can be looped back on specific nodes. You can achieve this by enabling remote loop back on the peer.

You can use the **bert** command to set the test mode and the test duration. During the process of a BERT test, you can check the state and the result of the test. For more information, refer to “display controller e1” on page 205.

Example # Perform BERT test in QRSS mode on E1 channel 1 created on CE3 2/0 interface, setting the duration to ten minutes.

```
<Sysname> system-view
[Sysname] interface e3 2/0
[Sysname-E3 2/0] e1 1 bert pattern qrss time 10
```

e1 channel-set

Syntax **e1** *line-number* **channel-set** *set-number* **timeslot-list** *list*

undo e1 *line-number* **channel-set** *set-number*

View CE3 interface view

Parameter *line-number*: E1 line number in the range 1 to 16.

set-number: Number of the channel set formed by a timeslot bundle on the E1 line. It ranges from 0 to 30.

timeslot-list *list*: Specifies timeslots to be bundled. The *list* argument is timeslot numbers, in the range of 1 to 31. You may specify a single timeslot by specifying a number, a range of timeslots by specifying a range in the form of *number1***-***number2*, or several discrete timeslots by specifying *number1*, *number2***-***number3*.

Description Use the **e1 channel-set** command to bundle timeslots on an E1 line.

Use the **undo e1 channel-set** command to remove a timeslot bundle.

By default, no timeslots are bundled into channel sets.

A CE3 interface can be channelized into 64 kbps lines and the timeslots on each E1 line can be bundled into up to 31 channels.

When an E1 line operates in framed (CE1) mode, you can bundle timeslots on it into channel sets. For each channel set, the system automatically creates a serial interface numbered **serial** *number***/***line-number***:***set-number*. For example, the serial interface formed by channel set 0 on the first E1 line on E3 1/0 is numbered 1/0/1:0. This interface can operate at N × 64 kbps and is logically equivalent to a synchronous serial interface on which you can make other configurations.

Related command: **e1 unframed**.

Example # Create a 128 kbps serial interface on the first E1 channel on interface E3 2/0.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] e1 1 channel-set 1 timeslot-list 1,2
```

e1 set clock

Syntax **e1** *line-number* **set clock** { **master** | **slave** }

undo e1 *line-number* **set clock**

View CE3 interface view

Parameter *line-number*: E1 line number in the range 1 to 16.

master: Adopts the internal clock as the clock source.

slave: Adopts the line clock as the clock source.

Description Use the **e1 set clock** command to configure clock source for an E1 line on the CE3 interface.

Use the **undo e1 clock** command to restore the default, that is, line clock.

When the CE3 interface is working in channelized mode, you can set separate clock for each E1 line on it.

Example # Use the internal clock as the clock source on the first E1 line on interface E3 2/0.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] e1 1 set clock slave
```

e1 set frame-format

Syntax **e1** *line-number* **set frame-format** { **crc4** | **no-crc4** }

undo e1 *line-number* **set frame-format**

View CE3 interface view

Parameter *line-number*: E1 line number in the range 1 to 16.

crc4: Sets the frame format to CRC4.

no-crc4: Sets the frame format to no-CRC4.

Description Use the **e1 set frame-format** command to set framing format for an E1 line.

Use the **undo e1 set frame-format** command to restore the default, that is, no-CRC4.

Configure this command only when the specified E1 line is working in framed format (which can be set using the **undo e1 unframed** command).

Related command: **e1 unframed**.

Example # Set the framing format to CRC4 for the first E1 line on interface E3 2/0.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] e1 1 set frame-format crc4
```

e1 set loopback

Syntax **e1** *line-number* **set loopback** { **local** | **payload** | **remote** }

undo e1 *line-number* **set loopback**

View CE3 interface view

Parameter *line-number*: E1 line number in the range 1 to 16.

local: Sets the E1 line in internal loopback mode.

payload: Sets the E1 line in payload loopback mode.

remote: Sets the E1 line in external loopback mode.

Description Use the **e1 set loopback** command to set an E1 line in a loopback mode on the E3 interface.

Use the **undo e1 set loopback** command to restore the default.

By default, loopback is disabled on E1 lines.

If an E1 line encapsulated with PPP is in loopback mode, it is normal that the state of the link layer protocol is reported down.

Example # Set the first E1 line on interface E3 2/0 in internal loopback mode.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] e1 1 set loopback local
```

e1 shutdown

Syntax **e1** *line-number* **shutdown**

undo e1 *line-number* **shutdown**

View CE3 interface view

Parameter *line-number*: E1 line number in the range 1 to 16.

Description Use the **e1 shutdown** command to shut down an E1 line on the CE3 interface.

Use the **undo e1 shutdown** command to restore the default.

By default, E1 lines are up.

This command affects not only the specified E1 line but also the serial interfaces formed by E1 line bundling. Performing the **e1 shutdown** command on the specified E1 line shuts down all these serial interfaces. Data transmission and receiving stop as a result. Likewise, performing the **undo e1 shutdown** command restarts all these serial interfaces.

Example # Shut down the first E1 line on interface E3 2/0.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] e1 1 shutdown
```

e1 unframed

Syntax **e1** *line-number* **unframed**

undo e1 *line-number* **unframed**

View CE3 interface view

Parameter *line-number*: E1 line number in the range 1 to 16.

Description Use the **e1 unframed** command to set an E1 line on the CE3 interface to work in unframed mode (E1 mode).

Use the **undo e1 unframed** command to restore the default.

By default, an E1 line operates in framed mode (CE1 mode).

An E1 line in unframed mode does not contain the frame control information; it cannot be divided into timeslots. The system automatically creates a serial interface numbered **serial** *number***/***line-number***:0** for it. This interface operates at 2048 kbps and is logically equivalent to a synchronous serial interface on which you can make other configurations.

Related command: **e1 channel-set**.

Example # Set the first E1 line on interface E3 2/0 to operate in unframed mode.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] e1 1 unframed
```

fe3

Syntax **fe3** { **dsu-mode** { **0** | **1** } | **subrate** *number* }

undo fe3 { **dsu-mode** | **subrate** }

View CE3 interface (in FE3 mode) view

Parameters **dsu-mode**: Specifies the FE3 (Fractional E3) DSU mode for a CE3 interface operating in FE3 mode. This keyword can be followed by **0** or **1** keyword, as described below:.

0: Specifies the Digital Link mode, where the subrate is a multiple of 358 kbps and ranges from 358 to 34010 kbps (that is, up to 95 rate levels are available).

1: Specifies the Kentrox mode, where the subrate is a multiple of 500 kbps and ranges from 500 to 24500 kbps. In this mode, the subrate can also be 34010 kbps, making a total of 50 rate levels.

subrate *number*: Specifies the subrate for the CE3 interface. The *number* argument ranges from 1 to 34010 (in kbps).

Description Use the **fe3** command to configure a CE3 interface to operate in the FE3 mode and set the DSU mode or the subrate.

Use the **undo fe3** command to restore the default.

By default, DSU mode 1 (the Kentrox mode) is adopted, and the subrate is 34010 kbps.

FE3 mode is a non-standard E3 application mode. In this mode, the subrate level setting varies with vendors. You can use the **fe3** command to make the device to be compatible with devices of other vendors operating in specific FE3 DSU modes.

Note that:

- These two commands are only applicable to CE3 boards that support FE3.
- These two commands are only available in E3 mode.
- As for the **fe3 subrate** command, the actual subrate usually is not exactly the one set by the command. That is, after you set the subrate by using the **fe3 subrate** command, the CE3 interface searches the subrate levels corresponding to the DSU mode it is operating in and selects the one that is closest to that set by the command as its subrate. The device then adjusts the hardware to allow for the subrate.
- You can use the **display interface serial interface-number:0** command to check the DSU mode setting, the subrate, the actual rate, and the baudrate of a CE3 interface. Note that the actual rate does not count in the overhead bits, and the baudrate is the actual E3 line rate (that is, 34368 kbps), with the overhead bits counted in.

Examples # Configure E3 2/0 interface to operate in the FE3 mode, setting the DSU mode to 1 and the subrate to 3000 kbps.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] using e3
[Sysname-E3 2/0] fe3 dsu-mode 1
[Sysname-E3 2/0] fe3 subrate 3000
```

loopback (CE3 interface view)

Syntax **loopback { local | payload | remote }**

undo loopback

View CE3 interface view

Parameter **local**: Enables internal loopback on the CE3 interface.

payload: Enables external payload loopback on the CE3 interface.

remote: Enables external loopback on the CE3 interface.

Description Use the **loopback** command to configure the loopback mode of the CE3 interface.

Use the **undo loopback** command to restore the default.

By default, loopback is disabled on the CE3 interface.

Loopback is intended for test use. Disable it otherwise.

If a CE3 interface encapsulated with PPP is placed in a loopback, it is normal that the state of the link layer protocol is reported down.

Example # Enable internal loopback on interface E3 2/0.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] loopback local
```

national-bit

Syntax **national-bit { 0 | 1 }**

undo national-bit

View CE3 interface view

Parameter **0**: Sets the national bit of the CE3 interface to 0.

1: Sets the national bit of the CE3 interface to 1.

Description Use the **national-bit** command to configure the national bit on the CE3 interface.

Use the **undo national-bit** command to restore the default, that is, 1.

You need to set the national bit to 0 on an E3 interface only in some special circumstances.

Related command: **controller e3**.

Example # Set the national bit to 0 on interface E3 2/0.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] national-bit 0
```

using (CE3 interface view)

Syntax **using** { **ce3** | **e3** }

undo using

View CE3 interface view

Parameter **ce3**: Sets the CE3 interface to work in channelized mode.

e3: Sets the CE3 interface to work in unchannelized mode.

Description Use the **using** command to configure the operating mode of the CE3 interface.

Use the **undo using** command to restore the default, that is, channelized mode.

Only when the CE3 interface is working in channelized mode can you configure E1 lines.

When the CE3 interface is working in unchannelized mode, the system automatically creates a serial interface numbered **serial** *number***/0:0** for it. This interface operates at 34.368 Mbps and is logically equivalent to a synchronous serial interface on which you can make other configurations.

Related command: **controller e3**.

Example # Configure interface E3 2/0 to operate in unchannelized mode.

```
<Sysname> system-view
[Sysname] controller e3 2/0
[Sysname-E3 2/0] using e3
```

17 FUNDAMENTAL CT3 INTERFACE CONFIGURATION COMMANDS

alarm (CT3 interface view)

Syntax **alarm** { **detect** | **generate** { **ais** | **febe** | **idle** | **rai** } }

undo alarm { **detect** | **generate** { **ais** | **febe** | **idle** | **rai** } }

View CT3 interface view

Parameter **detect**: Enables/disables periodical alarm signal detection. By default, periodical alarm detection is enabled.

generate: Sends alarm signals, which can be AIS, RAI, idle, or FEBE for line state test. By default, alarm signal sending is disabled.

ais: Alarm indication signal.

febe: Far end block error signal.

idle: Idle signal.

rai: Remote alarm indication signal.

Description Use the **alarm** command to enable the CT3 interface to detect/send alarm signals.

Use the **undo alarm** command to remove the alarm signal detection/sending setting.

At the startup of your device, periodical alarm signal detection is enabled on the CT3 interface. When detecting LOS, LOF, or AIS signals, the interface sends RAI signals to its peer. Alarm state report for the interface is real time; you may view that by performing the **display controller t3** command.

The supported alarm signals, LOS, LOF, AIS, RAI, FEBE, and idle, are ANSI T1.107-1995 compliant.

You can only configure the CT3 interface to send a type of alarm signal. To have the interface send another type of signal, use the **undo alarm** command to remove the previous setting first. In addition, when the RAI signal generated upon detection of the LOS, LOF, or AIS signal is present, the CT3 interface cannot send another type of signal. To do that, use the **undo alarm detect** command to disable the CT3 interface to send the RAI signal generated after detecting an alarm first.

Example # Enable periodical alarm signal detection on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] alarm detect
```

Enable CT3 interface T3 2/0 to send AIS alarm signals.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] alarm generate ais
```

bert (CT3 interface view)

Syntax **bert pattern** { **2^7** | **2^11** | **2^15** | **qrss** } **time** *number* [**unframed**]

undo bert

View CT3 interface view

Parameter **pattern**: Sets a bit error rate test (BERT) pattern, which could be 2^7, 2^11, 2^15, or QRSS.

2^7: Two to the seventh power, length of the transmitted BERT pattern in bits.

2^11: Two to the eleventh power, length of the transmitted BERT pattern in bits.

2^15: Two to the fifteenth power, length of the transmitted BERT pattern in bits.

qrss: Two to the twentieth power, length of the transmitted BERT pattern in bits. In this pattern, the presence of 14 consecutive zeros is not allowed.

time *number*: Sets the duration of a BERT test, in the range 1 to 1440 minutes.

unframed: Sets the test pattern to cover the overhead bits of the frame.

Description Use the **bert** command to start a BERT test on the CT3 interface.

Use the **undo bert** command to stop the BERT test running on the CT3 interface.

ITU O.151, ITU O.153, and ANSI T1.403-1999 define many BERT patterns, among which, the CT3 interface supports only 2^7, 2^11, 2^15, and QRSS at present.

When running a BERT test, the local end sends out a pattern, which is to be looped over somewhere on the line and back to the local end. The local end then checks the received pattern for bit error rate, and by so doing helps you identify whether the condition of the line is good. To this end, you must configure loopback to allow the transmitted pattern to loop back from somewhere on the line, for example, from the far-end interface by placing the interface in far-end loopback.

You may view the state and result of the BERT test with the **display controller t3** command.

Example # Run a 10-minute QRSS BERT test on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] bert pattern qrss time 10
```

cable (CT3 interface view)

Syntax **cable** *feet*

undo cable

View CT3 interface view

Parameter *feet*: Cable length in the range 0 to 450 feet (0 to 137.2 meters).

Description Use the **cable** command to configure the cable length on the CT3 interface.

Use the **undo cable** command to restore the default, that is, 49 feet (14.9 meters).

The cable length in this command refers to the distance between the router and the cable distribution rack.

Example # Set the cable length to 50 feet (15.2 meters) on interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] cable 50
```

clock (CT3 interface view)

Syntax **clock** { **master** | **slave** }

undo clock

View CT3 interface view

Parameter **master**: Adopts the internal clock as the clock source.

slave: Adopts the line clock as the clock source.

Description Use the **clock** command to configure clock source for the CT3 interface.

Use the **undo clock** command to restore the default, that is, line clock.

The clock source is selected depending on the connected remote device. If connected to a transmission device, the local end uses the line clock. If connected to a CT3 interface on another router, the local end can use whichever clock so long as it is different from the one adopted at the remote end.

Example # Use the internal clock as the clock source on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] clock master
```

controller t3

Syntax **controller t3** *interface-number*

View System view

Parameter *interface-number*: CT3 interface number.

Description Use the **controller t3** command to enter CT3 interface view.

Related command: **display controller t3**.

Example # Enter the view of interface T3 2/0.

```
<Sysname> system-view
[Sysname] controller t3 2/0
[Sysname-T3 2/0]
```

crc

Syntax **crc** { **16** | **32** | **none** }

undo crc

View Synchronous serial interface view

Parameter **16**: Adopts 16-bit CRC.

32: Adopts 32-bit CRC.

none: Adopts no CRC.

Description Use the **crc** command to configure CRC mode for the serial interface formed on CT3 interfaces.

Use the **undo crc** command to restore the default, that is, 16-bit CRC.

These two commands apply to serial interfaces formed on T3 channels, T1 channels, and the interfaces formed by binding slots of T1 channels.

Related command: **t1 channel-set**, **t1 unframed**, **using (CT3 interface view)**.

Example # Apply 32-bit CRC to a serial interface formed on interface T3 2/0 in unchannelized mode.

```
<Sysname> system-view
[Sysname] controller t3 2/0
[Sysname-T3 2/0] using t3
[Sysname-T3 2/0] quit
[Sysname] interface serial 2/0/0:0
[Sysname-Serial2/0/0:0] crc 32
```

Apply 16-bit CRC to a serial interface formed on interface CT3 2/0 in channelized mode.

```
<Sysname> system-view
[Sysname] controller t3 2/0
[Sysname-T3 2/0] t1 2 channel-set 4 timeslot-list 5-11
[Sysname-T3 2/0] quit
[Sysname] interface serial 2/0/2:4
[Sysname-Serial2/0/2:4] crc 16
```

display controller t3

Syntax **display controller t3** [*interface-number*]

View Any view

Parameter *interface-number*: CT3 interface number. In conjunction with the **t3** keyword, it specifies a CT3 interface.

Description Use the **display controller t3** command to display state information about one specified or all CT3 interfaces.

In addition to the state information about the CT3 interface, the command displays information about each T1 line on the CT3 interface if the interface is working in CT3 mode.

Example # Display information about interface T3 2/0.

```
<Sysname> display controller t3 2/0
T3 2/0 current state :UP
Description : T3 2/0 Interface
sic Configuration:
  Work mode is CT3, cable length is 49 feet.
  Frame-format is C-BIT Parity, line code is B3ZS.
  Source clock is slave, loopback is not set.
Alarm state:
  Receiver alarm state is none.
MDL state:
  No message is sent now.
  Message data elements:
    EIC: line, LIC: line, FIC: line, UNIT: line
    FI: line, PORT_NO: line, GEN_NO: line
  Periodical detection is disabled.
FEAC state:
```

```
  No code is sent now.
  Periodical detection is enabled, no code received now.
BERT state:(stopped, not completed)
  Test pattern: 2^7, Status: Not Sync, Sync Detected: 0
    Time: 0 minute(s), Time past: 0 minute(s)
    Bit errors (since test started): 0 bits
    Bits received (since test started): 0 Mbits
    Bit errors (since latest sync): 0 bits
    Bits received (since latest sync): 0 Mbits
Historical Statistics:
Last clearing of counters: 14:39:02 UTC Sat 06/25/2005
  Data in current interval (22 seconds elapsed):
    0 Line Code Violations, 0 Far End Block Error
    0 C-Bit Coding Violation, 0 P-bit Coding Violation
    0 Framing Bit Err, 0 Severely Err Framing Secs
    0 C-bit Err Secs, 0 C-bit Severely Err Secs
    0 P-bit Err Secs, 0 P-bit Severely Err Secs
    0 Unavailable Secs, 0 Line Err Secs

T3 2/0  CT1 1 is up
  Frame-format ESF, clock slave, loopback not set
  FDL Performance Report is disabled
  Transmitter is sending none
  Receiver alarm state is none
  Line loop back deactivate code using inband signal last sent
  BERT state:(stopped, not completed)
    Test pattern: 2^11, Status: Not Sync, Sync Detected: 0
    Time: 0 minute(s), Time past: 0 minute(s)

    Bits received (since test started): 0 Kbits
    Bit errors (since latest sync): 0 bits
    Bits received (since latest sync): 0 Kbits
```

Table 21 Description on the fields of the display controller t3 command

Field	Description
T3 2/0 current state	Physical state of the interface: up or down
Description : T3 2/0 Interface	Description about the interface
Basic Configuration	Basic configurations of the interface
Work mode	Operating mode of the interface, CT3 or T3.
cable length	Cable length supported by the interface
Frame-format	Frame format: C-bit parity or M23
line code	In this output sample, line code is B3ZS.
Source clock	Clock source used by the interface: master for the internal clock or slave for the line clock
loopback	Loopback setting on the interface: local, remote, payload, or not set
Alarm State	Alarm state
Receiver alarm state	Type of the received alarm: none, LOS, LOF, RAI, or AIS. If a LOS, LOF, AIS was received, RAI would be sent and the screen displayed "Transmitter is sending RAI" instead.
MDL state	MDL state

Table 21 Description on the fields of the display controller t3 command

Field	Description
No message is sent now.	No MDL message is being sent. If an MDL message, path or idle-signal for example, was being sent, the screen would display "Message sent now: path. idle signal."
Message data elements	MDL data elements
EIC: line, LIC: line, FIC: line, UNIT: line	EIC, LIC, FIC, and UNIT are four elements present in all types of MDL messages. Their values are user configurable and default to line.
FI: line, PORT_NO: line, GEN_NO: line	FI is found in MDL path messages, PORT_NO in MDL idle signal messages, and GEN_NO in MDL test signal messages. Their values are user configurable and default to line.
Periodical detection	State of periodical detection of MDL, disabled by default at the startup of the router.
	When the function is enabled, the screen displays:
	Periodical detection is enabled.
	No message was received.
	When MDL messages are detected, the screen displays:
	Message received now: path.idle signal.
	EIC: line, LIC: line, FIC: line, UNIT: line
	path/FI: line
	idle Signal/PORT_NO: line
FEAC state	FEAC state
No code is sent now. DS3 Line Loop Back Deactivate was last sent.	No FEAC signal is sent. The FEAC signal sent last time is DS3 Line Loop Back Deactivate.
Periodical detection is enabled, no code received now.	Periodical detection of FEAC is enabled. This is the default applied at the startup of the router.
	No FEAC signal is received now.
DS3 Line Loop Back Deactivate last received.	The FEAC signal received last time is DS3 Line Loop Back Deactivate.
BERT state:(stopped, not completed)	BERT state: completed, stopped (not completed), or running.
Test pattern: 2^7, Status: Not Sync, Sync Detected: 0	Test pattern in use (such as 2^7, 2^11, 2^15, and QRSS), 2^7 in this sample output; synchronization state, and the number of detected synchronizations
Time: 0 minute(s), Time past: 0 minute(s)	The duration of the BERT test and the time that has elapsed
Bit errors (since test started): 0 bits	Number of bit errors received since the start of the BERT test
Bits received (since test started)	Number of bits received since the start of the BERT test
Bit errors (since latest sync)	Number of bit errors received since last synchronization
Bits received (since latest sync)	Number of bits received since last synchronization
Historical Statistics	Historical statistics
Last clearing of counters	Time when last counter clearing is performed, for example, 14:39:02 UTC Sat 06/25/2005. If no clearing is performed, "Never" is displayed.

Table 21 Description on the fields of the display controller t3 command

Field	Description
Data in current interval:	Statistics spanning the current 15-minute interval, coving the counts of these items:
Line Code Violations	Line code violations: BPV, or EXZ
Far End Block Error	Far-end block error
C-Bit Coding Violation	C-bit coding violation
P-bit Coding Violation	P-bit coding violation
Framing Bit Err	Framing bit error
Severely Err Framing Secs	C-bit erroneous second
C-bit Err Secs	C-bit severely erroneous second, that is, the second during which 44 C-bit errors occur
C-bit Severely Err Secs	P-bit erroneous second
P-bit Err Secs	P-bit severely erroneous second, that is, the second during which 44 P-bit errors occur
P-bit Severely Err Secs	Service unavailable second
Unavailable Secs	Line erroneous second, during which LOS, BPV, EXZ, C-bit, P-bit, and other errors occur
Line Err Secs	Data in interval 1
	Total data spanning the last 17 intervals
Data in Interval 1	State of T1 line on the CT3 interface: up or down. In this output sample, T1 line 1 is up.
Total Data (last 17 15 minute intervals)	Information about the T1 line:
T3 2/0 CT1 1 is up	Framing format-ESF or SF
Frame-format ESF, clock slave, loopback not set	Clock source-slave for the line clock and master for the internal clock
	Loopback-Local, remote, payload, or not set
	Transmission of PPR in the FDL is disabled. You may enable that with the **t1 set fdl ansi** command.
FDL Performance Report is disabled	The transmitter of the T1 line is sending RAI signals. When the T1 line receives LOS, LOF, or AIS signals, it sends RAI signals.
Transmitter is sending RAI	The type of alarm signal that the T1 line can receive: LOS, LOF, AIS, or RAI
Receiver alarm state is LOF	The loopback code sent last time is in-band LLB activation request code.
Line loop back activate code using inband signal last sent	BERT test state: running, complete, or stopped (not completed)
BERT state	Test pattern in use, 2^11 in this sample output; synchronization state, and the number of detected synchronizations
Test pattern	
Status	
Sync Detected	
Time	The duration of the BERT test and the time that has elapsed
Time past	
Bit errors (since test started)	Number of bit errors received since the start of the BERT test
Bits received (since test started)	Number of bits received since the start of the BERT test
Bit errors (since latest sync)	Number of bit errors received since the last synchronization

Table 21 Description on the fields of the display controller t3 command

Field	Description
Bits received (since latest sync)	Number of bits received since the last synchronization

feac (CT3 interface view)

Syntax **feac** { **detect** | **generate** { **ds3-los** | **ds3-ais** | **ds3-oof** | **ds3-idle** | **ds3-eqptfail** | **loopback** { **ds3-line** | **ds3-payload** } } }

undo feac { **detect** | **generate** { **ds3-los** | **ds3-ais** | **ds3-oof** | **ds3-idle** | **ds3-eqptfail** | **loopback** { **ds3-line** | **ds3-payload** } } }

View CT3 interface view

Parameter **detect**: Enables periodical far end and control signal (FEAC) channel signal detection. By default, periodical FEAC channel signal detection is enabled.

generate: Sends FEAC signals. Specify **ds3-los** for DS3 LOS, **ds3-ais** for DS3 AIS, **ds3-oof** for DS3 out of frame (OOF), **ds3-idle** for DS3 idle, and **ds3-eqptfail** for DS3 equipment failure. By default, FEAC signal sending is disabled.

loopback: Sends loopback code for activating far-end line loopback with the **ds3-line** keyword or payload loopback with the **ds3-payload** keyword. By default, loopback code sending is disabled.

Description Use the **feac** command to enable FEAC channel signal detection and sending on the CT3 interface.

Use the **undo feac** command to remove the current FEAC settings.

FEAC is a channel formed by using the third C-bit in the first subframe in C-bit framing. It is used to transmit alarm state signals for line test purpose or to transmit loopback control code for activating or deactivating far-end loopback during a loopback test.

According to ANSI T1.107a, the frame format used by FEAC channels is bit oriented protocol (BOP).

At the startup of your router, FEAC channel signal detection is enabled on the CT3 interface with FEAC signal sending disabled.

After far-end loopback is activated with the **feac generate loopback** { **ds3-line | ds3-payload** } command, you may remove it with the **undo** form of the command.

Disable FEAC detection before you configure far-end loopback to prevent loopback deadlock, which may happen when the local end enables loopback after detecting the loopback code sent back by the far end.

You may view the transmitting/receiving state of the FEAC channel with the **display controller t3** command.

Example # Enable FEAC channel signal detection on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] feac detect
```

Sends DS3 LOS signal on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] feac generate ds3-los
```

On CT3 interface T3 2/0, send loopback code to the far end to place the far end in a line loopback.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] feac generate loopback ds3-line
```

frame-format (CT3 interface view)

Syntax **frame-format** { **c-bit** | **m23** }

undo frame-format

View CT3 interface view

Parameter **c-bit**: Sets the framing format to C-bit.

m23: Sets the framing format to m23.

Description Use the **frame-format** command to configure the framing format used by the CT3 interface.

Use the **undo frame-format** command to restore the default, that is, C-bit framing format.

Example # Set the framing format of interface T3 2/0 to m23.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] frame-format m23
```

ft3

Syntax **ft3** { **dsu-mode** { **0** | **1** | **2** | **3** | **4** } | **subrate** *number* }

undo ft3 { **dsu-mode** | **subrate** }

View CT3 interface (in FT3 mode) view

Parameters **dsu-mode**: Specifies the FT3 (Fractional T3) DSU mode for a CT3 interface operating in FT3 mode. This keyword can be followed by **0**, **1**, **2**, **3**, and **4**, as described below.

0: Specifies the Digital Link mode, where the subrate is a multiple of 300746 bps and ranges from 300 to 44210 kbps (that is, up to 147 rate levels are available).

1: Specifies the Kentrox mode, where the subrate is a multiple of 1500 kbps and ranges from 1500 to 35000 kbps. In this mode, the subrate can also be 44210 kbps, making a total of 57 subrate levels.

2: Specifies the Larscom mode, where the subrate is a multiple of 3157835 bps and ranges from 3100 to 44210 kbps (that is, up to 14 subrate levels are available).

3: Specifies the Adtran mode, where the subrate is a multiple of 75187 bps and ranges from 75 to 44210 kbps (that is, up to 588 subrate levels are available).

4: Specifies the Verilink mode, where the subrate is a multiple of 1578918 bps and ranges from 1500 to 44210 kbps (that is, up to 20 subrate levels are available).

subrate *number*: Specifies the subrate for the CT3 interface. The *number* argument ranges from 1 to 44210 (in kbps).

Description Use the **ft3** command to configure a CT3 interface to operate in the FT3 mode and set the DSU mode or the subrate.

Use the **undo ft3** command to restore the default.

By default, DSU mode 0 (the Digital Link mode) is adopted, and the subrate is 44210 kbps.

FT3 (Fractional T3 or Subrate T3) mode is a non-standard E3 application mode. In this mode, the subrate level setting varies with vendors. You can use the **ft3** command to make the device to be compatible with devices of other vendors operating in specific FT3 DSU modes.

Note that:

- These two commands are only applicable to CT3 boards that support FT3.
- These two commands are only available in T3 mode.
- As for the **ft3 subrate** command, the actual subrate usually is not exactly the one set by the command. That is, after you set the subrate by using the **ft3 subrate** command, the CT3 interface searches the subrate levels corresponding to the DSU mode it is operating in and selects the one that is closest to that set by the command as its subrate. The device then adjusts the hardware to allow for the subrate.
- You can use the **display interface serial interface-number:0** command to check the DSU mode setting, the subrate, the actual rate, and the baudrate of a CT3 interface. Note that the actual rate does not count in the overhead bits, and the baudrate is the actual T3 line rate (that is, 44736 kbps), with the overhead bits counted in.

Examples # Configure T3 2/0 interface to operate in the FT3 mode, setting the DSU mode to 1 and the subrate to 3000 kbps.

```
<Sysname> system-view
[Sysname] controller t3 2/0
[Sysname-T3 2/0] using t3
[Sysname-T3 2/0] ft3 dsu-mode 1
[Sysname-T3 2/0] ft3 subrate 3000
```

loopback (CT3 interface view)

Syntax **loopback** { **local** | **payload** | **remote** }

undo loopback

View CT3 interface view

Parameter **local**: Enables internal loopback on the CT3 interface.

payload: Enables external payload loopback on the CT3 interface.

remote: Enables external loopback on the CT3 interface.

Description Use the **loopback** command to configure the loopback mode for a CT3 interface.

Use the **undo loopback** command to disable loopback.

By default, loopback is disabled on CT3 interfaces.

Loopback is intended for test use. Disable it otherwise.

If a CT3 interface encapsulated with PPP is placed in a loopback, it is normal that the state of the link layer protocol is reported down.

Example # Enable internal loopback on interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] loopback local
```

mdl (CT3 interface view)

Syntax **mdl** { **detect** | **data** { **eic** *string* | **fic** *string* | | **gen-no** *string* | **lic** *string* | **pfi** *string* | **port-no** *string* | **unit** *string* } | **generate** { **idle-signal** | **path** | **test-signal** } }

undo mdl [**detect** | **data** [**eic** | **fic** | **gen-no** | **lic** | **pfi** | **port-no** | **unit**] | **generate** [**idle-signal** | **path** | **test-signal**]]

View CT3 interface view

Parameter **detect**: Enables periodical maintenance data link (MDL) message detection.

data: Sets information included in MDL messages. Among all types of information, EIC, LIC, FIC, and unit are defined for all types of MDL messages; PFI is only for path MDL messages; port number is only for idle signal messages; and generator number is only for test signal messages.

eic *string*: Equipment identification code, a string of 1 to 10 characters. The default EIC is line.

lic *string*: Location identification code, a string of 1 to 11 characters. The default LIC is line.

fic *string*: Frame identification code, a string of 1 to 10 characters. The default FIC is line.

unit *string*: Unit, a string of 1 to 6 characters. The default unit is line.

pfi *string*: Path facility identification, a string in the range 1 to 38 characters. The default PFI is line.

port-no *string*: Port number, a string in the range 1 to 38 characters. The default port number is line.

gen-no *string*: Generator number, a string of 1 to 38 characters. The default generator number is line.

generate: Sends specified information with MDL messages, which can be path, idle signal, and/or test signal regularly.

Description

Use the **mdl** command to configure MDL message detection/sending on the CT3 interface.

Use the **undo mdl** command to remove the MDL settings.

Use the **undo mdl detect** command to disable the CT3 interface to detect MDL messages.

Use the **undo mdl generate** command to disable the CT3 interface to send MDL messages.

Use the **undo mdl data** command to restore the default.

MDL is a channel formed by using the three C-bits in the fifth subframe in C-bit framing. According to ANSI T1.107a, it is used to transmit three types of maintenance messages, path, idle signal, and test signal, and its data frame format is LAPD.

At the startup of your router, MDL message detection and sending are disabled on CT3 interfaces and the default MDL message information applies.

Example

Enable MDL detection on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] mdl detect
```

Set LIC to "hello" for CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] mdl data lic hello
```

Send path messages on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] mdl generate path
```

t1 alarm

Syntax **t1** *line-number* **alarm** { **detect** | **generate** { **ais** | **rai** } }

undo t1 *line-number* **alarm** { **detect** | **generate** { **ais** | **rai** } }

View CT3 interface view

Parameter *line-number*: T1 line number, in the range 1 to 28.

detect: Enables/disables periodical alarm signal detection. By default, periodical alarm detection is enabled.

generate: Sends alarm signals, AIS or RAI, for line state test. By default, alarm signal sending is disabled.

ais: Alarm indication signal.

rai: Remote alarm indication signal.

Description Use the **t1 alarm** command to enable the specified T1 line on the CT3 interface to detect/send alarm signals.

Use the **undo t1 alarm** command to remove the alarm signal detection/sending setting.

At the startup of the router, periodical alarm signal detection is enabled on all T1 lines on the CT3 interface. When a T1 line detects LOS, LOF, or AIS signals, it sends RAI signals to its peer. Alarm state report for the interface is real time; you may view that with the **display controller t3** command.

The supported alarm signals, LOS, LOF, AIS, RAI, FEBE, and idle, are ANSI T1.403 compliant.

You can configure a T1 line to send only a type of alarm signal. To have the channel send another type of signal, use the **undo t1 alarm** command to remove the previous setting first. In addition, when the RAI signal generated upon detection of the LOS, LOF, or AIS signal is present, the T1 line cannot send another type of signal. To do that, use the **undo t1 alarm detect** command to disable the T1 line to send the RAI signal generated after detecting an alarm first.

Example # Enable periodical alarm signal detection on T1 line 1 on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 alarm detect
```

Enable T1 line 1 on CT3 interface T3 2/0 to send AIS alarm signals.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 alarm generate ais
```

t1 bert

Syntax **t1** *line-number* **bert pattern** { **2^11** | **2^15** | **2^20** | **2^23** | **qrss** } **time** *number* [**unframed**]

undo t1 *line-number* **bert**

View CT3 interface view

Parameter *line-number*: T1 line number, in the range 1 to 28.

pattern: Sets a BERT pattern, which could be 2^11, 2^15, 2^20, 2^23, or QRSS.

2^11: Two to the eleventh power, length of the transmitted BERT pattern in bits.

2^15: Two to the fifteenth power, length of the transmitted BERT pattern in bits.

2^20: Two to the twentieth power, length of the transmitted BERT pattern in bits.

2^23: Two to the twenty third power, length of the transmitted BERT pattern in bits.

qrss: Two to the twentieth power, length of the transmitted BERT pattern in bits. In this pattern, the presence of 14 or more consecutive zeros is not allowed.

time *number*: Sets the duration of a BERT test, in the range of 1 to 1440 minutes.

unframed: Sets the test pattern to cover the overhead bits of the frame.

Description Use the **t1 bert** command to start a BERT test on the specified T1 line on the CT3 interface.

Use the **undo t1 bert** command to stop the BERT test running on the specified T1 line on the CT3 interface.

ITU O.151, ITU O.153, and ANSI T1.403-1999 define many BERT patterns, among which, T1 lines on CT3 interfaces support only 2^11, 2^15, 2^20, 2^23, and QRSS at present.

When running a BERT test, the local end sends out a pattern, which is to be looped over somewhere on the line and back to the local end. The local end then

checks the received pattern for the bit error rate, and by so doing helps you determine whether the condition of the line is good. To this end, you must configure loopback to allow the transmitted pattern to loop back from somewhere on the line, for example, from the far-end interface by placing the interface in far-end loopback.

You may view the state and result of the BERT test with the **display controller t3** command.

Example # Run a 10-minute QRSS BERT test on T1 line 1 on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 bert pattern qrss time 10
```

t1 channel-set

Syntax **t1** *line-number* **channel-set** *set-number* **timeslot-list** *list* [**speed** { **56k** | **64k** }]

undo t1 *line-number* **channel-set** *set-number*

View CT3 interface view

Parameter *line-number*: T1 line number in the range 1 to 28.

set-number: Number of a channel set formed from a timeslot bundle on the T1 line. It ranges from 0 to 23.

timeslot-list *list*: Specifies timeslots to be bundled. The *list* argument is timeslot numbers, in the range of 1 to 24. You may specify a single timeslot by specifying a number, a range of timeslots by specifying a range in the form of *number1***-***number2*, or several discrete timeslots by specifying *number1*, *number2***-***number3*.

speed { **56k** | **64k** }: Speed of the timeslot bundle (the channel set) in kbps. If **56k** is selected, the timeslots is bundled into an N × 56 kbps bundle. If **64k**, the default, is selected, the timeslots is bundled into an N × 64 kbps bundle.

Description Use the **t1 channel-set** command to bundle specified timeslots into a channel set on a T1 line.

Use the **undo t1 channel-set** command to remove the specified channel set.

By default, no channel set is created.

When a T1 line is operating in framed (CT1) mode, you can bundle timeslots on it. For each channel set thus formed, the system automatically creates a serial interface numbered **serial** *number***/***line-number***:***set-number*. This interface operates at N × 64 kbps (or N × 56 kbps) and is logically equivalent to a synchronous serial interface on which you can make other configurations.

Related command: **t1 unframed**.

Example # Create a 128 kbps serial interface through timeslot bundling on the first T1 line on interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 channel-set 1 timeslot-list 1,2
```

t1 sendloopcode

Syntax **t1** *line-number* **sendloopcode** { **fdl-ansi-line-up** | **fdl-ansi-payload-up** | **fdl-att-payload-up** | **inband-line-up** }

undo t1 *line-number* **sendloopcode** { **fdl-ansi-line-up** | **fdl-ansi-payload-up** | **fdl-att-payload-up** | **inband-line-up** }

View CT3 interface view

Parameter *line-number*: T1 line number, in the range 1 to 28.

fdl-ansi-line-up: Sends ANSI-compliant LLB activation request code in the FDL to start remote loopback.

fdl-ansi-payload-up: Sends ANSI-compliant PLB activation request code in the FDL to start remote loopback.

fdl-att-payload-up: Sends AT&T-compliant PLB activation request code in the FDL to start remote loopback.

inband-line-up: Sends in-band LLB activation request code compliant with the ANSI and AT&T implementation to start remote loopback.

Description Use the **t1 sendloopcode** command to set the loopback mode of the specified far-end T1 line.

Use the **undo t1 sendloopcode** command to remove the corresponding setting.

Loopback is an effective way of diagnosis. You may place a far-end device into loopback mode either at command line on it or by sending loopback control code to it. The types and formats of loopback control code supported on T1 interfaces are compliant with ANSI T1.403.

Loopback can be divided into line loopback and payload loopback. They differ in the sense that the data stream is looped back at the framer with line loopback but not with payload loopback.

You may transmit loopback control code by using the in-band signal (the 192 effective bandwidth bits or all 193 bits of T1) or the FDL in ESF frames.

Example # Send the in-band signal on T1 line 1 on CT3 interface T3 2/0 to place the far-end T1 line in line loopback mode.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 sendloopcode inband-line-up
```

t1 set clock

Syntax **t1** *line-number* **set clock** { **master** | **slave** }

undo t1 *line-number* **set clock**

View CT3 interface view

Parameter *line-number*: T1 line number in the range 1 to 28.

master: Adopts the internal clock as the clock source on the T1 line.

slave: Adopts the line clock as the clock source on the T1 line.

Description Use the **t1 set clock** command to configure clock source for a T1 line on the CT3 interface.

Use the **undo t1 set clock** command to restore the default, that is, line clock.

When a CT3 interface is working in channelized mode, its T1 lines may use separate clocks.

Example # Use the internal clock as the clock source on the first T1 line on interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 set clock slave
```

t1 set frame-format

Syntax **t1** *line-number* **set frame-format** { **esf** | **sf** }

undo t1 *line-number* **set frame-format**

View CT3 interface view

Parameter *line-number*: T1 line number in the range 1 to 28.

esf: Set the T1 line to use the ESF format.

sf: Set the T1 line to use the SF format.

Description Use the **t1 set frame-format** command to configure the framing format of a T1 line.

Use the **undo t1 set frame-format** command to restore the default, that is, ESF.

You can configure this command only when the T1 line is working in framed format (which can be set by using the **undo t1 unframed** command).

Related command: **t1 unframed**.

Example # Set the framing format to SF for the first T1 line on interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 set frame-format sf
```

t1 set loopback

Syntax **t1** *line-number* **set loopback** { **local** | **remote** | **payload** }

undo t1 *line-number* **set loopback**

View CT3 interface view

Parameter *line-number*: T1 line number in the range 1 to 28.

local: Sets the T1 line in internal loopback mode.

remote: Sets the T1 line in external loopback mode.

remote: Sets the T1 line in payload loopback mode.

Description Use the **t1 set loopback** command to set the loopback mode of a T1 line on the T3 interface.

Use the **undo t1 set loopback** command to disable the T1 line to loop back.

By default, loopback is disabled on T1 lines.

Loopback is intended for test use. Disable it otherwise.

If a T1 line encapsulated with PPP is placed in loopback mode, it is normal that the state of the link layer protocol is reported down.

Example # Enable internal loopback on the first T1 line on interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 set loopback local
```

t1 set fdl

Syntax **t1** *line-number* **set fdl** { **ansi** | **att** | **both** | **none**}

undo t1 *line-number* **set fdl**

View CT3 interface view

Parameter *line-number*: T1 line number, in the range 1 to 28.

fdl: Sets the FDL format of T1.

ansi: Adopts ANSI T1.403 for FDL.

att: Adopts AT&T TR 54016 for FDL.

both: Adopts both ANSI T1.403 and AT&T TR 54016 for FDL.

none: Disables the use of FDL on the T1 line.

Description Use the **t1 set fdl** command to set the behavior of the specified T1 line on the FDL in ESF framing.

Use the **undo t1 set fdl** command to disable FDL of T1.

By default, FDL is disabled.

FDL is an embedded 4 kbps overhead channel within the ESF format for transmitting periodical performance report (PPR) statistics or loopback code.

According to ANSI T1.403, the format of PPR is LAPD, and the format of loopback code is BOP.

The **t1 set fdl** command only starts PPR transmission. It cannot enable loopback code transmission or detection.

These two commands only apply to channelized T1 lines with their T1 frame format being ESF.

Example # Set the FDL to be ANSI T1.403 compliant for T1 line 1 on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 set fdl ansi
```

t1 show

Syntax **t1** *line-number* **show**

View CT3 interface view

Parameter *line-number*: T1 line number, in the range 1 to 28.

show: Displays the physical line state of the specified T1 line.

Description Use the **t1 show** command to have a quick look at the line state of the specified T1 line on the CT3 interface.

Example # Display line state of T1 line 1 on CT3 interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 show
T3 2/0  CT1 1 is up
  Frame-format ESF, clock slave, loopback not set
  FDL Performance Report is disabled
  Transmitter is sending none
  Receiver alarm state is none
  Line loop back deactivate code using inband signal last sent
  BERT state:(stopped, not completed)
    Test pattern: 2^11, Status: Not Sync, Sync Detected: 0
    Time: 0 minute(s), Time past: 0 minute(s)
    Bit errors (since test started): 0 bits
    Bits received (since test started): 0 Kbits
    Bit errors (since latest sync): 0 bits
    Bits received (since latest sync): 0 Kbits
```

Table 22 Description on the fields of the t1 show command

Field	Description
T3 2/0 CT1 1 is up	The state of T1 line 1 on the CT3 interface: up or down
Frame-format ESF	Framing format of T1: ESF or SF
clock slave	Clock source used by the T1 line: slave for the line clock or master for the internal clock
loopback not set	Loopback state or mode: local, remote, payload, or not set.
FDL Performance Report is disabled	Transmission of PPR in the FDL is disabled. You may enable that with the **t1 set fdl ansi** command.
Transmitter is sending RAI	The transmitter of the T1 line is sending RAI signals. When the T1 line receives LOS, LOF, or AIS signals, it sends RAI signals.
Receiver alarm state	The type of alarm signal that the T1 line can receive: LOS, LOF, AIS, or RAI.
Line loop back activate code using inband signal last sent	The loopback code sent last time is in-band LLB activation request code.
BERT state	BERT test state: running, complete, or stopped (not completed)
Test pattern	Test pattern in use, 2^11 in this example; synchronization state, and the number of detected synchronizations
Status	
Sync Detected	
Time	The duration of the BERT test and the time that has elapsed
Time past	
Bit errors (since test started)	Number of bit errors received since the start of the BERT test
Bits received (since test started)	Number of bits received since the start of the BERT test
Bit errors (since latest sync)	Number of bit errors received since the last synchronization
Bits received (since latest sync)	Number of bits received since the last synchronization

t1 shutdown

Syntax **t1** *line-number* **shutdown**

undo t1 *line-number* **shutdown**

View CT3 interface view

Parameter *line-number*: T1 line number in the range 1 to 28.

Description Use the **t1 shutdown** command to shut down a T1 line on the CT3 interface.

Use the **undo t1 shutdown** command to bring up a T1 line.

By default, T1 lines are up.

This command shuts down not only the specified T1 line but also the serial interfaces formed on it. Data transmission and receiving will stop as a result. Likewise, the **undo t1 shutdown** command can bring up all these serial interfaces.

Example # Shut down the first T1 line on interface T3 2/0.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 shutdown
```

t1 unframed

Syntax **t1** *line-number* **unframed**

undo t1 *line-number* **unframed**

View CT3 interface view

Parameter *line-number*: T1 line number in the range 1 to 28.

Description Use the **t1 unframed** command to set a T1 line on the CT3 interface to work in unframed mode (T1 mode).

Use the **undo t1 unframed** command to set the T1 line on the CT3 interface to work in framed mode (CT1 mode).

By default, T1 lines are working in framed mode.

A T1 line in unframed mode does not contain the frame control information; it cannot be divided into timeslots. For it, the system automatically creates a serial interface numbered **serial** *number***/***line-number***:0**. This interface operates at 1544 kbps and is logically equivalent to a synchronous serial interface on which you can make other configurations.

Related command: **t1 channel-set**.

Example # Set the first T1 line on interface T3 2/0 to work in unframed mode.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] t1 1 unframed
```

using (CT3 interface view)

Syntax **using** { **ct3** | **t3** }

View CT3 interface view

Parameter **ct3**: Sets the CT3 interface to operate in channelized mode.

t3: Sets the CT3 interface to operate in unchannelized mode.

Description Use the **using** command to configure the operating mode of a CT3 interface.

Use the **undo using** command to restore the default, that is, channelized mode.

You can configure T1 lines on CT3 interfaces operating in channelized mode only.

When a CT3 interface operates in unchannelized mode, the system automatically creates a serial interface numbered **serial** *number***/0:0** for it. This interface operates at 44.736 Mbps and is logically equivalent to a synchronous serial interface on which you can make other configurations.

Example # Configure interface T3 2/0 to operate in unchannelized mode.

```
<Sysname> system-view
[Sysname] interface t3 2/0
[Sysname-T3 2/0] using t3
```

18 ISDN BRI INTERFACE CONFIGURATION COMMANDS

loopback (ISDN BRI interface view)

Syntax **loopback { b1 | b2 | both }**

undo loopback

View ISDN BRI interface view

Parameter **b1**: Places the B1 channel in external loopback.

b2: Places the B2 channel in external loopback.

both: Places both B1 and B2 channels in external loopback.

Description Use the **loopback** command to sets the B1, B2, or both channels on the ISDN BRI interface in external loopback. This can send data from a line back to the line.

Use the **undo loopback** command to restore the default.

By default, loopback is disabled on ISDN BRI interfaces.

CAUTION: *The modules with loopback-supported ISDN interfaces include 4BS (MIM), and 1BS1BU2BS2BU (SIC). In addition, loopback is also supported by the fixed ISDN interfaces on your router, if there is any.*

Example # Place the B1 and B2 channels on interface BRI 1/0 in external loopback.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] loopback both
```

19 ATM CONFIGURATION COMMANDS

atm class

Syntax **atm class** *atm-class-name*

undo atm class *atm-class-name*

View System view

Parameter *atm-class-name*: Name of ATM class, a string of 1 to 16 characters.

Description Use the **atm class** command to create an ATM class and enter the ATM class view.

Use the **undo atm class** command to delete the specified ATM class.

An ATM class is a group of predefined parameters that can be used for ATM interface or PVC.

Related command: **atm-class**.

Example # Create an ATM class named "main" and enter ATM class view.

```
<Sysname> system-view
[Sysname] atm class main
[Sysname-atm-class-main]
```

atm-class

Syntax **atm-class** *atm-class-name*

undo atm-class

View ATM interface view/PVC view

Parameter *atm-class-name*: Name of ATM class, a string of 1 to 16 characters.

Description Use the **atm-class** command to apply an ATM class to an ATM interface or a PVC.

Use the **undo atm-class** command to remove the ATM class applied to a ATM interface or a PVC.

Related command: **atm class**.

Example # Apply the ATM class named "main" to ATM 1/0 interface.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] atm-class main
```

atm-link check

Syntax **atm-link check**

undo atm-link check

View ATM P2P sub-interface view

Parameter None

Description Use the **atm-link check** command to have the protocol state of the ATM P2P sub-interface change depending on whether the physical interface is up and whether a PVC is configured on the sub-interface. The protocol of the sub-interface, which comes down otherwise, goes up when the physical interface is up and a PVC is configured on the sub-interface.

Use the **undo atm-link check** command to restore the default.

By default, the protocol of the ATM P2P sub-interface goes up or comes down depending on whether the physical interface is up or down.

This command applies only to ATM P2P sub-interfaces.

Example # Enable the protocol state of ATM P2P sub-interface 4/0.1 to change depending on whether the physical interface is up and whether a PVC is configured on the sub-interface.

```
<Sysname> system-view
[Sysname] interface atm 4/0.1 p2p
[Sysname-Atm4/0.1] atm-link check
```

clock

Syntax **clock** { **master** | **slave** }

undo clock

View ATM main interface view

Parameter *master*: Specifies the internal transmission clock.

slave: Specifies the line clock.

Description Use the **clock** command to specify the clock signal to be adopted by an ATM interface.

Use the **undo clock** command to restore the default.

By default, ATM interface uses line clock signal (slave). This clock signal is usually provided by device which provides ATM interfaces.

When two network devices are connected back-to-back through their ATM interfaces, you need to configure one interface to adopt the signal of the internal transmission clock.

The effect of this command applies to both ATM main interface and sub-interface. However, the command is available only in ATM main interface view.

Related command: **display atm interface**.

Example # Specify ATM 1/0 interface to adopt the signal of the internal transmission clock.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] clock master
```

display atm class

Syntax **display atm class** [*atm-class-name*]

View Any view

Parameter *atm-class-name*: ATM class name, a string of 1 to 16 characters.

Description Use the **display atm class** command to display the information about an ATM class.

Note that:

- If you provide the *atm-class-name* argument, this command displays the information about the ATM class identified by the argument.
- If you do not specify the *atm-class-name* argument, this command displays the information about all the ATM classes.

Example # Display the information about the ATM class named "main".

```
<Sysname> display atm class main
ATM CLASS: main
Service ubr 8000
encapsulation aal5snap
```

Table 23 Description on the fields of the display atm class command

Field	Description
ATM CLASS	ATM class name

Table 23 Description on the fields of the display atm class command

Field	Description
Service ubr 8000	The PVC's service type and the bit rate
encapsulation aal5snap	The type of ATM AAL5 encapsulation of the PVC is aal5snap.

display atm interface

Syntax **display atm interface** [**atm** *interface-number*]

View Any view

Parameter *interface-number*: Specifies an ATM interface to view the detailed information about.

Description Use the **display atm interface** command to display detailed information about ATM interface.

Note that:

If you provide the *interface-number* argument, this command displays the information about the ATM interface identified by the argument.

If you do not provide the argument, this command displays the information about all the ATM interfaces.

Example # Display the information about ATM 4/0 interface.

```
<Sysname> display atm interface atm 4/0
ATM interface Atm4/0, State UP
  Port Information:
    Maximum VCs: 1024
    PVCs: 5, MAPs: 1
    input pkts: 11603, input bytes: 426476, input pkt errors: 37092
    output pkts: 14053, output bytes: 519106, output pkt errors: 0
  Main interface Information:
    PVCs: 4, MAPs: 1
    input pkts: 11603, input bytes: 426476, input pkt errors: 19210
    output pkts: 14053, output bytes: 519106, output pkt errors: 0

ATM interface Atm4/0.1, point-to-point, State UP
  Sub-interface Information:
    PVCs: 1, MAPs: 0
    input pkts: 0, input bytes: 0, input pkt errors: 17880
    output pkts: 0, output bytes: 0, output pkt errors: 0
```

Table 24 Description on the fields of the display atm interface command

Field	Description
ATM interface Atm6/0/0, State UP	Name and state of the interface
Maximum VCs	Maximum number of VCs on the ATM interface

Table 24 Description on the fields of the display atm interface command

Field	Description
PVCs	Number of PVCs configured on the interface
MAPs	Number of maps on the interface
input pkts: 0, input bytes: 0, input pkt errors: 0	Received packets, bytes, and errors
output pkts: 69, output bytes: 2218, output pkt errors: 8	Transmitted packets, bytes, and errors

display atm map-info

Syntax **display atm map-info** [**interface** *interface-type interface-number* [**pvc** { *pvc-name* [*vpi/vci*] | *vpi/vci* }]]

View Any view

Parameter *interface-type interface-number*: Specifies an interface by its type and number.

pvc-name: PVC name, a unique string of 1 to 16 characters on ATM interface, not case-sensitive. The name cannot be the same as a valid VPI/VCI value pair. For example, the name 1/20 is not allowed.

vpi/vci: VPI/VCI pair. VPI is short for virtual path identifier; its value ranges from 0 to 255. VCI is short for virtual channel identifier; its value range varies by interface type. Normally, VCI values from 0 to 31 are reserved for special purpose, you are not recommended to use them. For details regarding the value range, refer to Table 28.

Description Use the **display atm map-info** command to view the map information on an ATM interface.

Note that:

- Without an interface specified, the system displays the map information for all ATM interfaces.
- Without specifying the PVC name or the VPI/VCI value pair, the system displays the map information of all PVCs on the specified ATM interface.

Example # Display map information for all ATM interfaces.

```
<Sysname> display atm map-info
Atm1/0, PVC 1/32, PPP, Virtual-Template10, UP
Atm1/0, PVC 1/33, IP & Mask, State UP
100.11.1.1, mask 255.255.0.0, vlink 1
Atm1/0, PVC 2/101, ETH, Virtual-Ethernet1, UP
```

Table 25 Description on the fields of the display atm map-info command

Field	Description
Atm1/0	Interface number
PVC 1/33	PVC identifier

Table 25 Description on the fields of the display atm map-info command

Field	Description
IP & Mask	Protocol type
State UP	Map entry state
100.11.1.1, mask 255.255.0.0	Protocol address
Vlink 1	Virtual link number

display atm pvc-group

Syntax **display atm pvc-group** [**interface** *interface-type interface-number* [**pvc** { *pvc-name* [*vpi/vci*] | *vpi/vci* }]]

View Any view

Parameter *interface-type interface-number*: Interface type and interface number.

pvc-name: PVC name, a unique string of 1 to 16 characters on ATM interface, not case-sensitive. The name cannot be the same as a valid VPI/VCI value pair. For example, the name 1/20 is not allowed.

vpi/vci: VPI/VCI pair. VPI is short for virtual path identifier; its value ranges from 0 to 255. VCI is short for virtual channel identifier; its value range varies by interface type. Normally, VCI values from 0 to 31 are reserved for special purpose, you are not recommended to use them. For details regarding the value range, refer to Table 28.

Description Use the **display atm pvc-group** command to view the information about PVC-Group.

Note that:

- If no interface is specified, the system displays PVC-Group information on all ATM interfaces.
- If the PVC name or the VPI/VCI value pair is not specified, the system displays information of all PVC-Groups on the specified ATM interface.

Example # Display the information about PVC-Group on all ATM interfaces.

```
<Sysname> display atm pvc-group
VPI/VCI   PVC-NAME      STATE ENCAP PROT     INTERFACE         GROUP
1/32           aa       UP    SNAP  IP     Atm11/0(UP)       1/32
1/33                    UP    SNAP  IP     Atm11/0(UP)       1/32
3/34                    UP    SNAP  IP     Atm11/0(UP)       1/32
```

Table 26 Description on the fields of the display atm pvc-group command

Field	Description
VPI/VCI	VPI/VCI value pair
PVC-NAME	PVC name
STATE	PVC state

Table 26 Description on the fields of the display atm pvc-group command

Field	Description
ENCAP	AAL5 encapsulation type of the PVC
PROT	Upper protocol running on the PVC
INTERFACE	Interface to which the PVC belongs
GROUP	PVC group to which the PVC belongs

display atm pvc-info

Syntax **display atm pvc-info** [**interface** *interface-type interface-number* [**pvc** { *pvc-name* [*vpi/vci*] | *vpi/vci* }]]

View Any view

Parameter *interface-type interface-number*: Interface type and number.

pvc-name: PVC name, a unique string of 1 to 16 characters on ATM interface, not case-sensitive. The name cannot be the same as a valid VPI/VCI value pair. For example, the name 1/20 is not allowed.

vpi/vci: VPI/VCI pair. VPI is short for virtual path identifier; its value ranges from 0 to 255. VCI is short for virtual channel identifier; its value range varies by interface type. Normally, VCI values from 0 to 31 are reserved for special purpose, you are not recommended to use them. For details regarding the value range, refer to Table 28.

Description Use the **display atm pvc-info** command to view the information about PVC.

Note that:

- Without an interface specified, the system displays PVC information on all ATM interfaces.
- Without a PVC name or a VPI/VCI value pair specified, the system displays all the PVC information on the specified ATM interface.

Example # Display the PVC information on all ATM interfaces.

```
<Sysname> display atm pvc-info
VPI/VCI | STATE   | PVC-NAME  | INDEX  | ENCAP  | PROT | INTERFACE
--------|---------|-----------|--------|--------|------|----------
1/32    |UP       |aa         |33      |SNAP    |IP    |Atm1/0 (UP)
1/33    |UP       |Sysname    |34      |MUX     |None  |Atm1/0 (UP)
1/55    |UP       |datacomm   |56      |SNAP    |PPP   |Atm1/0.1 (UP)
2/66    |UP       |           |68      |SNAP    |IP    |Atm1/0.4 (UP)
2/101   |UP       |beijing    |103     |SNAP    |ETH   |Atm1/0.2 (UP)
```

Table 27 Description on the fields of the display atm pvc-info command

Field	Description
VPI/VCI	VPI/VCI value pair
STATE	PVC state

Table 27 Description on the fields of the display atm pvc-info command

Field	Description
PVC-NAME	PVC name
INDEX	Internal index of the PVC
ENCAP	AAL5 encapsulation type of the PVC
PROT	Upper protocol running on the PVC
INTERFACE	Interface to which the PVC belongs

encapsulation

Syntax **encapsulation** *aal5-encap*

undo encapsulation

View PVC view/ATM Class view

Parameter *aal5-encap*: AAL5 encapsulation type; its possible values are as follows:

- aal5mux: MUX encapsulation type
- aal5nlpid: RFC1490 encapsulation type
- aal5snap: LLC/SNAP (logical link control/subnet access protocol) encapsulation type

Description Use the **encapsulation** command to specify ATM AAL5 encapsulation type for PVC.

Use the **undo encapsulation** command to restore the default.

By default, aal5snap encapsulation is adopted.

Note that:

- Among aal5snap, aal5mux and aal5nlpid, only aal5snap encapsulation supports InARP.
- If InARP is enabled, you need to disable it before change AAL5 encapsulation to aal5mux or aal5nlpid.
- An ATM PVC can carry multiple protocols simultaneously, but certain types of encapsulations may not support some applications (one or more of IPoA, IPoEoA, PPPoA and PPPoEoA). When such cases occur, the system gives a prompt.

Example # Specify the AAL5 encapsulation of PVC 1/32 on ATM 1/0 interface to aal5snap.

```
<Sysname>system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc 1/32
[Sysname-atm-pvc-Atm1/0-1/32] encapsulation aal5snap
```

interface atm

Syntax **interface atm** { *interface-number* | *interface-number.subnumber* [**p2mp** | **p2p**] }

undo interface atm *interface-number.subnumber*

View System view

Parameter *interface-number*: ATM main interface number.

subnumber: ATM sub-interface number, in the range 0 to 1023.

p2mp: Point-to-multiple point connection on the sub-interface

p2p: Point-to-point connection on the sub-interface

Description Use the **interface atm** command to create an ATM sub-interface or enter an ATM sub-interface view

Use the **undo interface atm** command to delete ATM sub-interface.

Be default, the connection type of sub-interface is p2mp.

Two types of connections are available on ATM sub-interface: p2mp and p2p. In p2mp connection, you can create multiple PVCs on the sub-interface; In p2p connection, you can create just one PVC on the sub-interface.

]Example # Enter Atm1/0 interface.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0]
```

Create and enter sub-interface Atm1/0.1, and set its connection type to p2p.

```
<Sysname> system-view
[Sysname] interface atm 1/0.1 p2p
[Sysname-Atm1/0]
```

ip-precedence

Syntax **ip-precedence** { *pvc-name* [*vpi/vci*] | *vpi/vci* } { *min* [*max*] | **default** }

undo ip-precedence { *pvc-name* [*vpi/vci*] | *vpi/vci* }

View ATM PVC-group view

Parameter *pvc-name*: PVC name, a unique string of 1 to 16 characters on ATM interface, not case-sensitive. The name cannot be the same as a valid VPI/VCI pair value. For example, the name 1/20 is not allowed.

vpi/vci: VPI/VCI pair. VPI is short for virtual path identifier; its value ranges from 0 to 255. VCI is short for virtual channel identifier; its value range varies by interface type. Normally, VCI values from 0 to 31 are reserved for special purpose, you are not recommended to use them. For details regarding the value range, refer to Table 28.

min: Minimum precedence of IP packets carried by the PVC, in the range 0 to 7.

max: Maximum precedence of IP packets carried by the PVC, in the range 0 to 7.

default: Uses the specified PVC as the default PVC.

Description Use the **ip-precedence** command to let different PVCs in PVC-group carry IP packets of different precedence levels.

Use the **undo ip-precedence** command to delete the precedence configuration of IP packets carried over PVC.

- If the **ip-precedence** command is not configured, all IP packets, regardless of their precedence levels, are transmitted over the primary PVC (the one used when the PVC-group is created) in the PVC-group.
- If this command is configured and the **default** keyword is used, which means the current PVC is set as the default PVC, then all the IP packets without specified precedence levels will be transmitted over this PVC.
- If this command is used without using the **default** keyword, which means no PVC is taken as the default PVC, all IP packets without specified precedence levels are transmitted over the primary PVC.
- This command is for configuration of the PVCs in the PVC-Group only. The specified minimum preference *min* should be not greater than the specified maximum preference *max*.

Note that this command does not change the precedence levels of IP packets.

Related command: **pvc-group**, **pvc**.

Example # Configure a PVC named "aa", whose VPI/VCI is 1/32, to carry IP packets with precedence level 0 to 3.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc-group aa 1/32
[Sysname-atm-pvc-group-Atm1/0-1/32-aa] ip-precedence aa 1/32 0 3
```

map bridge

Syntax **map bridge virtual-ethernet** *interface-number*

undo map bridge

View PVC view/ATM Class view

Parameter *interface-number*: Virtual Ethernet (VE) interface number.

Description Use the **map bridge** command to establish the IPoEoA mapping or PPPoEoA mapping on the PVC.

Use the **undo map bridge** command to delete the mapping.

By default, no mapping is configured.

Before using this command, make sure that the VE has been created.

Example The following example demonstrates a complete process of IPoEoA configuration.

Establish a VE interface virtual-Ethernet 1.

```
<Sysname> system-view
[Sysname] interface virtual-ethernet 1
```

Configure an IP address 10.1.1.1/16 for the VE interface.

```
[Sysname-Virtual-Ethernet1] ip address 10.1.1.1 255.255.0.0
[Sysname-Virtual-Ethernet1] quit
```

Create PVC 1/102 on the ATM interface Atm2/0

```
[Sysname] interface atm 2/0
[Sysname-Atm2/0] pvc 1/102
```

Establish the IPoEoA mapping using the established VE interface in PVC view.

```
[Sysname-atm-pvc-Atm2/0-1/102] map bridge virtual-ethernet 1
```

map ip

Syntax In PVC view:

map ip { *ip-address* [*ip-mask*] | **default** | **inarp** [*minutes*] } [**broadcast**]

undo map ip { *ip-address* | **default** | **inarp** }

In ATM class view:

map ip inarp [*minutes*] [**broadcast**]

undo map ip inarp

View PVC view, ATM class view

Parameter *ip-address*: Remote IP address mapped to PVC.

ip-mask: IP address mask. It specifies a network segment together with the *ip-address* argument. This allows the device to forward an IP packet out of the

PVC so long as a next-hop address in the specified network segment is found for the packet.

default: A mapping with the default route property is set. If a packet cannot find a mapping with the same address of next hop at the interface, but one PVC has the default mapping, the packet can be sent over the PVC.

inarp: Enables inverse address resolution protocol (InARP) on PVC.

minutes: Time interval to send InARP packets, in minutes. The value ranges from 1 to 600 and defaults to 15 minutes.

broadcast: Enables pseudo-broadcast. If a map of the PVC is configured with pseudo-broadcast, the device sends on the PVC a copy of each broadcast or multicast packet that it sends out the interface to which the PVC belongs.

You must configure the **broadcast** keyword on an ATM PVC where broadcast or multicast packets must be sent, for example, to allow PIM multicast to create neighbor relationship with the router connected using the ATM interface.

Description Use the **map ip** command to create IPoA mapping for PVC.

Use the **undo map ip** command to delete the mapping.

By default, no mapping is configured. If a mapping is configured, pseudo-broadcast is not supported by default.

Before configuring InARP, make sure the aal5snap encapsulation is used. InARP is not supported when using aal5mux or aal5nlpid encapsulations.

Example # Create a static mapping on PVC 1/32, specifying the opposite IP address to 61.123.30.169 and supporting pseudo-broadcast.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc 1/32
[Sysname-atm-pvc-Atm1/0-1/32] map ip 61.123.30.169 broadcast
```

Enable InARP on PVC 1/33 and send InARP packets every 10 minutes.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc 1/33
[Sysname-atm-pvc-Atm1/0-1/33] map ip inarp 10
```

map ppp

Syntax **map ppp virtual-template** *vt-number*

undo map ppp

View PVC view/ATM Class view

Parameter *vt-number*: Number of the virtual template (VT) interface corresponding to a PPPoA map.

Description Use the **map ppp** command to create a PPPoA map on the PVC.

Use the **undo map ppp** command to delete the map.

By default, no mapping is configured.

Before this command is used, the VT must have already been created.

Example The following example demonstrates a complete process of PPPoA configuration.

Create a VT interface numbered 10, and assign it an IP address.

<Sysname> system-view

```
[Sysname] interface virtual-template 10
[Sysname-Virtual-Template10] ip address 202.38.160.1 255.255.255.0
[Sysname-Virtual-Template10] quit
```

Create PVC 1/101 on interface Atm1/0.

```
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc 1/101
```

Create a PPPoA map using the VT interface created.

```
[Sysname-atm-pvc-Atm1/0-1/101] map ppp virtual-template 10
```

mtu

Syntax **mtu** *mtu-number*

undo mtu

View Interface view

Parameter *mtu-number*: MTU size on ATM interface, in range of 128 to 2000 bytes.

Description Use the **mtu** command to set the size of maximum transmission unit (MTU) on ATM interface.

Use the **undo mtu** command to restore the default.

By default, the MTU of an ATM interface is 1,500 bytes.

The MTU only influences the packet assembly and disassembly at IP layer at the ATM interface. Due to the limit of QoS queue length (for example, the default length of the FIFO queue is 75), MTU which is too small may cause numerous fragments and thus be dropped by the QoS queue. In this case, the length of the QoS queue can be increased appropriately. The default queue dispatching

mechanism used by PVC is FIFO. You can use the **fifo queue-length** command in the PVC view to change its queue length.

The effect of this command applies to ATM main interface and sub-interface simultaneously.

Example # Set the MTU of ATM interface atm 1/0 to 1492 bytes.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] mtu 1492
```

oam ais-rdi

Syntax **oam ais-rdi up** *up-count* **down** *down-count*

undo oam ais-rdi

View PVC view, ATM class view

Parameter *up-count*: Period (in seconds). A PVC goes up if no alarm indication signal/remote defect indication (AIS/RDI) alarm cell is received in the period specified by this argument. The value range of this argument varies with device model.

down-count: Number of AIS/RDI alarm cells. A PVC goes down if the number of the successive AIS/RDI alarm cells received reaches the number specified by this argument. The value range of this argument varies with device model.

Description Use the **oam ais-rdi** command to modify the parameters related to AIS/RDI alarm cell detection.

Use the **undo oam ais-rdi** command to restore the default.

By default, AIS/RDI alarm cell detection is enabled, which means a PVC goes down if the number of successive AIS/RDI alarm cells received reaches that specified by the *down-count* argument, and it goes up if no AIS/RDI alarm cell is received in a period specified by the *up-count* argument.

Note that the **oam ais-rdi** command is not applicable to the secondary PVCs of a PVC group.

- *The primary PVC of a PVC group is the PVC based on which the PVC group is created.*
- *Second PVCs are created in PVC groups.*

Example # Configure the AIS/RDI alarm detection parameters for PVC 1/32, setting both *up-count* and *down-count* to 5.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc 1/32
[Sysname-atm-pvc-Atm1/0-1/32] oam ais-rdi up 5 down 5
```

oam frequency

Syntax **oam frequency** *frequency* [**up** *up-count* **down** *down-count* **retry-frequency** *retry-frequency*]

undo oam frequency

View PVC view/ATM Class view

Parameter *frequency*: Time interval to send operations, administration, and maintenance (OAM) F5 Loopback cells, in seconds, and the range of the value is 1 to 600.

up-count: Number of OAM F5 Loopback cells. A PVC goes up only when the number of the OAM F5 Loopback cells successively and correctly received reaches the number specified by this argument. This argument ranges from 1 to 600. The system default is 3.

down-count: Number of OAM F5 Loopback cells. A PVC goes down only when the number of the successive OAM F5 Loopback cells not received reaches the number specified by this argument. This argument ranges from 1 to 600. The system default is 5.

retry-frequency: Interval (in seconds) to send OAM F5 Loopback cell in retransmission detection before PVC status changes. This argument ranges from 1 to 1,000. The system default is 1.

Description Use the **oam frequency** command to enable the transmission and retransmission detection of OAM F5 Loopback cell, as well as to modify the related parameters.

Use the **undo oam frequency** command to disable the transmission and retransmission detection of the cell.

By default, OAM F5 Loopback cell transmission is disabled, but if an OAM F5 Loopback cell is received, it should be responded.

The **oam frequency** command is not applicable to the secondary PVCs of a PVC group.

Example # Enable OAM F5 Loopback detection on PVC 1/32, with the period of 12 seconds. And set the retransmission detection *up-count* as 4, *down-count* as 4 and retransmission period as 1 second.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc 1/32
[Sysname-atm-pvc-Atm1/0-1/32] oam frequency 12 up 4 down 4 retry-frequency 1
```

oamping interface

Syntax **oamping interface atm** *interface-number* **pvc** { *pvc-name* | *vpi/vci* } [*number timeout*]

View ATM interface view

Parameter **atm** *interface-number*: ATM interface number.

pvc-name: PVC name, a unique string of 1 to 16 characters on ATM interface, not case-sensitive. The name cannot be the same as a valid VPI/VCI pair value. For example, the name 1/20 is not allowed.

vpi/vci: VPI/VCI pair. VPI is short for virtual path identifier; its value ranges from 0 to 255. VCI is short for virtual channel identifier; its value range varies by interface type. Normally, VCI values from 0 to 31 are reserved for special purpose, you are not recommended to use them. For details regarding the value range, refer to Table 28.

number: Number of OAM cells to be transmitted consecutively, in the range 1 to 1,000. The system default is 5.

timeout: OAM response timeout period in seconds, in the range 1 to 30. The system default is 2.

Description Use the **oamping interface** command to send OAM cells over the specified PVC on the specified ATM interface so as to check the link state. If no response is received within the specified time, this means that the link is bad, or too busy that packets are lost.

Example # Check the link state of PVC 1/32 on ATM interface 1/0, sending three cells and setting timeout period to one second.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] oamping interface atm 3/0 pvc 1/32 3 1
  Ping interface Atm3/0,pvc 0/45, with 5 of 53 bytes of ATM OAM F5 end-to-end
cell(s),
  timeout is 1 second(s), press CTRL_C to break
        Receive reply from pvc 1/32: time=1 ms
        Receive reply from pvc 1/32: time=1 ms
        Receive reply from pvc 1/32: time=1 ms
```

pvc

Syntax **pvc** { *pvc-name* [*vpi/vci*] | *vpi/vci* }

undo pvc { *pvc-name* [*vpi/vci*] | *vpi/vci* }

View ATM interface view, PVC-Group view

Parameter *pvc-name*: PVC name, a unique string of 1 to 16 characters on ATM interface, not case-sensitive. The name cannot be the same as a valid VPI/VCI pair value. For example, the name 1/20 is not allowed.

vpi/vci: VPI/VCI pair. VPI is short for virtual path identifier; its value ranges from 0 to 255. VCI is short for virtual channel identifier; its value range varies by interface type. Normally, VCI values from 0 to 31 are reserved for special purpose, you are not recommended to use them. For details regarding the value range, refer to Table 28.

Table 28 VCI range for each type of ATM interface

Interface type	VCI
ADSL	<0-255>
G.SHDSL	<0-255>
ATMOC3	<0-1023>
ATME3	<0-1023>
ATMT3	<0-1023>

- *The vpi and vci argument cannot both be 0.*
- *A PVC in a specific PVC-Group cannot be removed in ATM interface view.*

Description Use the **pvc** command to create a PVC or enter the PVC view on ATM interface, or to add the specified PVC into PVC-Group.

Use the **undo pvc** command to delete the specified PVC.

By default, no PVC is created.

- If you specified the *pvc-name* argument when creating a PVC, you can use the **pvc** *pvc-name* [*vpi/vci*] command to enter the view of that PVC
- You can use either the **undo pvc** *pvc-name* [*vpi/vci*] command or the **undo pvc** *vpi/vci* command to delete that PVC.

The VPI/VCI value of a PVC should be unique at an ATM interface (including the main interface and the sub-interface).

The actual number of PVCs that can be created depends on the **pvc max-number** command.

Related command: **display atm pvc-info**, **pvc max-number**.

Example # Create a PVC named "aa" with the VPI/VCI value of 1/101.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc aa 1/101
```

pvc-group

Syntax **pvc-group** { *pvc-name* [*vpi/vci*] | *vpi/vci* }

undo pvc-group { *pvc-name* [*vpi/vci*] | *vpi/vci* }

View ATM interface view

Parameter *pvc-name*: PVC name, a unique string of 1 to 16 characters on ATM interface, not case-sensitive. The name cannot be the same as a valid VPI/VCI pair value. For example, the name 1/20 is not allowed. The PVC corresponding to *pvc-name* must have already been created.

vpi/vci: VPI/VCI pair. VPI is short for virtual path identifier; its value ranges from 0 to 255. VCI is short for virtual channel identifier; its value range varies by interface type. Normally, values from 0 to 31 are reserved for special purpose, you are not recommended to use them. For details on the value range, refer to "VCI range for each type of ATM interface" on page 307.

Description Use the **pvc-group** command to create a PVC group or enter PVC group view.

Use the **undo pvc-group** command to delete the specified PVC-Group.

In creating a PVC-Group, the *pvc-name* argument or the *vpi/vci* argument defines the primary PVC of the PVC-Group.

Before creating a PVC group, make sure the corresponding PVC exists.

The **encapsulation** command and the oam-related commands are not applicable to secondary PVCs. The configurations corresponding to these commands on the primary PVC of a PVC group apply to all the secondary PVCs in the PVC group.

Related command: **ip-precedence**, **pvc**.

Example # Create a PVC group named "aa", with the primary PVC being the PVC with the VPI/VCI value of 1/32.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc aa 1/32
[Sysname-atm-pvc-group-Atm1/0-1/32-aa] quit
[Sysname-Atm1/0] pvc-group aa 1/32
```

pvc max-number

Syntax **pvc max-number** *max-number*

undo pvc max-number

View ATM interface view

Parameter *max-number*: Maximum number of PVCs allowed. The value range varies by the type of physical interface, as shown in the following table.

Table 29 The maximum number of PVCs supported on different types of ATM interfaces

Interface type	Maximum number	Default
ADSL	1 to 32	32
GSHDSL	1 to 32	32
ATM OC3	1 to 1,024	1,024
ATM25	1 to 256	256
ATME3	1 to 1,024	1,024
ATMT3	1 to 1,024	1,024

Description Use the **pvc max-number** command to set the maximum number of PVCs allowed on an ATM interface.

Use the **undo pvc max-number** command to restore the default.

The maximum number of PVCs allowed varies with interface type.

The maximum number specified in this command is the total number of the PVCs available to both ATM main interface and the sub-interfaces.

The effect of this command applies to both ATM main interface and sub-interface. However, the command itself is available only in ATM main interface view.

Example # Configure Atm 1/0 interface to support up to 1,024 PVCs.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc max-number 1024
```

pvp limit

Syntax **pvp limit** *vpi output-scr*

undo pvp limit *vpi*

View ATM interface view

Parameter *vpi*: Virtual path identifier of ATM network; its value ranges from 0 to 255.

output-scr: Sustainable rate of ATM cell output, in kbps. For its detailed value range, refer to Table 30.

Description Use the **pvp limit** command to set the parameters for VP policing.

Use the **undo pvp limit** command to delete the VP policing.

By default, VP policing is not performed.

When applying VP policing, the parameters of PVC are still valid. Only when the parameters of PVC and VP policing are satisfied, will the packets be transmitted and received. In calculating the traffic, the LLC/SNAP, MUX and NLPID headers are included, but the ATM cell head is not included.

Related command: **pvc**, **service cbr**, **service vbr-nrt**, **service vbr-rt**, **service ubr**.

Example # Set the traffic of VP with vpi 1 to 2M.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvp limit 1 2000
```

service cbr

Syntax **service cbr** *output-pcr* [**cdvt** *cdvt-value*]

View PVC view/ATM Class view

Parameter *output-pcr*: Output peak rate of ATM cell in kbps. The value range of this parameter varies with interface type, as shown in the following table

Table 30 Value ranges of output-pcr

Interface type	Value range of output-pcr
ADSL	64 to 640
G.SHDSL	For two-wire interfaces or four-wire interfaces in two-wire mode: 64 to 2,312
	For four-wire interfaces: 128 to 4,624
ATMOC3	64 to 155,000
ATME3	64 to 34,000
ATMT3	64 to 44,000

cdvt-value: cell delay variation tolerance, in μs. The effective range is 0 to 10,000 and the default is 500 μs. This argument cannot be configured in ATM Class view.

Description Use the **service cbr** command to specify PVC service type as constant bit rate (CBR).

By default, the service type is UBR after creating a PVC.

You can use this command to set the PVC service type and the rate parameter. The newly specified PVC service type will replace the existing service type. You are recommended to create the PVC with larger bandwidth first and then the one with smaller bandwidth. If the creation fails, you can increase the *cdvt-value* and try to create the PVC again. In the command line, the system will prompt you on this, as follows:

```
"fail to set service parameter, please adjust cdvt value"
```

The command is not applicable to ATM E1 interfaces and ATM E3 interfaces.

Related command: **service vbr-nrt**, **service vbr-rt**, **service ubr**.

Example # Create a PVC named "aa", with the VPI/VCI value of 1/101.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc aa 1/101
```

Specify the service type of the PVC as cbr and the peak rate of ATM cell as 50,000 kbps, and the cell delay variation tolerance as 1000 μs.

```
[Sysname-atm-pvc-Atm1/0-1/101-aa] service cbr 50000 cdvt 1000
```

service ubr

Syntax **service ubr** *output-pcr*

View PVC view/ATM Class view

Parameter *output-pcr*: Output peak rate of ATM cell in kbps. For the value ranges of this parameter, see Table 30.

Description Use the **service ubr** command to specify the service type of PVC as unspecified bit rate (UBR) and specify the related rate parameters.

By default, the service type is UBR after creating a PVC.

You can use this command as well as the **service vbr-nrt**, **service vbr-rt** and **service cbr** commands to set the service type and the rate-related parameters of a PVC. A newly configured PVC service type overwrites the existing one.

Related command: **service vbr-nrt**, **service vbr-rt**, and **service cbr**.

Example # Create a PVC named "a" with the VPI/VCI value of 1/101.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] service pvc aa 1/101
```

Specify the service type of the PVC as ubr and the peak cell rate of ATM cell as 100,000 kbps.

```
[Sysname-atm-pvc-Atm1/0-1/101-aa] service ubr 100000
```

service vbr-nrt

Syntax **service vbr-nrt** *output-pcr output-scr output-mbs*

View PVC view/ATM Class view

Parameter *output-pcr*: Peak rate of ATM cell output in kbps. For the value ranges of this parameter, see Table 30.

output-scr: Sustainable rate of ATM cell output in kbps. Its value ranges are the same as those of *output-pcr*.

output-mbs: Maximum burst size for ATM cell output, that is, the maximum number of ATM cells that the output interface can cache. The value ranges from 1 to 512.

Description Use the **service vbr-nrt** command to specify the service type of PVC as variable bit rate-non real time (VBR-NRT) and specify the related rate parameters.

By default, the service type is UBR after creating a PVC.

You can use this command as well as the **service ubr**, **service vbr-rt** and **service cbr** commands to set the service type and rate-related parameters of a PVC. A newly configured PVC service type overwrites the existing one.

Related command: **service ubr**, **service vbr-rt**, and **service cbr**.

Example # Create a PVC named "aa", with the VPI/VCI value of 1/101.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc aa 1/101
```

Specify the service type of the PVC as VBR-NRT and set the peak bit rate of ATM cell to 100,000 kbps, the sustainable bit rate to 50,000 kbps and the maximum burst size to 320 cells.

```
[Sysname-atm-pvc-Atm1/0-1/101-aa] service vbr-nrt 100000 50000 320
```

service vbr-rt

Syntax **service vbr-rt** *output-pcr output-scr output-mbs*

View PVC view/ATM Class view

Parameter *output-pcr*: Peak cell rate of ATM output in kbps. For the value ranges of this parameter, see Table 30.

output-scr: Sustainable cell rate of ATM output in kbps. Its value ranges are the same as those of *output-pcr*.

output-mbs: Maximum burst size of ATM cell output, that is, the maximum cache size of ATM cell output at the interface in cell number. The range of the value is 1 to 512. When it is used in ATM E3 interface, the range of the parameter is 1 to 512.

Description Use the **service vbr-rt** command to set the service type of PVC to Variable Bit Rate - Real Time (VBR-RT) and specify the related rate parameters in the PVC view.

By default, the service type is UBR after creating a PVC.

You can use this command as well as the **service ubr**, **service cbr** and **service vbr-nrt** commands to set the service type and rate-related parameters of a PVC. A newly configured PVC service type overwrites the existing one. This command is not applicable to ATM E1 interfaces.

Related command: **service vbr-nrt**, **service ubr**, and **service cbr**.

Example # Create a PVC named "aa" with the VPI/VCI value of 1/101.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc aa 1/101
```

Specify the service type of the PVC as VBR-RT and set the peak cell rate of ATM to 100,000 kbps, the sustainable cell rate to 50,000 kbps, and the maximum burst size to 320 cells.

```
[Sysname-atm-pvc-Atm1/0-1/101-aa] service vbr-rt 100000 50000 320
```

shutdown

Syntax **shutdown**

undo shutdown

View ATM interface view

Parameters None

Description Use the **shutdown** command to shut down an ATM interface.

Use the **undo shutdown** command to bring up an ATM interface.

By default, an ATM interface is up.

Examples # Shut down ATM 5/0.

```
<Sysname> system-view
[Sysname] interface Atm 5/0
[Sysname-Atm5/0] shutdown
```

Bring up ATM 5/0.

```
<Sysname> system-view
[Sysname] interface Atm 5/0
[Sysname-Atm5/0] undo shutdown
```

transmit-priority

Syntax **transmit-priority** *value*

undo transmit-priority

View PVC view

Parameter *value*: Transmission priority, in the range 0 to 9, the higher value indicating a higher priority.

The priority level for the UBR service ranges from 0 to 4.

The priority level for the VBR-NRT service ranges from 5 to 7.

The priority level for the VBR-RT service ranges from 8 to 9.

Description Use the **transmit-priority** command to assign transmission priority for an ATM PVC associated with the UBR, VBR-T, or VBR-NRT service. At the time of bandwidth allocation, the PVCs with higher priorities take precedence over those with lower priorities.

Use the **undo transmit-priority** command to restore the default transmission priority.

By default, the transmission priority of UBR service, VBR-NRT service, and VBR-RT service are 0, 5, and 8.

If you change the service type of a PVC, the transmission priority of the PVC changes to the default for the current service.

Example # Set the transmission priority of ATM PVC 1/32 to 3.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc 1/32
[Sysname-atm-pvc-Atm1/0-1/32] transmit-priority 3
```

20 DCC CONFIGURATION COMMANDS

*Set all synchronous/asynchronous serial interfaces involved in DCC configuration to work in asynchronous mode with the **physical-mode async** command.*

dialer bundle

Syntax **dialer bundle** *number*

undo dialer bundle

View Dialer interface view

Parameter *number*: Dialer bundle number, in the range 1 to 255.

Description Use the **dialer bundle** command to associate a dialer bundle with a dialer interface in RS-DCC.

Use the **undo dialer bundle** command to remove the association.

By default, dialer interfaces are not associated with any dialer bundle in RS-DCC.

This command applies only to dialer interfaces. In addition, a dialer interface can be associated with only one dialer bundle.

Related command: **dialer bundle-member**.

Example # Associate dialer bundle 3 with interface Dialer1.

```
<Sysname> system-view
[Sysname] interface dialer 1
[Sysname-Dialer1] dialer bundle 3
```

dialer bundle-member

Syntax **dialer bundle-member** *number* [**priority** *priority*]

undo dialer bundle-member *number*

View Dial (physical) interface view

Parameter *number*: Dialer bundle number, in the range 1 to 255.

priority *priority*: Priority of a physical interface in the dialer bundle. The *priority* argument is in the range 1 to 255. The higher the number, the higher the priority. The physical interface with higher priority is used first. The default priority is 1.

Description Use the **dialer bundle-member** command to assign a physical interface to a dialer bundle in RS-DCC.

Use the **undo dialer bundle-member** command to remove a physical interface from a dialer bundle.

By default, a dialer bundle contains no physical interface.

This command applies only to physical interfaces. A physical interface can belong to multiple dialer bundles.

Related command: **dialer bundle**.

Example # Assign interface BRI 1/0 to Dialer bundle 1 and Dialer bundle 2, with a priority of 50 in both.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] dialer bundle-member 1 priority 50
[Sysname-Bri1/0] dialer bundle-member 2 priority 50
```

dialer callback-center

Syntax **dialer callback-center** [**user** | **dial-number**] *

undo dialer callback-center

View Dial interface (physical or dialer) view

Parameter **user**: Sets the callback reference to user mode where DCC identifies which dial string is to be used for placing a return call by looking at the remote username configured in the **dialer route** command.

dial-number: Sets the callback reference to dial number mode, where DCC uses dial strings configured in **service-type ppp callback-number** commands in local user view to place return calls. When placing a return call, it needs to identify the dial string to be used by comparing the remote username obtained in PPP negotiation against the local user database for a match.

Description Use the **dialer callback-center** command to configure the PPP callback reference.

Use the **undo dialer callback-center** command to remove the setting.

By default, no PPP callback reference is configured.

This command is mandatory on the PPP callback server.

With both references configured, the device always attempts to place return calls in the user reference approach and in case failure occurs the dial number reference approach. If the command is configured with neither keyword, it equals the **dialer callback-center user dial-number** command.

Related command: **ppp callback** in *PPP Commands* in *Access Volume*.

Example # Specify the device as the PPP callback server, and set the callback reference to user mode.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] ppp callback server
[Sysname-Serial2/0] dialer callback-center user
[Sysname-Serial2/0] dialer route ip 1.1.1.2 user Sysnameb 8810052
```

Specify the device as the PPP callback server, and set the callback reference to dial number mode.

```
<Sysname> system-view
[Sysname] local-user usera
[Sysname-luser-usera] password simple usera
[Sysname-luser-usera] service-type ppp
[Sysname-luser-usera] service-type ppp callback-number 8810048
[Sysname-luser-usera] quit
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ppp callback server
[Sysname-Serial2/0] dialer callback-center dial-number
```

dialer call-in

Syntax **dialer call-in** *remote-number* [**callback**]

undo dialer call-in *remote-number* [**callback**]

View Dial interface (physical or dialer) view

Parameter *remote-number*: Used for matching ISDN calling numbers. The asterisks (*) represent any characters.

callback: Enables the device to place a return call if an incoming number matches the number specified by the *remote-number* argument.

Description Use the **dialer call-in** command to configure a valid ISDN calling number and with the **callback** keyword to enable callback for the number.

Use the **undo dialer call-in** command to remove the setting.

By default, ISDN callback is disabled.

When receiving an incoming ISDN call, the device with the **dialer call-in** command configured first verifies that the caller is valid before processing the call. If the remote PBX does not provide the calling number, the call is dropped directly.

*On a dial interface (physical or Dialer) configured with the **dialer call-in** command, you need to configure the corresponding **dialer route** command or **dialer number** command, making sure that the dial-number configured in the command is the same as the remote-number configured in the **dialer call-in** command.*

Related command: **dialer callback-center**.

Example # Configure the device to place return calls for ISDN calling number 8810152.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] dialer route ip 100.1.1.2 8810152
[Sysname-Bri1/0] dialer call-in 8810152 callback
```

dialer circular-group

Syntax **dialer circular-group** *number*

undo dialer circular-group

View Dial interface (physical) view

Parameter *number:* Number of dialer circular group, same as the one defined in the **interface dialer** command. It ranges from 0 to 1023.

Description Use the **dialer circular-group** command to assign the physical interface to a dialer circular group in C-DCC approach.

Use the **undo dialer circular-group** command to remove the interface from the dialer circular group.

By default, a dialer circular group does not include any physical interfaces.

In C-DCC, you can assign a physical interface to a dialer interface by assigning it to the dialer circular group associated with the dialer interface. While a physical interface can belong to only one dialer interface, a dialer interface includes all physical interfaces assigned to its associated dialer circular group. When placing a call on the dialer interface, DCC selects the physical interface with higher priority.

Related command: **interface dialer**.

Example # Add interface Serial 2/0 and Serial 2/1 to dialer circular group 1.

```
<Sysname> system-view
[Sysname] interface dialer 1
[Sysname-Dialer1] quit
[Sysname] interface serial 2/0
```

```
[Sysname-Serial2/0] dialer circular-group 1
[Sysname-Serial2/0] quit
[Sysname] interface serial 2/1
[Sysname-Serial2/1] dialer circular-group 1
```

dialer disconnect

Syntax **dialer disconnect** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **dialer disconnect** command to clear the dialup link on an interface or all dialup links if no interface is specified.

Example # Clear the dialup link on interface Dialer0.

```
<Sysname> dialer disconnect interface dialer0
```

dialer enable-circular

Syntax **dialer enable-circular**

undo dialer enable-circular

View Dial interface (physical or dialer) view

Parameter None

Description Use the **dialer enable-circular** command to enable circular dial control center (C-DCC).

Use the **undo dialer enable-circular** command to disable C-DCC.

By default, C-DCC is enabled on ISDN BRI and PRI interfaces but disabled on other interfaces.

You need to enable C-DCC before you can use it.

To use resource-shared DCC (RS-DCC) on a dialer interface, you need to configure the **dialer user** command and the **dialer bundle** command on the dialer interface and assign physical interfaces to the dialer bundle with the **dialer bundle-member** command.

After you disable C-DCC, the system clears all configurations on dial interfaces. To make them recover, you need to shut down and then bring up them by performing the **shutdown** command and then the **undo shutdown** command.

If you perform the **dialer enable-circular** command or its **undo** form on a non-dial interface, do the same on the interface to recover it.

Related command: **dialer circular-group**.

Example # Enable C-DCC on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer enable-circular
```

dialer flow-interval

Syntax **dialer flow-interval** *interval*

undo dialer flow-interval

View System view

Parameter *interval*: Traffic statistics interval, in the range 1 to 1500 seconds.

Description Use the **dialer flow-interval** command to configure the traffic statistics interval for DCC.

Use the **undo dialer flow-interval** command to restore the default.

By default, the traffic statistics interval for DCC is 20 seconds.

This command is only useful for traffic-triggered dial in DCC. For example, when using traffic-triggered MP link bundling with DCC, you may need to configure DCC to send traffic statistics about dialup links at certain intervals to MP.

Related command: **dialer threshold**.

Example # Set traffic statistics interval to three seconds for DCC.

```
<Sysname> system-view
[Sysname] dialer flow-interval 3
```

dialer isdn-leased (physical interface view)

Syntax **dialer isdn-leased** *number*

undo dialer isdn-leased *number*

View Dial interface (Physical interface) view

Parameter *number*: Number of the ISDN B channel for leased line connection. It ranges from 0 to 1 for a BRI interface, and 0 to 30 (with 15 excluded for the control channel)

for a PRI interface, and 0 to 23 (with 23 excluded for the control channel) for a CT1/PRI interface.

Description Use the **dialer isdn-leased** command to configure an ISDN B channel for leased line connection.

Use the **undo dialer isdn-leased** command to remove the configuration.

By default, no ISDN B channel is configured to be leased line.

You may use any ISDN B channel for leased line connection without affecting other B channel settings.

On ISDN BRI interfaces, you may also configure ISDN BRI 128 kbps leased line. For more information, refer to the ***"dialer isdn-leased (ISDN BRI interface view)" on page 563****.*

Example # Configure the first B channel on interface BRI 2/0 as a leased line.

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname-Bri2/0] dialer isdn-leased 0
```

dialer number

Syntax **dialer number** *dial-number*

undo dialer number

View Dial interface (physical or dialer) view

Parameter *dial-number:* Dial string for calling a remote end, a string of 1 to 30 characters.

Description Use the **dialer number** command to configure a dial number for placing calls to a single remote end.

Use the **undo dialer number** command to remove the configured dial string.

By default, no dial number is configured for calling the remote end.

You need to configure this command when the dialer or physical dial interface is the calling party.

In C-DCC, you may also use the **dialer route** command to configure multiple destination addresses or dial strings. In RS-DCC, however, you can only use the **dialer number** command to configure one dial string for each dialer interface, because associations between dialer interfaces and call destination address are one-to-one.

If no ***dialer-group*** *command is configured, DCC will not dial even if* ***dialer number*** *command is configured.*

Related command: **dialer route**.

Example # Set the dial string for placing calls to 11111 on interface Dialer1.

```
<Sysname> system-view
[Sysname] interface dialer 1
[Sysname-Dialer1] dialer number 11111
```

dialer priority

Syntax **dialer priority** *priority*

undo dialer priority

View Dial interface (physical) view

Parameter *priority*: Priority of the physical interface in a dialer circular group, in the range 1 to 127.

Description Use the **dialer priority** command to assign a priority to the physical interface in its dialer circular group in C-DCC approach.

Use the **undo dialer priority** command to restore the default.

By default, the priority of a physical interface in its dialer circular group is 1.

This command sets the order in which the available physical interfaces in a dialer circular group are used. The physical interface with higher priority is used first.

Related command: **dialer circular-group**.

Example # Set the priority of interface Serial 2/0 in dialer circular group 0 to 5.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer circular-group 1
[Sysname-Serial2/0] dialer priority 5
```

dialer queue-length

Syntax **dialer queue-length** *packets*

undo dialer queue-length

View Dial interface (physical or dialer) view

Parameter *packets*: Number of packets that can be buffered on the interface, in the range 1 to 100.

Description Use the **dialer queue-length** command to set the buffer queue length on the dial interface.

Use the **undo dialer queue-length** command to restore the default.

By default, no packets are buffered.

If no connection is available yet when a dial interface without a buffer queue receives a packet, it will drop the packet. Configured with a buffer queue, the dial interface will buffer the packet until a connection is available for packet sending.

Example # Set the buffer queue length to 10 on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer queue-length 10
```

dialer route

Syntax **dialer route** *protocol next-hop-address* [**mask** *network-mask-length*] [**broadcast** | **user** *hostname*] * [*dial-number*] [**autodial** | **interface** *interface-type interface-number*] *

undo dialer route *protocol next-hop-address* [**user** *hostname*] [**mask** *network-mask-length*] [*dial-number*] [**interface** *interface-type interface-number*]

View Dial interface (physical or dialer) view

Parameter *protocol*: Network protocol. At present, it can be **ip** only.

next-hop-address: IP address of dialed destination.

mask *network-mask-length*: Optional, mask length of the IP address of the dialed destination, in the range 0 to 32. If no mask length is specified, the default, 32, applies, where the *next-hop-address* argument is handled as a host address. If you want to set the *next-hop-address* argument to a network address, you must specify its mask length. Setting the *next-hop-address* argument to 0.0.0.0 and the *network-mask-length* argument to 0 indicates any next hop address. For example, the **dialer route ip 0.0.0.0 mask 0 8886** command indicates that you may call any IP address by dialing 8886.

user *hostname*: Remote username, a string of 1 to 80 characters used for authentication on incoming calls.

broadcast: Enables broadcast packets to pass through the link.

dial-number: Dial string for calling the remote end, a string of 1 to 30 characters.

autodial: If this keyword is used in a dialer route, you device will automatically attempt to dial according to the dialer route at certain intervals. The interval is set in the **dialer autodial-interval** command and defaults to 300 seconds.

interface *interface-type interface-number*: Specifies to dial from the specified physical interface. When multiple physical interfaces are assigned to a dialer interface and their dialup links are connected to different ISDN switches, you need to associate the dialup numbers with the physical interfaces. This configuration is intended for dialer interfaces in C-DCC only.

Description Use the **dialer route** command to enable a DCC interface to call the specified destination address (host or network address) or to receive calls from multiple remote ends.

Use the **undo dialer route** command to remove a dialer route.

To enable DCC to originate calls, you need to configure the *dial-number* argument.

If the **user** keyword is used, PPP authentication must be configured.

You may configure multiple dialer routes on a dial interface or for a destination address for the backup purpose.

*If the **dialer-group** command is not configured, DCC will not dial.*

Example # Dial 888066 to set up link for packets destined to network 192.168.1.0/24.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer route ip 192.168.1.0 mask 24 888066
```

Dial 888065 to set up link for packets destined to host address 192.168.1.1.

```
[Sysname-Serial2/0] dialer route ip 191.168.1.1 888065
```

dialer threshold

Syntax **dialer threshold** *traffic-percentage* [**in** | **in-out** | **out**]

undo dialer threshold

View Dialer interface view

Parameter *traffic-percentage*: Percentage of actual traffic on the link to bandwidth, in the range 0 to 99.

in: Considers only inbound traffic in actual load calculation.

in-out: Considers either inbound traffic or outbound traffic in actual load calculation, whichever is greater.

out: Considers only outbound traffic in actual load calculation.

Description Use the **dialer threshold** command to set the traffic threshold of a single link on the dialer interface. When the percentage of the traffic on the link to available bandwidth exceeds the threshold, another link is brought up to call the same destination address.

Use the **undo dialer threshold** command to restore the default.

By default, MP flow control is not enabled.

In DCC applications, you may configure load thresholds for links.

If you set a link load threshold in the range 1 to 99, MP tunes allocated bandwidth according to actual traffic percentage as follows:

- When the percentage of traffic on a link to bandwidth exceeds the defined traffic threshold, the system automatically brings up the second link, and assigns them to one MP bundle. When the percentage of traffic on these two links to bandwidth exceeds the defined traffic threshold, the system brings up the third link, and assigns it to the MP bundle, so on and so forth. This ensures appropriate traffic distribution on DCC links.
- On the contrary, when the percentage of the traffic on N (which is an integer greater than 2) links to the bandwidth of N - 1 links decreases under the defined traffic threshold, the system automatically shuts down a link, so on and so forth. This ensures the efficient use of DCC links.

If you set the link load threshold to zero, DCC brings up all available links when triggered by auto-dial or packets instead of looking at traffic size before doing that. In addition, the **dialer threshold 0** command voids the **dialer timer idle** command. DCC does not tear down links that has been established for timeout.

This command must be used in conjunction with the **ppp mp** command. To implement MP with DCC, you must use dialer interfaces.

Related command: **dialer flow-interval**.

Example # Set the link traffic threshold on interface Dialer1 to 80%.

```
<Sysname> system-view
[Sysname] interface dialer 1
[Sysname-Dialer1] dialer threshold 80
```

dialer timer autodial

Syntax **dialer timer autodial** *seconds*

undo dialer timer autodial

View Dial interface (physical or dialer) view

Parameter *seconds*: Interval before the next call attempt, in the range 1 to 604800 in seconds. The default interval is 300 seconds.

Description Use the **dialer timer autodial** command to set the auto-dial timer of DCC.

Use the **undo dialer timer autodial** command to restore the default.

By default, the auto-dial timer of DCC is 300 seconds.

This command takes effect only when the **auto-dial** keyword is configured in the **dialer route** command. It allows DCC to automatically dial at certain intervals to set up a connection. In the auto-dial approach, dial attempts to set up connection are not traffic triggered; once a connection is set up, it will not disconnect for idle-timeout. The use of auto-dial thus voids the **dialer timer idle** command.

Related command: **dialer route**.

Example # Set the auto-dial interval of DCC to 60 seconds on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer timer autodial 60
```

dialer timer compete

Syntax **dialer timer compete** *seconds*

undo dialer timer compete

View Dial interface (physical or dialer) view

Parameter *seconds*: Idle interval when contention occurs, in the range 0 to 65535 seconds.

Description Use the **dialer timer compete** command to set the compete-idle timer.

Use the **undo dialer timer compete** command to restore the default.

By default, the compete-idle timer is 20 seconds.

If all the channels are unavailable when DCC originates a new call, contention occurs.

Normally, an idle-timeout timer starts upon setup of a link. If a call to another destination address is placed at the same time, contention occurs. In this case, DCC starts a compete-idle timer to replace the idle-timeout timer for the link. When the idle time of the link reaches the setting of this compete-idle timer, the link disconnects.

Example # Set the compete-idle timer to 10 seconds on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer timer compete 10
```

dialer timer enable

Syntax **dialer timer enable** *seconds*

undo dialer timer enable

View Dial interface (physical or dialer) view

Parameter *seconds*: Holddown timer value, setting the interval for originating a call to bring up a link after it is disconnected. It ranges from 5 to 65535 seconds.

Description Use the **dialer timer enable** command to set the link holddown timer.

Use the **undo dialer timer enable** command to restore the default.

By default the link holddown timer is five seconds

A holddown timer starts upon disconnection of a link. The call attempt to bring up this link can be made only after the timer expires. This is to prevent a remote PBX from being overloaded.

To leave enough time for a server to call back, the interval between two calls on the client need to be at least 10 seconds longer than that of the server. It is recommended that the interval on the server be set to 5 seconds (the default) and that on the client be set to 15 seconds.

Example # Set the interval for DCC to make the next call attempt to 15 seconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer timer enable 15
```

dialer timer idle

Syntax **dialer timer idle** *seconds*

undo dialer timer idle

View Dial interface (physical or dialer) view

Parameter *seconds*: Link idle-timeout timer, setting the time that a link is allowed to be idle. It ranges from 0 to 65535 seconds.

Description Use the **dialer timer idle** command to set the link idle-timeout timer.

Use the **undo dialer timer idle** command to restore the default.

By default the link idle-timeout timer is 120 seconds

A link idle-timeout timer starts upon setup of a link. If no interesting packets are present before the timer expires, DCC disconnects the link.

If the timer is set to 0, the link will never be disconnected, regardless of whether there are interesting packets on the link or not.

Example # Set the link idle-timeout timer to 50 seconds on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer timer idle 50
```

dialer timer wait-carrier

Syntax **dialer timer wait-carrier** *seconds*

undo dialer timer wait-carrier

View Dial interface (physical or dialer) view

Parameter *seconds*: Wait-carrier timer value, setting the time waiting for call setup. This argument ranges from 0 to 65,535 (in seconds).

Description Use the **dialer timer wait-carrier** command to set the wait-carrier timer.

Use the **undo dialer timer wait-carrier** command to restore the default.

The wait-carrier timer defaults to 60 seconds.

Sometimes, the time that DCC waits for a connection to be established may vary call by call. To handle this situation, you may use a wait-carrier timer. A wait-carrier timer starts when a call is placed. If the connection is not established upon expiration of the timer, DCC terminates the call.

Example # Set the wait-carrier timer to 100 seconds on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer timer wait-carrier 100
```

dialer user

Syntax **dialer user** *username*

undo dialer user

View Dialer interface view

Parameter *username*: Remote username for PPP authentication, a string of 1 to 80 characters.

Description Use the **dialer user** command to add a remote username for authenticating incoming calls.

Use the **undo dialer user** command to remove the remote username.

By default, no remote username is set.

This command is only valid on dialer interfaces in RS-DCC.

On a dialer interface encapsulated with PPP, DCC identifies which dialer interface is to be used for receiving calls based on the remote username obtained through PPP authentication.

You may configure multiple dialer users (up to 255) on a dialer interface. This allows DCC to provide accesses to multiple dial interfaces by using one dialer interface.

Use this command on a C-DCC enabled dialer interface with caution. It enables RS-DCC and can remove the C-DCC configurations on the interface.

Performing the **undo dialer user** command on a dialer interface can clear all configurations on it.

Related command: **ppp pap local-user** on page 522 and **ppp chap user** on page 511.

Example # Add a remote username routerb.

```
<Sysname> system-view
[Sysname] interface dialer 1
[Sysname-Dialer1] dialer user routerb
```

dialer-group

Syntax **dialer-group** *group-number*

undo dialer-group

View Dial interface (physical or dialer) view

Parameter *group-number*: Number of a dialer access group, in the range 1 to 255. You may define it with the **dialer-rule** command.

Description Use the **dialer-group** command to assign the interface to a dialer access group.

Use the **undo dialer-group** command to remove the interface from the dialer access group.

A DCC dial interface can belong to only one dialer access group. Configuring this command can overwrite the previous dialer access group setting for the interface, if any.

*In the default configuration of the interface, the **dialer-group** command is not configured. You must configure this command for DCC to send packets.*

Related command: **dialer-rule**.

Example # Add interface Serial 2/0 to dialer access group 1.

```
<Sysname> system-view
[Sysname] dialer-rule 1 acl 3101
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer-group 1
```

dialer-rule

Syntax **dialer-rule** *group-number* { *protocol-name* { **deny** | **permit** } | **acl** *acl-number* | **name** *acl-name* }

undo dialer-rule *group-number*

View System view

Parameter *group-number*: Number of a dialer access group, same as the *group-number* argument in the **dialer-group** command. It ranges from 1 to 255.

protocol-name: Network protocol, which can take **ip** or **ipx**.

deny: Denies packets of the specified protocol.

permit: Permits packets of the specified protocol.

acl *acl-number*: Specifies an ACL by its ACL number. The *acl-number* argument ranges from 2000 to 3999. An ACL number in the range 2000 to 2999 identifies a basic ACL; an ACL number in the range 3000 to 3999 identifies an advanced ACL.

name *acl-name*: Specifies an ACL by its name.

Description Use the **dialer-rule** command to set the condition for a DCC call to be placed for a dialer access group either by directly configuring a rule or by referencing an ACL.

Use the **undo dialer-rule** command to remove the setting.

You may configure a dial ACL to filter traffic that traverses a dial interface. Packets fall into two categories, depending on whether they are in compliance with the permit or deny statements in the dial ACL.

- Packets that match a permit statement or that do not match any deny statements. When receiving such a packet, DCC either sends it out if a link is present and resets the idle-timeout timer or originates a new call to set up a link if no link is present.
- Packets that do not match any permit statements or that match a deny statement. When receiving such a packet, DCC either sends it out without

resetting the idle-timeout timer if a link is present, or drops it without originating calls for link setup if no link is present.

For DCC to send packets normally, you must configure a dial ACL and associate it with the concerned dial interface (physical or dialer) by using the **dialer-group** command.

If no dial ACL is configured for the dialer access group associated with a dial interface, DCC will drop received packets on the interface as uninteresting ones.

Related command: **dialer-group**.

Example # Configure Dialer-rule1 and associate it with interface Serial 2/0.

```
<Sysname> system-view
[Sysname] dialer-rule 1 ip permit
[Sysname] interface serial 2/0
[Sysname-Serial2/0] dialer-group 1
```

display dialer

Syntax **display dialer** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display dialer** command to display information about the specified or all DCC dial interfaces.

Example # Display information about all DCC dial interfaces.

```
<Sysname> display dialer
Dialer0 - dialer type = Dialer
   Dialer Route:
   NextHop_address          Dialer_Numbers
   Dialer number            003
   Dialer Timers(Secs):
   Autodial:300    Compete:20    Enable:5
   Idle:120    Wait-for-Carrier:60
   Total Channels:1  Free Channels:1
```

Table 31 Description on the fields of the display dialer command

Field	Description
dialer type	Type of dial interface, dialer or physical
NextHop address	Remote address associated with a dialer route on the interface
Dialer Number	Dial string for the remote IP address
Dialer Timers(Secs)	DCC timers
Auto-dial	Timer set by the **dialer timer autodial** command
Compete	Timer set by the **dialer timer compete** command

Table 31 Description on the fields of the display dialer command

Field	Description
Enable	Timer set by the **dialer timer enable** command
Idle	Timer set by the **dialer timer idle** command
Wait-for-carrier	Timer set by the **dialer timer wait-carrier** command
Total Channels	Total number of channels on the interface
Free Channels	Number of free channels

display interface dialer

Syntax **display interface dialer** [*number*]

View Any view

Parameters *number* : Dialer interface number.

Description Use the **display interface dialer** command to display the information about a dialer interface. If you do not provide this argument, this command displays the information about all the dialer interfaces.

Examples # Display the information about all the dialer interfaces.

```
<H3C> display interface dialer
Dialer1 current state: UP
Line protocol current state: UP (spoofing)
Description: Dialer1 Interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)
Internet protocol processing : disabled
Link layer protocol is PPP
LCP initial
Physical is Dialer, baudrate: 64000 bps
Output queue : (Urgent queuing : Size/Length/Discards)  0/50/0
Output queue : (Protocol queuing : Length)  0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
Last 300 seconds input:  0 bytes/sec 0 packets/sec
Last 300 seconds output:  0 bytes/sec 0 packets/sec
     0 packets input, 0 bytes, 0 drops
     0 packets output, 0 bytes, 0 drops
```

Table 32 Description on the fields of the display interface dialer command

Field	Description
current state	Physical state of a dialer interface (up/down)
Line protocol current state	Data link layer protocol state of the dialer interface (up/down)
Description	Interface description
The Maximum Transmit Unit	MTU of the dialer interface
Internet protocol processing	Network layer protocol state of the dialer interface (enabled/disabled)
Link layer protocol is PPP	Current data link layer protocol

Table 32 Description on the fields of the display interface dialer command

Field	Description
LCP initial	LCP is initialized.
Physical is Dialer	The physical interface is a dialer interface.
Output queue : (Urgent queuing : Size/Length/Discards)	Statistics on the packets in the urgent output queue
Output queue : (Protocol queuing : Length)	Statistics on the packets in the protocol output queue
Output queue : (FIFO queuing : Size/Length/Discards)	Statistics on the packets in the FIFO output queue
Last 300 seconds input: 0 bytes/sec, 0 packets/sec	Input interface data rate during the latest 300 seconds
Last 300 seconds output: 0 bytes/sec, 0 packets/sec	Output interface data rate during the latest 300 seconds
0 packets input, 0 bytes, 0 drops	Statistics on the packets reaching the interface
0 packets output, 0 bytes, 0 drops	Statistics on the packets sent through the interface

interface dialer

Syntax **interface dialer** *number*

undo interface dialer *number*

View System view

Parameter *number*: Dialer interface number, in the range 0 to 1023.

Description Use the **interface dialer** command to create a dialer interface. In C-DCC, this equals creating a dialer circular group.

Use the **undo interface dialer** command to remove a dialer interface.

By default, no dialer interface is created.

The dialer interface has a fixed baudrate of 64,000 bps.

In C-DCC, you may assign multiple physical interfaces to a dialer interface to inherit the attributes of this dialer interface by assigning them to the dialer circular group for the dialer interface with the **dialer circular-group** command. This is efficient where calling multiple destinations simultaneously is desired, because instead of configuring individual physical interfaces, you only need to configure multiple dialer routes on the dialer interface.

In RS-DCC, any dialer interface can use the services provided by multiple physical interfaces, and individual physical interfaces can provide services for multiple dialer interfaces at the same time. Therefore, authentication must be configured on these physical interfaces, so as to use the username of a dial-in party to locate the corresponding dialer interface for the call. In this mode, physical interfaces and dialer interfaces are dynamically bound. Furthermore, a dialer interface can only call a destination address as specified in the **dialer number** command.

The physical interfaces in C-DCC and Resource-Shared DCC do not use individual network addresses. Instead, they use the addresses of the corresponding dialer interfaces.

In both C-DCC and RS-DCC, physical interfaces use the network addresses of their associated dialer interface rather than being assigned separate addresses.

Example # Create dialer interface Dialer1.

```
<Sysname> system-view
[Sysname] interface dialer 1
```

ppp callback

Syntax **ppp callback** { **client** | **server** }

undo ppp callback { **client** | **server** }

View Dial interface (physical or dialer) view

Parameter **client**: Sends callback requests as the PPP callback client.

server: Accepts callback requests as the PPP callback server.

Description Use the **ppp callback** command to specify the interface as the server or client to send or accept PPP callback requests.

Use the **undo ppp callback** command to disable the interface as the PPP callback server or client.

By default, callback is disabled.

PPP callback adopts the client/server model where the calling party is the callback client and the called party is the callback server. The client first originates a call, and the server decides whether to originate a return call. If a return call is needed, the callback server disconnects and then originates a return call according to the information such as username or callback number.

This is useful for saving cost in the case that the call rates in two directions are different.

Example # Configure interface Serial 2/0 as the PPP callback server to accept callback requests.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ppp callback server
```

ppp callback ntstring

Syntax **ppp callback ntstring** *dial-number*

undo ppp callback ntstring

View Dial interface (physical or dialer) view

Parameter *dial-number*: Dial string for a Windows NT server to place return calls to your router, a string of 1 to 64 characters.

Description Use the **ppp callback ntstring** command to configure the dial number required for a Windows NT server to place return calls to your router.

Use the **undo ppp callback ntstring** command to remove the dial string.

By default, no callback dial string is configured for any Windows NT server.

When your router is functioning as a PPP callback client, configure this command if a Windows NT Server requires PPP callback clients to send callback numbers.

Related command: **ppp callback**.

Example # Set the dial string for a Windows NT server to call back the router to 1234567.

```
<Sysname> system-view
[Sysname] interface dialer 1
[Sysname-Dialer1] ppp callback ntstring 1234567
```

21 BASIC DLSW CONFIGURATION COMMANDS

code nrzi

Syntax **code nrzi**

undo code

View Synchronous serial interface view

Parameter None

Description Use the **code nrzi** command to configure the synchronous serial interface to use NRZI encoding.

Use the **undo code** command to configure the synchronous serial interface to use NRZ encoding.

By default, the NRZ encoding scheme is used on the synchronous serial interface.

There are two encoding schemes, NRZI and NRZ, for synchronous serial interface. The NRZ encoding scheme is generally used for synchronous serial interfaces of routers. The serial interfaces of some SNA devices, however, use NRZI encoding. Therefore, the encoding scheme of routers should be changed according to the encoding schemes used on the connected devices.

Example # Configure Serial 1/0 to use NRZI encoding.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] code nrzi
```

display dlsw circuits

Syntax **display dlsw circuits** [*circuit-id*] [**verbose**]

View Any view

Parameter *circuit-id*: Specifies the ID of a DLSw virtual circuit, in the range of 0 to 0xFFFFFFFF.

verbose: Displays the detailed information of the virtual circuits.

Description Use the **display dlsw circuits** command to view the DLSw virtual circuit information.

The output information of the command helps the user understand the condition of DLSw virtual circuits.

Example # Display the information of all virtual circuits.

```
<Sysname> display dlsw circuits
circuit-Id  port    local-MAC       remote-MAC      state       lifetime
00a2000a      04        0000.1738.6dfd  0000.1722.3435  CONNECTED   10:02:23
```

Table 33 Description on the fields of the display dlsw circuits command

Field	Description
circuit-Id	Virtual circuit ID
port	Port number used for TCP connection
local-MAC	The MAC address of the local peer across the virtual circuit
remote-MAC	The MAC address of the remote peer across the virtual circuit
State	Connection status. ■ CONNECTED: a TCP connection has been established ■ DISCONNECTED: no TCP connection has been established ■ CONNECTING: a TCP connection is being established
lifetime	The length of time for which the virtual circuit has been up

display dlsw information

Syntax **display dlsw information** [**local** | *ip-address*]

View Any view

Parameter **local**: Displays the local information about capabilities exchange.

ip-address: Specifies the IP address of the remote peer to display the capabilities exchange information about.

Description Use the **display dlsw information** command to display the DLSw capabilities exchange information.

The output information of the command helps the user to understand the condition of a DLSw virtual circuit.

Example # Display DLSw capabilities exchange information.

```
DLSw: Capabilities of local: 1.1.1.1   Vendor ID (OUI): 00.16.e0
  Version number       : 2         Release number      : 0
  Initial Pacing Window: 40        TCP sessions number : 1
  Multicast address    : None
  Version string       : 3Com OS software, Version 5.00c01 (Extended
), Release 1205, Standard
Copyright(c) 2004-2007 3Com Corporation and its licensors, All right
s reserved.
```

Table 34 Description on the fields of the display dlsw information command

Field	Description
DLSw	The IP address of the remote peer
Vendor ID(OUI)	The vendor ID of the remote device
Version number	The latest DLSw version currently supported by the remote device
Release number	Release version
Initial pacing window	Size of the initialized window
TCP sessions number	Number of TCP sessions
Multicast address	Multicast IP address configured on the remote device
Version string	Operating system version information of the remote peer

Display the local information about capabilities exchange.

```
DLSw: Capabilities of local: 1.1.1.1   Vendor ID (OUI): 00.0f.e2
  Version number       : 2         Release number      : 0
  Initial Pacing Window: 40        TCP sessions number : 1
  Multicast address    : None
  Version string       : Comware software, Version 5.20, Release 1205, Standard
  Copyright (c) 2004-2007 Hangzhou H3C Tech. Co., Ltd. All rights reserved.
```

display dlsw remote

Syntax **display dlsw remote** [*ip-address*]

View Any view

Parameter *ip-address*: Specifies the IP address of the remote peer to display the information about.

Description Use the **display dlsw remote** command to display the information of a remote peer or all remote peers.

With the *ip-address* argument provided, this command displays the information the specified remote DLSw peer; without the *ip-address* argument provided, this command displays the information all remote DLSw peers.

Example # Display information about all the current remote peers.

```
<Sysname> display dlsw remote
Remote peer type: D--Learning Dynamic
                  C--Configured by user
Total peers number:5
IP Address    frame-in  frame-out frame-drop  port  type  state
lifetime
*128.10.45.10     0          0          0         2065  C   CONNECT
00:00:00
128.10.46.78      2          2          0         2065  C   DISCONNECT
00:00:00
*130.20.45.12     2          2          0         2067      D   CONNECT
00:02:00
130.35.46.77      0          0          0         2067      C   DISCONNECT
00:00:00
```

```
*145.11.23.58     2          1          1         2067      C   CONNECTING
00:00:00
```

Table 35 Description on the fields of the display dlsw remote command

Field	Description
Remote peer type	Type of the remote peer ■ D: the remote peer was dynamically learned ■ C: the remote peer was manually configured
Total peers number	Total number of remote peers
IP address	Remote peer IP address (if preceded by a *, this remote peer can establish a connection; otherwise, this remote peer is inactive and only serves as a backup)
frame-in	Number of frames the local peer has received from this remote peer
frame-out	Number of frames the local peer has sent to this remote peer
frame-drop	Number of frames dropped due to errors while the local peer sent/received frames to/from this remote peer
port	Port number for the TCP connection ■ 2065: DLSw v1.0 ■ 2067: DLSw v2.0
type	Type of the remote peer
state	Status of the connection: ■ CONNECT: a TCP connection has been established ■ DISCONNECT: no TCP connection has been established ■ CONNECTING: a TCP connection is being established
lifetime	Length of time for which the connection has been up

display dlsw reachable-cache

Syntax **display dlsw reachable-cache**

View Any view

Parameter None

Description Use the **display dlsw reachable-cache** command to view the reachability information of DLSw.

Example # Display the reachability information of DLSw.

```
<Sysname> display dlsw reachable-cache
LOCAL MAC addresses in cache
------------------------------------------------------------------------
 MAC address       Status           Interface            Remain time

REMOTE MAC addresses in cache
------------------------------------------------------------------------
MAC address       Status          Peer       Type       Remain time
0102-2103-5641    FOUND           2.2.2.2    DYNAMIC    15
6500-7201-8160    FOUND           1.1.1.1    CONFIG     15
```

Table 36 Description on the fields of the display dlsw reachable-cache command

Field	Description
LOCAL MAC addresses in cache	Display the saved local reachability information
MAC address	MAC address of the terminal that is reachable to the local peer
Status	Status of the reachability information
Interface	The interface through which information destined to the MAC address will be sent
Remain time	Remaining aging time
REMOTE MAC addresses in cache	Display the saved remote reachability information
MAC address	MAC address of the terminal that is reachable to the remote peer
Status	Status of the reachability information
Peer	The remote peer to which the reachability information belongs
Type	Type of the reachability information ■ DYNAMIC: the information was dynamically learned ■ CONFIG: the information was manually configured
Remain time	Remaining aging time

display llc2

Syntax **display llc2** [**circuit** *circuit-id*]

View Any view

Parameter *circuit-id*: ID of an LLC2 virtual circuit, in the range of 0 to 4294967295.

Description Use the **display llc2** command to display LLC2 statistics.

Example # Display the statistics of the LLC2 virtual circuit by the ID of 46465025.

```
<Sysname> display llc2 circuit 46465025
llc2 circuit index 46465025
      Local   MAC  0.20.35.7b.e0.65
      Remote  MAC  0. 0.84.25.1e.e9

```

Table 37 Description on the fields of the display llc2 command

Field	Description
llc2 circuit index	Index of LLC2 circuit
Local MAC	Local MAC address of LLC2 circuit
Remote MAC	Remote MAC address of LLC2 circuit
Local Sap	Local SAP address of LLC2 circuit
Remote Sap	Remote SAP address of LLC2 circuit

Table 37 Description on the fields of the display llc2 command

Field	Description
Role	Local role of LLC2 circuit ■ primary" represents the end that initiated the circuit ■ secondary" represents the end accepted the circuit connection
State	State of the LLC2 circuit

dlsw bridge-set

Syntax **dlsw bridge-set** *bridge-set*

undo dlsw bridge-set *bridge-set*

View System view

Parameter *bridge-set*: ID of the bridge set to be mapped to DLSw, in the range of 1 to 63.

Description Use the **dlsw bridge-set** command to map the specified bridge set to DLSw.

Use the **undo dlsw bridge-set** command to remove mapping between the specified bridge set and DLSw.

By default, no bridge set is mapped to DLSw.

To enable forwarding frames of a bridge set to the remote end over a TCP connection, the local bridge set needs to be mapped to DLSw through this command. This command can be used repeated to map multiple bridge sets to DLSw.

For details about bridge set configuration, refer to "Bridging Configuration Commands" on page 549.

Example # Map the bridge set by the ID of 20 connected to DLSw.

```
<Sysname> system-view
[Sysname] bridge enable
[Sysname] bridge 20 enable
[Sysname] dlsw bridge-set 20
```

dlsw enable

Syntax **dlsw enable**

undo dlsw enable

View System view

Parameter None

Description Use the **dlsw enable** command to enable DLSw.

Use the **undo dlsw enable** command to disable DLSw.

By default, DLSw is enabled.

The execution of the **undo dlsw enable** command releases all dynamic resources without altering the configuration.

Example # Disable DLSw without changing the configuration.

```
<Sysname> system-view
[Sysname] undo dlsw enable
```

Enable DLSw.

```
<Sysname> system-view
[Sysname] dlsw enable
```

dlsw ethernet-frame-filter

Syntax **dlsw ethernet-frame-filter** *acl-number* { **inbound** | **outbound** }

undo dlsw ethernet-frame-filter { **inbound** | **outbound** }

View System view

Parameter *acl-number*: Layer 2 ACL number, in the range of 4000 to 4999.

inbound: Specifies to apply the ACL for inbound traffic.

outbound: Specifies to apply the ACL for outbound traffic.

Description Use the **dlsw ethernet-frame-filter** command to configure the DLSw router to filter Ethernet frames from or to the local SNA device by applying the specified ACL for inbound or outbound traffic.

Use the **undo dlsw ethernet-frame-filter** command to remove the ACL applied for the inbound or outbound traffic.

For more information about a Layer 2 ACL, refer to *"IPv4 ACL Configuration Commands" on page 2087* and *"IPv6 ACL Configuration Commands" on page 2103*.

Example # Apply ACL 4000 on the DLSw router to filter inbound Ethernet frames.

```
<Sysname> system-view
[Sysname] dlsw ethernet-frame-filter 4000 inbound
```

dlsw local

Syntax **dlsw local** *ip-address* [**init-window** *init-window-size* | **keepalive** *keepalive-interval* | **max-frame** *max-frame-size* | **max-window** *max-window-size* | **permit-dynamic** | **vendor-id** *vendor-id*] *

undo dlsw local *ip-address* [**init-window** | **keepalive** | **max-frame** | **max-window** | **permit-dynamic**] *

View System view

Parameter *ip-address*: IP address of the local peer to be created. This IP address must be reachable.

init-window-size: Initial local window size, in the range of 1 to 2,000. The default is 40 (frames).

keepalive-interval: Interval between keepalive messages, in seconds. The effective range is 0 to 1,200, and the default is 30 seconds. A value of 0 indicates that no keepalive message will be sent.

max-frame-size: Maximum frame size in bytes. Effective values include 516, 1,470, 1,500, 2,052, 4,472, 8,144, 11,407, 11,454, and 17,800, and the default is 1,500 bytes.

max-window-size: Maximum local window size, in the range of 1 to 2,000. The default is 50 (frames).

permit-dynamic: Permits non-peer routers to initiate connections to establish peering relationships dynamically with this router. It is not required to configure a remote peer for a router established as a local peer with this keyword included in the command.

vendor-id: DLSw vendor identifier, in the range of 00.00.00 to ff.ff.ff. The default is 00.e0.fc.

Description Use the **dlsw local** command to create a local DLSw peer.

Use the **undo dlsw local** *ip-address* command to remove the specified local DLSw peer.

Use the **undo dlsw local** *ip-address* { **init-window** | **keepalive** | **max-frame** | **max-window** | **permit-dynamic** } * command to restore the default parameters.

Deleting a local DLSw peer will automatically delete all its remote DLSw peers.

Establishing a TCP connection is the first step in establishing a DLSw circuit. To establish a TCP connection, you need to specify the IP addresses of both end systems across the TCP connection. By configuring a local DLSw peer, you specify the IP address of the local end across the TCP connection. This is required before a router can initiate or accept a TCP connection request. A router can only have one local peer.

Example # Create a local DLSw peer with the following parameters:

- IP address: 1.1.1.1
- Initial local window size: 50
- Keepalive interval: 40 seconds
- Maximum frame size: default
- Maximum local window size: default

```
<Sysname> system-view
[Sysname] dlsw local 1.1.1.1 init-window 50 keepalive 40
```

dlsw reachable

Syntax **dlsw reachable** { **mac-address** *mac-address* [**mask** *mask*] | **mac-exclusivity** | **saps** *saps-list* }

undo dlsw reachable { **mac-address** *mac-address* | **mac-exclusivity** | **saps** *saps-list* }

View System view

Parameter *mac-address*: Local reachable MAC address of the router, in the form of H-H-H.

mask: MAC address mask in the form of H-H-H, functionally similar to a subnet mask.

mac-exclusivity: Allows the router to access only those designated MAC addresses.

saps-list: List of local reachable SAP addresses of the router, in the form of *saps-list*=*saps-value*&<1-120>, where *saps-value* must be an even number in the range of 0x10 to 0xFE and &<1-120> means that you can specify up to 120 SAP addresses or SAP address ranges with this argument.

Description Use the **dlsw reachable** command to configure a local reachable MAC address or SAP addresses of the router.

Use the **undo dlsw enable** command to remove the reachability configuration.

After the **dlsw reachable** command is issued, the router notifies all connected routers of the local reachable MAC address or SAP addresses. Based on this information, the remote routers can decide whether to send frames to, without first polling, this router.

Note that you must change the configuration in time when changes occur to the local network.

Example # Permit access to MAC addresses that start with 1212.

```
<Sysname> system-view
[Sysname] dlsw reachable mac-address 1212-1212-1212 mask ffff-0000-0000
```

Allow the router to access SAP addresses 12 and 14.

```
[Sysname] dlsw reachable saps 12 14
```

Permit access to user-configured MAC addresses only.

```
[Sysname] dlsw reachable mac-exclusivity
```

dlsw reachable-cache

Syntax **dlsw reachable-cache** *mac-address* **remote** *ip-address*

undo dlsw reachable-cache *mac-address* **remote** *ip-address*

View System view

Parameter *mac-address*: MAC address of the SNA device connected to a remote peer.

ip-address: IP address of a remote peer.

Description Use the **dlsw reachable-cache** command to add the reachability information of the specified SNA device to the reachable-cache.

Use the **undo dlsw reachable-cache** command to remove the configured remote reachability information from the reachable-cache.

By default, no remote reachability information is configured.

This configuration allows the router to send frames to a remote peer without first polling it. When changes occur to the network of the remote peer, the configured reachability information needs to be updated.

Example # Add this remote reachability information to the reachable-cache: the IP address of the remote peer is 10.12.13.10, and the MAC address of the SNA device connected with it is 0102-2103-5641..

```
<Sysname> system-view
[Sysname] dlsw reachable-cache 0102-2103-5641 remote 10.12.13.10
```

dlsw remote

Syntax **dlsw remote** *ip-address* [**backup** *backup-address* | **keepalive** *keepalive-interval* | **linger** *minutes* | **max-frame** *max-frame-size* | **max-queue** *max-queue-length* | **priority** *priority*] *

undo dlsw remote *ip-address*

View System view

Parameter *ip-address*: IP address of the remote peer to be created.

backup *backup-address*: Creates a backup remote peer with the IP address of *ip-address*; *backup-address* is the IP address of the primary remote peer, which must be created prior to this backup remote peer.

keepalive-interval: Interval in seconds between keepalive messages, in the range of 0 to 1,200. The default is 30 seconds. A value of 0 indicates no keepalive will be sent.

minutes: Timeout time of the backup connection after the primary remote peer is disconnected, in units of minutes. The effective range is 0 to 1,440, and the default is 5 minutes. A value of 0 means that the backup remote peer will be kept connected after the primary remote peer is disconnected.

max-frame-size: Maximum frame size in bytes. Valid values include 516, 1,470, 1,500, 2,052, 4,472, 8,144, 11,407, 11,454, and 17,800. The default is 1,500 bytes.

max-queue-length: Size of the TCP input/output queue, in the range of 50 to 2,000. The default is 200.

priority: Transmission priority, in the range of 1 to 5. The default is 3.

Description

Use the **dlsw remote** command to create a remote DLSw peer.

Use the **undo dlsw remote** command to remove a remote peer.

After a local peer is created, a remote DLSw peer should be created to establish a TCP connection. The following command specifies the IP address of the remote router with which a TCP connection is to be established. After the configuration, the router will keep attempting to establish a TCP connection with the remote router. A router can have multiple remote peers.

Note that:

- Before creating a backup remote peer connection, make sure that a primary remote peer has been created.
- If a backup link exists after the primary link is disconnected from the TCP connection, the TCP link remains connected (you can see that a TCP connection exists by using the **display dlsw remote** command) until the backup link times out.

Example

Create a remote DLSw peer with the following parameters:

- IP address: 2.2.2.2
- Transmission priority: 2
- Keepalive interval: 40 seconds
- Maximum frame size: default
- Size of TCP input/output queue: 300

```
<Sysname> system-view
[Sysname] dlsw remote 2.2.2.2 priority 2 keepalive 40 max-queue 300
```

dlsw reverse

Syntax **dlsw reverse** *mac-address*

View System view

Parameter *mac-address*: MAC address to be converted.

Description Use the **dlsw reverse** command to convert a MAC address from the Ethernet format to the token ring format, or vice versa.

When specifying an SDLC peer MAC address for an SDLC virtual circuit, pay attention to the following situations:

- If the remote SNA device uses a token ring address, specify its MAC address directly.
- If the remote SNA device uses an Ethernet address, convert the Ethernet address to a token ring address by using the **dlsw reverse** command. For example, convert 00e0.fc03.a548 to 0007.3fc0.5a12.
- If the remote SNA device uses an SDLC link, specify a compound MAC address, in which the first five bytes are from the virtual MAC address configured in the **sdlc mac-map local** command on the remote router, and the last byte is the SDLC address of the local router.

Related command: **sdlc mac-map remote**.

Example # Convert the Ethernet format MAC address 0012-3578-4521 to the token ring format.

```
<Sysname> system-view
[Sysname] dlsw reverse 0012-3578-4521
Reversed MAC address: 0048-ac1e-a284
```

Convert the token ring MAC address 0048-ac1e-a284 to the Ethernet format.

```
[Sysname] dlsw reverse 0048-ac1e-a284
Reversed MAC address: 0012-3578-4521
```

dlsw max-transmission

Syntax **dlsw max-transmission** *retries*

undo dlsw max-transmission

View System view

Parameter *retries*: The maximum number of attempts that the DLSw v2.0 router should make to send an explorer frame. It ranges from 1 to 10 and defaults to 5.

Description Use the **dlsw max-transmission** command to set the maximum number of the attempts the DLSw v2.0 router should make to send an explorer frame.

Use the **undo dlsw max-transmission** command to restore the default.

Each time the origin DLSw v2.0 router sends an explorer frame in a UDP multicast or unicast, an explorer timer starts. If no acknowledgment is received before the explorer timer times out, the router retransmits the explorer frame and resets the explorer timer, until it receives an acknowledgment or the maximum number of explorer frame retries is reached.

You can use this command only after enabling DLSw v2.0 multicast.

Example # Set the maximum number of explorer frame transmission retries to 10.

```
<Sysname> system-view
[Sysname] dlsw max-transmission 10
```

dlsw multicast

Syntax **dlsw multicast** [*multicast-ip-address*] **interface** *interface-type interface-number*

undo dlsw multicast

View System view

Parameter *multicast-ip-address*: Multicast IP address, in the range of 224.0.10.0 to 224.0.10.191. The default is to 224.0.10.0.

interface: Specifies the interface through which DLSw v2.0 multicasts are sent.

interface-type interface-number: Specifies an interface by its type and number.

Description Use the **dlsw multicast** command to enable the multicast function of DLSw v2.0.

Use the **undo dlsw multicast** command to disable the multicast function of DLSw v2.0.

By default, the multicast function of DLSw v2.0 is disabled.

Related command: **dlsw enable**, **igmp enable** on page 1350, and **pim dm** on page 1411 and **pim sm** on page 1416.

Example # Enable the router to send DLSw 2.0 multicasts to the multicast address of 224.0.10.10 through Ethernet 1/0.

```
<Sysname> system-view
[Sysname] dlsw multicast 224.0.10.10 interface ethernet 1/0
```

dlsw timer

Syntax

dlsw timer { **cache** | **connected** | **explorer** | **explorer-wait** | **local-pending** | **remote-pending** } *seconds*

undo dlsw timer { **cache** | **connected** | **explorer** | **explorer-wait** | **local-pending** | **remote-pending** }

View

System view

Parameter

cache *seconds*: Timeout time of addresses in SNA cache, in seconds. The effective range is 1 to 65,535, and the default is 120 seconds.

connected *seconds*: Connection timeout time in seconds. The effective range is 1 to 65,535, and the default is 300 seconds.

explorer *seconds*: Remote explorer frame waiting time in seconds. The effective range is 1 to 65,535, and the default is 30 seconds.

explorer-wait *seconds*: Local explorer frame waiting time in seconds. The effective range is 1 to 65,535, and the default is 30 seconds.

local-pending *seconds*: Local pending time in seconds. The effective range is 1 to 65,535, and effective the default is 30 seconds.

remote-pending *seconds*: Remote pending time in seconds. The effective range is 1 to 65535, and the default is 30 seconds.

Description

Use the **dlsw timer** command to configure DLSw timers.

Use the **undo dlsw timer** command to restore DLSw timers to the default settings.

You can configure the timers used in creating DLSw circuits to meet your actual needs. Do this only when necessary.

Example

Configure DLSw timers as follows:

- Connection timeout time: 200 seconds
- local explorer frame waiting time: 15 seconds
- Local pending time: 15 seconds
- Remote pending time: 25 seconds
- SNA cache address timeout time: default
- Remote explorer frame waiting time: default

```
<Sysname> system-view
[Sysname] dlsw timer connected 200
[Sysname] dlsw timer explorer-wait 15
[Sysname] dlsw timer local-pending 15
[Sysname] dlsw timer remote-pending 25
```

idle-mark

Syntax **idle-mark**

undo idle-mark

View Synchronous serial interface view

Parameter None

Description Use the **idle-mark** command to configure the idle-time encoding scheme of the synchronous serial interface to be 0xFF.

Use the **undo idle-mark** command to restore the default setting.

By default, the synchronous serial interface uses "0x7E" to indicate its idle state.

While most SDLC devices use "0x7E" (flags) to indicate "idle" space between frames, some other SDLC devices use "0xFF" (marks) for this indication. For compatibility with different types of devices, you can configure the router to send either flags (default) or marks to indicate its idle state. When the synchronous serial interface is connected with an AS/400 device, you need to change the idle-time encoding scheme by using this command to improve the speed of polling the AS/400 device.

Example # Configure synchronous serial interface Serial 2/0 to send 0xFF to indicate idle space between frames.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] idle-mark
```

link-protocol sdlc

Syntax **link-protocol sdlc**

View Synchronous serial interface view

Parameter None

Description Use the **link-protocol sdlc** command to configure the synchronous serial interface to use SDLC as link layer encapsulation protocol.

By default, the default link layer protocol is PPP.

For SNA, SDLC is a link layer protocol, working very similarly as HDLC. To ensure that DLSw works normally, you need to enable SDLC as the link layer encapsulation protocol on the synchronous serial interface.

Note that you need to remove all IP related configurations on the interface before enabling SDLC, because SDLC cannot underlie the IP protocol. For example, you need to delete the IP address of the interface.

Example # Configure Serial 2/0 to use SDLC as the link layer encapsulation protocol.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol sdlc
```

llc2 max-ack

Syntax **llc2 max-ack** *length*

undo llc2 max-ack

View Ethernet interface view

Parameter *length*: The maximum number of information frames the router can receive before it must send an acknowledgment, in the range of 1 to 127.

Description Use the **llc2 max-ack** command to configure namely the maximum number of information frames the device can receive before it must send an acknowledgment to the peer router.

Use the **undo llc2 max-ack** command to restore the default setting.

By default, the maximum number of information frames the router can receive before it must send an acknowledgment is 3.

Example # Set the maximum number of information frames the router can receive before it must send an acknowledgment to 5 on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 max-ack 5
```

llc2 max-pdu

Syntax **llc2 max-pdu** *length*

undo llc2 max-pdu

View Ethernet interface view

Parameter *length*: Maximum LLC2 PDU size in bytes, in the range of 1 to 1,700.

Description Use the **max-pdu** command to configure the maximum LLC2 PDU size.

Use the **undo max-pdu** command to restore the default maximum LLC2 PDU size.

By default, the maximum LLC2 PDU size is 1,493 bytes.

Example # Set the maximum LLC2 PDU size to 1,000 bytes on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 max-pdu 1000
```

llc2 max-send-queue

Syntax **llc2 max-send-queue** *length*

undo llc2 max-send-queue

View Ethernet interface view

Parameter *length*: The length of the LLC2 output queue, in the range of 20 to 200.

Description Use the **llc2 max-send-queue** command to configure the length of the LLC2 output queue.

Use the **undo llc2 max-send-queue** command to restore the default setting.

By default, the length of the LLC2 output queue is 50.

Example # Set the length of the LLC2 output queue to 30 on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 max-send-queue 30
```

llc2 max-transmission

Syntax **llc2 max-transmission** *retries*

undo llc2 max-transmission

View Ethernet interface view

Parameter *retries*: LLC2 transmission retries, in the range of 1 to 255.

Description Use the **llc2 max-transmission** command to configure the number of LLC2 transmission retries, namely the maximum number of times an information frame is retransmitted before an acknowledgment frame is received from the peer.

Use the **undo llc2 max-transmission** command to restore the default setting.

By default, the number of LLC2 transmission retries is 3.

Example # Set the number of LLC2 transmission retries to 10 on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 max-transmission 10
```

llc2 modulo

Syntax **llc2 modulo** { **8** | **128** }

undo llc2 modulo

View Ethernet interface view

Parameter **8**: Specifies the modulus value to be 8.

128: Specifies the modulus value to be 128.

Description Use the **llc2 modulo** command to configure the modulus of LLC2.

Use the **undo llc2 modulo** command to restore the default modulus of LLC2.

By default, the modulus of LLC2 is 128.

LLC2, like X.25, uses modulus to number frames. All frames sent are numbered incrementally and await an acknowledgment. When the frame number reaches the configured value (referred to as "modulus value"), subsequent frames are numbered from 1 again. For example, if the modulus value is set to 8, frames are numbered ...4, 5, 6, 7, 0, 1, ...

LLC2 supports two modulus values: 8 or 128. 128 is usually used for Ethernet frames.

Example # Set the modulus value for LLC2 frames to 8 on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 modulo 8
```

llc2 receive-window

Syntax **llc2 receive-window** *length*

undo llc2 receive-window

View Ethernet interface view

Parameter *length*: The maximum number of consecutive information frames the router can send before receiving an acknowledgment from the peer, in the range of 1 to 127.

Description Use the **llc2 receive-window** command to configure the maximum number of consecutive information frames the router can send before receiving an acknowledgment from the peer.

Use the **undo llc2 receive-window** command to restore the default setting.

By default, the maximum number of consecutive information frames the router can send before receiving an acknowledgment from the peer is 7.

Example # Set the maximum number of consecutive information frames the router can send before receiving an acknowledgment from the peer to 10 on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 receive-window 10
```

llc2 timer ack

Syntax **llc2 timer ack** *mseconds*

undo llc2 timer ack

View Ethernet interface view

Parameter *mseconds*: LLC2 acknowledgment waiting time in milliseconds. The effective range is 1 to 60,000.

Description Use the **llc2 timer ack** command to configure the LLC2 acknowledgment waiting time, namely the maximum length of time the router waits for an acknowledgment from the peer after sending an LLC2 frame.

Use the **undo llc2 timer ack** command to restore the default setting.

By default, the LLC2 acknowledgment waiting time is 200 milliseconds.

Example # Set the LLC2 acknowledgment waiting time to 10 milliseconds on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 timer ack 10
```

llc2 timer ack-delay

Syntax **llc2 timer ack-delay** *mseconds*

undo llc2 timer ack-delay

View Ethernet interface view

Parameter *mseconds*: LLC2 local acknowledgment delay, in milliseconds. The effective range is 1 to 60,000.

Description Use the **llc2 timer ack-delay** command to configure the LLC2 local acknowledgment delay time, namely the maximum length of time the device waits before sending an acknowledgment to the peer end upon receiving an LLC2 frame.

Use the **undo llc2 timer ack-delay** command to restore the default setting.

By default, the LLC2 local acknowledgment delay time is 100 milliseconds.

Example # Set the LLC2 local acknowledgment delay time to 200 milliseconds on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 timer ack-delay 200
```

llc2 timer busy

Syntax **llc2 timer busy** *mseconds*

undo llc2 timer busy

View Ethernet interface view

Parameter *mseconds*: LLC2 busy-station polling interval, in milliseconds. The effective range is 1 to 60,000. The system default is 300 milliseconds.

Description Use the **llc2 timer busy** command to configure the LLC2 busy-station polling interval, namely the amount of time the router waits before repelling a busy station.

Use the **undo llc2 timer busy** command to restore the default setting.

Example # Set the LLC2 busy-station polling interval to 200 milliseconds on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 timer busy 200
```

llc2 timer detect

Syntax **llc2 timer detect** *mseconds*

undo llc2 timer detect

View Ethernet interface view

Parameter *mseconds*: LLC2 POLL timer length in milliseconds. The effective range is 1 to 60,000.

Description Use the **llc2 timer detect** command to configure the LLC2 POLL timer, namely the interval at which both ends of a virtual circuit sends/receives Receiver Ready (RR) frames after the virtual circuit is established.

Use the **undo llc2 timer detect** command to restore the default setting.

By default, the LLC2 POLL timer length is 30,000 milliseconds.

Example # Set the LLC2 POLL timer length to 10,000 milliseconds on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 timer detect 10000
```

llc2 timer poll

Syntax **llc2 timer poll** *mseconds*

undo llc2 timer poll

View Ethernet interface view

Parameter *mseconds*: LLC2 P/F waiting time in milliseconds. The effective range is 1 to 60,000.

Description Use the **llc2 timer poll** command to configure the LLC2 P/F waiting time, namely the amount of time the router waits for an acknowledgment after sending a P frame.

Use the **undo llc2 timer poll** command to restore the default setting.

By default, the LLC2 P/F waiting time is 5,000 milliseconds.

When a router sends a frame that requires an acknowledgment, the frame is sent with a poll bit set. This frame is known as a P frame. Once the router sends a P frame, it cannot send any other P frame until it receives an acknowledgment, namely a frame with a final bit set, or until the LLC2 P/F waiting time expires.

Example # Set the LLC2 P/F waiting time to 2,000 milliseconds on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 timer poll 2000
```

llc2 timer reject

Syntax **llc2 timer reject** *mseconds*

undo llc2 timer reject

View Ethernet interface view

Parameter *mseconds*: LLC2 REJ status time in milliseconds. The effective range is 1 to 60,000.

Description Use the **llc2 timer reject** command to configure the LLC2 REJ status time, namely the amount of time the router waits for the expected frame after it receives an unexpected frame and sends a reject frame.

Use the **undo llc2 timer reject** command to restore the default setting.

By default, the LLC2 REJ status time is 500 milliseconds.

Example # Set the LLC2 REJ time to 2, 000 milliseconds on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] llc2 timer reject 2000
```

reset dlsw circuits

Syntax **reset dlsw circuits** [*circuit-id*]

View User view

Parameter *circuit-id*: DLSw virtual circuit ID, in the range of 0 to 0xFFFFFFFF.

Description Use the **reset dlsw circuits** command to clear DLSw virtual circuit information.

Note that this command without *circuit-id* clears the information of all DLSw virtual circuits; otherwise, this command clears the information of the specified virtual circuit.

Example # Clear the information of virtual circuit 100.

```
<Sysname> reset dlsw circuits 100
```

reset dlsw reachable-cache

Syntax **reset dlsw reachable-cache**

View User view

Parameter None

Description Use the **reset dlsw reachable-cache** command to clear DLSw reachability information.

Example # Clear the DLSw reachability information.

```
<Sysname> reset dlsw reachable-cache
```

reset dlsw tcp

Syntax **reset dlsw tcp** [*ip-address*]

View User view

Parameter *ip-address*: IP address of the remote peer.

Description Use the **reset dlsw tcp** command to reset the TCP connection between the DLSw router and a remote peer or all remote peers.

Note that:

- This command without *ip-address* resets the TCP connections between the DLSw router and all current remote peers; otherwise, this command resets the TCP connection between the DLSw router and the specified remote peer.
- In the case of a manual configured remote peer, this command disconnects the current TCP connection, and initiates a new TCP connection request to establish new TCP connection.
- In the case of a remote peer dynamically learned, this command disconnects the current TCP connection and deletes the remote peer.

Example # Reset the TCP connections will all remote peers.

```
<Sysname> debugging dlsw tcp
<Sysname> reset dlsw tcp
DLSw_TCP 4.4.4.2:The remote peer is learned dynamically ,it will be deleted
DLSW_TCP 4.4.4.3:Rebulid tcp with the peer
```

Reset the TCP connection with a remote peer with the IP address of 4.4.4.2.

```
<Sysname> reset dlsw tcp 4.4.4.2
DLSw_TCP 4.4.4.2:The remote peer is learned dynamically ,it will be deleted
```

Table 38 Description on the fields of the reset dlsw tcp command

Field	Description
DLSw_TCP 4.4.4.2:The remote peer is learned dynamically,it will be deleted	The remote peer 4.4.4.2 was learned dynamically and will be deleted by DLSw.
DLSW_TCP 4.4.4.3 : rebuild tcp with the peer	The remote peer 4.4.4.3 was manually configured and therefore the TCP connection with it will be reestablished.

Table 38 Description on the fields of the reset dlsw tcp command

Field	Description
Error: Wrong IP address	Invalid IP address entered
Error: No specified peer is found	The specified peer does not exist.

sdlc controller

Syntax **sdlc controller** *sdlc-address*

undo sdlc controller *sdlc-address*

View Synchronous serial interface view

Parameter *sdlc-address*: Address of the secondary SDLC station to be configured, in the range of 0x01 to 0xFE.

Description Use the **sdlc controller** command to configure the address of a secondary SDLC station address.

Use the **undo sdlc controller** command to delete the address of an secondary SDLC station.

By default, no secondary SDLC station address is configured.

The SDLC protocol allows multiple virtual circuits to run on an SDLC physical link, with one end connected to the primary station and the other end connected to the secondary station. In order to distinguish different virtual circuits, you need to specify an SDLC address for each virtual circuit.

SDLC is an "unbalanced" protocol: a primary station can be connected with multiple secondary devices through a multi-user system or an SDLC switch, while the secondary devices cannot be connected with one another. Therefore, the communication between the primary station and each secondary station can be guaranteed as long as each secondary device is identified with an SDLC address. This command is used to specify an SDLC address for a virtual circuit, which is unique on a physical interface.

The configured SDLC address on a synchronous serial interface is actually the address of a secondary SDLC station.

- On the serial interface of the DLSw router connected with the primary SDLC station, you need to configure the address of each secondary SDLC station that communicates with the primary station.
- On the serial interface of the DLSw router connected with a secondary SDLC station, you need to configure the address of each secondary SDLC station connected with the serial interface.

An SDLC address ranges from 0x01 to 0xFE. The SDLC address of a router is valid on only one physical interface. That is, the SDLC addresses configured on different interfaces may be the identical.

Example # Set the secondary SDLC station address to 0x05 on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc controller 05
```

sdlc enable dlsw

Syntax **sdlc enable dlsw**

undo sdlc enable dlsw

View Synchronous serial interface view

Parameter None

Description Use the **sdlc enable dlsw** command to enable DLSw forwarding on the current synchronous serial interface.

Use the **undo sdlc enable dlsw** command to disable DLSw forwarding on the current synchronous serial interface.

By default, DLSw forwarding is not enabled on the serial interface.

Before enabling DLSw forwarding on the serial interface, enable SDLC as the link layer protocol on the interface. With DLSw forwarding enabled on the SDLC interface, all local SNA devices connected to the interface will be able to communicate with the remote device through DLSw.

Example # Enable DLSw forwarding on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol sdlc
[Sysname-Serial2/0] sdlc enable dlsw
```

sdlc mac-map local

Syntax **sdlc mac-map local** *mac-address*

undo sdlc mac-map local

View Synchronous serial interface view

Parameter *mac-address*: Virtual MAC address of SDLC.

Description Use the **sdlc mac-map local** command to configure an SDLC virtual MAC address.

Use the **undo sdlc mac-map local** command to delete the configured SDLC virtual MAC address.

By default, no SDLC virtual MAC address is configured.

Initially designed for LLC2 protocols, DLSw establishes mappings with virtual circuits through MAC addresses. Therefore, a MAC address must be specified for an SDLC virtual circuit so that SDLC frames can be forwarded. This command is used to assign the current interface a virtual MAC address, which will serve as the source MAC address during the conversion of SDLC frames to LLC2 frames.

Note that the sixth byte of the MAC address should be set to 0x00. The system will combine the first five bytes of this virtual MAC address with the SDLC address into a new MAC address, which will serve as the source MAC address in SDLC-to-LLC2 frame format conversion.

Example # Set the SDLC virtual MAC address to 0000-e81c-b600 on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc mac-map local 0000-e81c-b600
```

sdlc mac-map remote

Syntax **sdlc mac-map remote** *mac-addr sdlc-addr*

undo sdlc mac-map remote *mac-addr sdlc-addr*

View Synchronous serial interface view

Parameter *mac-addr*: MAC address of the SDLC peer to be configured.

sdlc-addr: SDLC address of the SDLC peer to be configured, in the range of 0x01 to 0xFE.

Description Use the **sdlc mac-map remote** command to configure an SDLC peer.

Use the **undo sdlc mac-map remote** command to delete an SDLC peer.

By default, the synchronous serial interface has no remote peer.

This command is used to specify the MAC address of the corresponding peer end for an SDLC virtual circuit so as to provide the destination MAC address for SDLC-to-LLC2 frame conversion. In DLSw configuration, a peer should be configured for each SDLC address. The MAC address of the peer should be the MAC address of the remote SNA device (physical address in the Ethernet or Token Ring format), or the compound MAC address obtained from SDLC virtual MAC address of the peer end and the SDLC address of the local end.

In this configuration, pay attention to the difference in bit order between token ring address and an Ethernet address:

- If the remote SDLC peer to be configured uses a token ring address, use its token ring address directly;
- If the remote SDLC peer uses an Ethernet address, reverse the bit order of the Ethernet address: for example, convert 00e0.fc03.a548 to 0007.3fc0.5a12. You are recommended to use the **dlsw reverse** command to avoid errors that may be introduced in manual conversion.

Example # Configure an SDLC peer on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc mac-map remote 00E0-FC00-0010 05
```

sdlc max-pdu

Syntax **sdlc max-pdu** *number*

undo sdlc max-pdu

View Synchronous serial interface view

Parameter *number*: Maximum SDLC PDU size in bytes, in the range of 1 to 17,600.

Description Use the **sdlc max-pdu** command to configure the maximum SDLC PDU size, namely the maximum size in bytes of a frame that the router can send, not including the frame check sequence (FCS), start flag and ending flag fields.

Use the **undo sdlc max-pdu** command to restore the default setting.

By default, the maximum SDLC PDU size is 265 bytes.

The maximum PDU size of some PU2.0 devices is 265 bytes, while that of an IBM AS/400 is 521 bytes. Typically, this maximum PDU size should be configured be the same as on the peer SDLC device.

Example # Set the maximum SDLC PDU size to 521 on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc max-pdu 521
```

sdlc max-send-queue

Syntax **sdlc max-send-queue** *length*

undo sdlc max-send-queue

View Synchronous serial interface view

Parameter *length*: Length of the SDLC output queue, in the range of 20 to 255.

Description Use the **sdlc max-send-queue** command to configure the length of the SDLC output queue.

Use the **undo sdlc max-send-queue** command to restore the default setting.

By default, the length of the SDLC output queue is 50.

Example # Set the length of the SDLC output queue to 30 on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc max-send-queue 30
```

sdlc max-transmission

Syntax **sdlc max-transmission** *retries*

undo sdlc max-transmission

View Synchronous serial interface view

Parameter *retries*: Maximum number of SDLC transmission retries, in the range of 1 to 255 times.

Description Use the **sdlc max-transmission** command to configure the maximum number of SDLC transmission retries, namely the number of times a frame is retransmitted before an acknowledgment is received from the peer.

Use the **undo sdlc max-transmission** command to restore the default setting.

By default, the maximum number of SDLC transmission retries is 20.

Example # Set the maximum SDLC transmission retries to 30 on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc max-transmission 30
```

sdlc modulo

Syntax **sdlc modulo** { **8** | **128** }

undo sdlc modulo

View Synchronous serial interface view

Parameter **8**: Specifies the modulus value to be 8.

128: Specifies the modulus value to be 128.

Description Use the **sdlc modulo** command to configure the modulus of the SDLC.

Use the **undo sdlc modulo** command to restore the default setting.

By default, the SDLC modulus is 8.

Like X.25, SDLC uses the modulus method to number frames. All frames sent are numbered incrementally and await an acknowledgment. When the frame number reaches the configured value (referred to as "modulus value"), subsequent frames are numbered from 1 again. For example, if the modulus value is set to 8, frames are numbered ...4, 5, 6, 7, 0, 1, ...

SDLC normally uses 8 as the modulus value.

Example # Restore the modulus value of SDLC to the default setting on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] undo sdlc modulo
```

sdlc sap-map local

Syntax **sdlc sap-map local** *lsap sdlc-addr*

undo sdlc sap-map local *lsap sdlc-addr*

View Synchronous serial interface view

Parameter *lsap*: SAP address, in the range of 0x01 to 0xFE.

sdlc-addr: SDLC address, in the range of 0x01 to 0xFE.

Description Use the **sdlc sap-map local** command to configure the local SAP address to be used in SDLC-to-LLC2 frame format conversion.

Use the **undo sdlc sap-map local** command to restore the system default.

By default, the local SAP address used in SDLC-to-LLC2 frame format conversion is 0x04.

When an SDLC frame is converted into an LLC2 frame, a SAP address is needed in addition to the MAC address.

Generally speaking, the SAP address used by the SNA protocol is 0x04, 0x08 or 0x0C.

Related command: **sdlc sap-map remote**.

Example # Configure the SAP address to be used in SDLC-to-LLC2 frame format conversion on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc sap-map local 08 05
```

sdlc sap-map remote

Syntax **sdlc sap-map remote** *dsap sdlc-addr*

undo sdlc sap-map remote *dsap sdlc-addr*

View Synchronous serial interface view

Parameter *dsap*: SAP address of the DLSw peer device, in the range of 0x01 to 0xFE.

sdlc-addr: SDLC address, in the range of 0x01 to 0xFE.

Description Use the **sdlc sap-map remote** command to configure the SAP address of the remote DLSw device for use in SDLC-to-LLC2 frame format conversion.

Use the **undo sdlc sap-map remote** command to restore the system default.

By default, the SAP address of the remote DLSw device used in SDLC-to-LLC2 frame format conversion is 0x04.

When an SDLC frame is converted to an LLC2 frame, a SAP address is needed in addition to the MAC address.

Generally speaking, the SAP address used by the SNA protocol is 0x04, 0x08 or 0x0C.

Related command: **sdlc sap-map local**.

Example # Configure the SAP address of the remote DLSw device for use in SDLC-to-LLC2 frame format conversion on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc sap-map remote 0C 05
```

sdlc simultaneous

Syntax **sdlc simultaneous**

undo sdlc simultaneous

View Synchronous serial interface view

Parameter None

Description Use the **sdlc simultaneous** command to configure the SDLC synchronous serial interface to work in two-way simultaneous mode, so that the primary SDLC station can send data to and receive data from a secondary station at the same time.

Use the **undo sdlc simultaneous** command to restore the default mode.

By default, the data transmission mode is "alternate".

Example # Enable the two-way simultaneous mode for SDLC data on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc simultaneous
```

sdlc status

Syntax **sdlc status** { **primary** | **secondary** }

undo sdlc status { **primary** | **secondary** }

View Synchronous serial interface view

Parameter **primary**: Specifies that the SDLC device connected to the router is "secondary".

secondary: Specifies that the SDLC device connected to the router is "primary".

Description Use the **sdlc role** command to configure a SDLC role.

Use the **undo sdlc role** command to remove the configured SDLC role.

By default, the device has no role.

SDLC is an "unbalanced" link layer protocol. That is, the end systems across a TCP connection are not equal in the positions: one is primary and the other is secondary. The primary station, whose role is **primary**, plays a dominant role and controls the whole connection process. The secondary station, whose role is **secondary**, is controlled by the primary station. Therefore, we need to configure a role for an SDLC interface.

In the SDLC role configuration, the role of an interface should be determined by the role of the SDLC device to which this router is connected:

- If the SDLC device connected with the local router has a role of **primary**, the local interface should be configured to have a role of **secondary**;
- If the SDLC device connected with the local router has a role of **secondary**, the local interface should be configured to have a role of **primary**.

Generally, an IBM mainframe has a role of **primary**, while a terminal device such as a UNIX host or an Auto Teller Machine (ATM) has a role of **secondary**.

Example # Set the role of the SDLC device connected with Serial 2/0 to **primary**, and the role of the local interface to **secondary**.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc status secondary
```

sdlc timer ack

Syntax **sdlc timer ack** *mseconds*

undo sdlc timer ack

View Synchronous serial interface view

Parameter *mseconds*: Primary-station acknowledgment waiting time: in milliseconds. The effective range is 1 to 60,000.

Description Use the **sdlc timer ack** command to configure the primary-station acknowledgment waiting time, namely the amount of time the primary SDLC station waits for an acknowledgment from the receiving secondary station after sending an information frame.

Use the **undo sdlc timer ack** command to restore the default setting.

By default, the primary-station acknowledgment waiting time is 3,000 milliseconds.

Example # Set the primary-station acknowledgment waiting time to 2,000 milliseconds on Serial 2/0.

```
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc timer ack 2000
```

sdlc timer lifetime

Syntax **sdlc timer lifetime** *mseconds*

undo sdlc timer lifetime

View Synchronous serial interface view

Parameter *mseconds*: Secondary-station acknowledgment waiting time in milliseconds. The effective range is 1 to 60,000.

Description Use the **sdlc timer lifetime** command to configure the secondary-station acknowledgment waiting time, namely the amount of time a secondary SDLC station waits for an acknowledgment from the primary station after sending an information frame.

Use the **undo sdlc timer lifetime** command to restore the default setting.

By default, the secondary-station acknowledgment waiting time is 500 milliseconds.

Example # Set the secondary-station acknowledgment waiting time to 1,000 milliseconds on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc timer lifetime 1000
```

sdlc timer poll

Syntax **sdlc timer poll** *mseconds*

undo sdlc timer poll

View Synchronous serial interface view

Parameter *mseconds*: SDLC polling interval in milliseconds. The effective range is 1 to 10,000.

Description Use the **sdlc timer poll** command to configure the SDLC polling interval, namely the amount of time the primary station waits between polling two secondary stations.

Use the **undo sdlc timer poll** command to restore the default setting.

By default, SDLC polling interval is 1,000 milliseconds.

Example # Set the SDLC polling interval to 200 milliseconds on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc timer poll 200
```

sdlc window

Syntax **sdlc window** *length*

undo sdlc window

View Synchronous serial interface view

Parameter *length*: The maximum number of consecutive frames the device can send before receiving an acknowledgement from the peer, in the range of 1 to 7.

Description Use the **sdlc window** command to configure the maximum number of consecutive frames the device can send before receiving an acknowledgement from the peer.

Use the **undo sdlc window** command to restore the default setting.

By default, the maximum number of consecutive frames the device can send before receiving an acknowledgement from the peer is 7.

Example # Set the maximum number of consecutive frames the device can send before receiving an acknowledgement from the peer to 5 on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc window 5
```

sdlc xid

Syntax **sdlc xid** *sdlc-address xid-number*

undo sdlc xid *sdlc-address*

View Synchronous serial interface view

Parameter *sdlc-address*: SDLC address corresponding to the XID to be configured, in the range of 0x01 to 0xFE. This address should be configured beforehand.

xid-number: XID of the SDLC-enabled device, a 4-byte integer, in the range of 1 to 0xFFFFFFFF. The first 12 bits indicate the network address, and the last 20 bits indicate the node number.

Description Use the **sdlc xid** command to configure the XID of the SDLC.

Use the **undo sdlc xid** command to delete the XID of the SDLC.

By default, no SDLC XID is configured on a synchronous serial interface.

An XID identifies a device in an SNA system. When configuring an SDLC connection, pay attention to the types of the connected SNA devices. Generally, there are two types of devices in an SNA system: PU2.0 and PU2.1. An XID has been configured on PU2.1 devices, so they can announce their identity by exchanging the XID. A PU2.0 device does not come with an XID. Therefore, this command is not needed on PU2.1 devices, but it is required on PU2.0 devices to specify an XID.

Example # Set the XID of the device whose SDLC address is 0x05 to 0x2000 on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] sdlc xid 05 2000
```

22 FRAME RELAY CONFIGURATION COMMANDS

annexg

Syntax **annexg** {dce | **dte**}

undo annexg {dce | **dte**}

View DLCI interface view

Parameter **dce**: Specifies the DLCI interface as an Annex G DTE interface.

dte: Specifies the DLCI interface as an Annex G DCE interface.

Description Use the **annexg** command to configure the operating mode (Annex G DCE or Annex DTE) for a DLCI interface.

Use the **undo annexg** command to remove the configuration.

By default, a DLCI interface does operate in the Annex G DCE mode.

ANSI T1.617 Annex G defines the way to transmit X.25 packets using FR virtual circuits. Similar to normal X.25 interface, an Annex G interface transmits/receives X.25 PVC and X.25 SVC packets and can operate as an X.25 switching interface. You can set LAPB-/X.25-related parameters for a virtual circuit by applying an X.25 template to it.

Example # Create an Annex G DTE interface.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr dlci 100
[Sysname-fr-dlci-Serial2/0-100] annexg dte
```

display fr compress

Syntax **display fr compress** [interface *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display fr compress** command to display the statistics information about frame relay compression. If no interface is specified, the DLCI statistics information for all interfaces is displayed.

Related commands: **fr compression frf9**.

Example # Display the frame relay compression statistics information of FRF.9 stac.

```
<Sysname> display fr compress
Serial2/0
 -DLCI:22
    enable frame-relay compression
    uncompressed bytes send/receive : 0/0
    compressed bytes send/receive : 0/0
    1 min  avg ratio send/receive :  0.000/0.000
5 min  avg ratio send/receive :  0.000/0.000
```

Table 39 Description on the fields of the display fr compress command

Field	Description
enable frame-relay compression	Frame relay compression is enabled
uncompressed bytes send/receive	Size of the uncompressed data transmitted /received (in bytes)
compressed bytes send/receive	Size of the compressed data transmitted/received (in bytes)
1 min avg ratio send/receive	Average transmission/receiving rate during the latest one minute
5 min avg ratio send/receive	Average transmission/receiving rate during the latest five minutes

display fr dlci-switch

Syntax **display fr dlci-switch** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display fr dlci-switch** command to display the information about the configured FR switching to check if the frame relay switching of a user is correctly configured.

The interface specified by *interface-type interface-number* can only be a main interface. If no interface is specified, this command displays the information about all the main interfaces.

Example # Display the information of the configured FR switching.

```
<Sysname> display fr dlci-switch
Frame relay switch statistics
Status   Interface(Dlci)   <---------->   Interface(Dlci)
Inactive Serial2/1(100)                 Serial2/0(300)
```

Table 40 Description on the fields of the display fr dlci-switch command

Field	Description
Frame relay switch statistics	The statistics of frame relay switch
Status	The status of frame relay switching function
Interface(Dlci) <----------> Interface(Dlci)	Input interface and its DLCI, output interface and its DLCI.

display fr inarp-info

Syntax **display fr inarp-info** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number. It can only be a main interface.

Description Use the **display fr inarp-info** command to display statistics about frame relay inverse ARP (INARP) packets, including requests and replies, for the specified or all interfaces.

You may use this command to diagnose whether INARP is operating normally.

Related command: **fr inarp**.

Example # Display statistics about frame relay INARP packets.

```
<Sysname> display fr inarp-info
Frame relay InverseARP   statistics for interface Serial2/0 (DTE)
In ARP request    Out ARP reply    Out ARP request    In ARP reply
0                 0                1                  1
```

Table 41 Description on the fields of the display fr inarp-info command

Field	Description
Frame relay InverseARP statistics for interface Serial2/0 (DTE)	Display frame relay INARP packet statistics of the interface
In ARP request	Received ARP requests
Out ARP reply	Transmitted ARP replies
Out ARP request	Transmitted ARP requests
In ARP reply	Received ARP replies

display fr interface

Syntax **display fr interface** [*interface-type* { *interface-number* | *interface-number.subnumber* }]

View Any view

Parameter *interface-type* { *interface-number* | *interface-number.subnumber* }: Specifies an interface by its type and number. The *interface-number* argument is a main interface number. The *subnumber* argument is a subinterface number, in the range 0 to 1023.

Description Use the **display fr interface** command to display information about the specified or all frame relay interfaces.

You can specify a main interface or a subinterface by providing the *interface-type* { *interface-number* | *interface-number.subnumber* } argument combination.

Example # Display information about all frame relay interfaces.

```
<Sysname> display fr interface
Serial2/0, multi-point, protocol up
Serial2/0.1, point-to-point, protocol down
```

Table 42 Description on the fields of the display fr interface command

Field	Description
Serial2/0, multi-point, protocol up	Frame relay interface, its type and link layer state
Serial2/0.1, point-to-point, protocol down	Subinterface, its type and link layer state

display fr lmi-info

Syntax **display fr lmi-info** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display fr lmi-info** command to display the statistics of LMI protocol frame.

The LMI protocol maintains current frame relay link by sending status enquiry packets and status packets. The displayed information helps you diagnose faults.

Example # Display the statistics about LMI protocol frames.

```
<Sysname> display fr lmi-info
Frame relay LMI statistics for interface Serial2/1 (DTE, Q933)
T391DTE = 10 (hold timer 10)
N391DTE = 6, N392DTE = 3, N393DTE = 4
out status enquiry = 96, in status = 85
status timeout = 3, discarded messages = 3
Frame relay LMI statistics for interface Serial2/0 (DCE, Q933)
T392DCE = 15, N392DCE = 3, N393DCE = 4
in status enquiry = 0, out status = 0
status enquiry timeout = 0, discarded messages = 0
```

Table 43 Description on the fields of the display fr lmi-info command

Field	Description
Frame relay LMI statistics for interface Serial2/1 (DTE, Q933)	Terminal type and LMI protocol type for the frame relay interface
T391DTE = 10 (hold timer 10)	DTE-side T.391 setting
N391DTE = 6, N392DTE = 3, N393DTE = 4	DTE-side N.391, N.392, and N.393 settings
out status enquiry = 96, in status = 85	Number of the state enquiry packets sent out through the interface and that of the state enquiry packets received through the interface
status timeout = 3, discarded messages = 3	Number of the state packets that are timed out and that of the discarded packets
Frame relay LMI statistics for interface Serial2/0 (DCE, Q933)	Serial2/0 (a frame relay interface) is a DCE interface conformed with the standard described in Q.933 appendix A
T392DCE = 15, N392DCE = 3, N393DCE = 4	The T392, N392, and N393 parameters of the DCE interface
in status enquiry = 0, out status = 0	Number of the status packets received through the interface and that of the status packets sent out through the interface
status enquiry timeout = 0, discarded messages = 0	Number of the state packets that are timed out and that of the discarded packets

display fr iphc

Syntax **display fr iphc** [**interface** interface-type interface-number]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number. It can only be a main interface.

Description Use the **display fr iphc** command to display statistics about frame relay FRF.20 compression for the specified or all interfaces.

Related command: **fr compression iphc**.

Example # Display statistics about frame relay FRF.20 (FRF.20 IPHC) compression.

```
<Sysname> display fr iphc
Serial2/0 -DLCI:100
  RTP header compression information:
    Compression:
        Total packets:              0 , Packets compressed:              0
        Link searches:              0 , Search missed     :              0
        Bytes saved  :              0 , Bytes sent        :              0
    Decompression:
        Total packets:              0 , Packets compressed:              0
        Errors       :             0
    Compression-connections: 16 , Decompression-connections: 16

  Information of TCP header compression:
    Compression:
```

```
    Total packets:              8 , Packets compressed:              5
    Link searches:              0 , Search Missed     :              1
    Bytes saved  :            173 , Bytes sent        :            598
Decompression:
    Total packets:              6 , Packets compressed:              4
    Errors       :              0
Compression-connections: 16 , Decompression-connections: 16
```

Table 44 Description on the fields of the display fr iphc command

Field	Description
RTP header compression information	Information of RTP header compression
Information of TCP header compression	Information of TCP header compression
Compression	Information of compression
Decompression	Information of decompression
Compression-connections	Number of most compression-connection
Total packets	Total number of packets
Packets compressed	Number of packets compressed
Link searches	Times of link search
Search missed	Times of search missed
Bytes saved	Number of bytes saved
Bytes sent	Number of bytes sent
Errors	Number of error
Compression-connections: 16 Decompression-connections: 16	The most connection number of compression and depression

display fr map-info

Syntax **display fr map-info** [**interface** *interface-type* { *interface-number* | *interface-number.subnumber* }]

View Any view

Parameter **interface** *interface-type* { *interface-number* | *interface-number.subnumber* }: Specifies an interface by its type and number. It can be a main or subinterface. The *interface-type* argument is an interface type. The *interface-number* argument is a main interface number. The *subnumber* argument is a subinterface number, in the range 0 to 1023.

Description Use the **display fr map-info** command to display all frame relay address mappings or the one for the specified interface.

This command displays whether the static address map entries are correct and whether dynamic address mapping operates normally.

Related command: **fr map ip**, **fr inarp**.

Example # Display the frame relay address map table.

```
<Sysname> display fr map-info
Map Statistics for interface Serial2/0 (DTE)
DLCI = 100, IP INARP 100.100.1.1, Serial2/0
create time = 2002/10/21 14:48:44, status = ACTIVE
encapsulation = ietf, vlink = 14, broadcast
DLCI = 200, IP INARP 100.100.1.1, Serial2/0
create time = 2002/10/21 14:34:42, status = ACTIVE
encapsulation = ietf, vlink = 0, broadcast
DLCI = 300, IP 1.1.1.1, Serial2/0
create time = 2002/10/21 15:03:35, status = ACTIVE
encapsulation = ietf, vlink = 15
```

Table 45 Description on the fields of the display fr map-info command

Field	Description
Map Statistics for interface Serial2/0 (DTE)	Display the frame relay address map. The interface operates in DTE mode.
DLCI = 100, IP INARP 100.100.1.1, Serial2/0	The PVC with DLCI 100 is mapped to remote IP address 100.100.1.1 through INARP. The PVC is configured on the interface Serial2/0 (If the keyword INAPP is not provided, you need to manually configure established address mapping.)
create time = 2002/10/21 14:48:44	Time and date when the map entry was created
status = ACTIVE	State of the map entry
encapsulation = ietf	Encapsulation is set to IETF
broadcast	Broadcasts are permitted

display fr map-info pppofr

Syntax **display fr map-info pppofr** [**interface** *interface-type* { *interface-number* | *interface-number.subnumber* }]

View Any view

Parameter **interface** *interface-type* { *interface-number* | *interface-number.subnumber* }: Specifies an interface by its type and number. It can be a main or subinterface. The *interface-type* argument is an interface type. The *interface-number* argument is a main interface number. The *subnumber* argument is a subinterface number, in the range 0 to 1023.

Description Use the **display fr map-info pppofr** command to display current PPP over frame relay (PPPoFR) mappings and their states for the specified or all interfaces.

Example # Display information about current PPPoFR mappings and their states.

```
<Sysname> display fr map-info pppofr
Fr Interface    DLCI    Fr State      PPP Interface         PPP Phase
Serial2/0     100     down          Virtual-Template1     Phase:0
Serial2/1     200     down          Virtual-Template2     Phase:0
```

Table 46 Description on the fields of the display fr map-info pppofr command

Field	Description
Fr Interface	Frame relay interface name
DLCI	DLCI number
Fr State	Frame relay state
PPP Interface	Name of the associated PPP virtual template interface
PPP Phase	Phase of the PPP session

display fr pvc-info

Syntax **display fr pvc-info** [**interface** *interface-type* { *interface-number* | *interface-number.subnumber* }] [*dlci-number*]

View Any view

Parameter **interface** *interface-type* { *interface-number* | *interface-number.subnumber* }: Specifies an interface by its type and number. It can be a main or subinterface. The *interface-type* argument is an interface type. The *interface-number* argument is a main interface number. The *subnumber* argument is a subinterface number, in the range 0 to 1023.

dlci-number: virtual circuit number of frame relay interface. It ranges from 16 to 1007.

Description Use the **display fr pvc-info** command to display state information on FR PVCs and statistics about data transmitted and received on them.

If the command is performed with no interface or DLCI specified, the displayed information covers all PVCs; if with an interface (a main interface or subinterface) specified, the displayed information covers only the PVCs on the interface; and if with a DLCI specified, the displayed information covers only the specified PVC.

Related command: **fr dlci**.

Example # Display the frame relay PVC table.

```
<Sysname> display fr pvc-info
PVC statistics for interface Serial2/0 (DTE, physical UP)
DLCI = 100, USAGE = UNUSED (0000), Serial2/0
create time = 2000/04/01 23:55:39, status = active
in BECN = 0, in FECN = 0
in packets = 0, in bytes = 0
out packets = 0, out bytes = 0
DLCI = 102, USAGE = LOCAL (0010), INTERFACE = Serial2/0.1
create time = 2000/04/01 23:56:14, status = active
in BECN = 0, in FECN = 0
in packets = 0, in bytes = 0
out packets = 0, out bytes = 0
```

Table 47 Description on the fields of the display fr pvc-info command

Field	Description
PVC statistics for interface Serial2/0 (DTE, physical UP)	Display information about PVCs on the frame relay interface Serial 2/0. The interface operates in as a DTE. The physical state of the interface is up.
DLCI = 100, USAGE = UNUSED (0000), INTERFACE = Serial2/0	DLCI 100 was assigned to the PVC through negotiation of LMI with DCE end. Its state is unused, and it belongs to interface Serial 2/0.
create time = 2000/04/01 23:55:39, status = active	Date and time creating the PVC and the state of the PVC
in BECN = 0, in FECN = 0	Received BECNs and FECNs
in packets = 0, in bytes = 0	Received frames and bytes
out packets = 0, out bytes = 0	Transmitted frames and bytes

display fr statistics

Syntax **display fr statistics** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number. This interface must be a main interface.

Description Use the **display fr statistics** command to display current frame relay statistics about received and transmitted packets for the specified or all interfaces.

You may use this command to check frame relay traffic statistics and diagnose problems.

Example # Display frame relay statistics about received and transmitted packets.

```
<Sysname> display fr statistics
Frame relay packet statistics for interface Serial2/0 (DTE)
in packets = 84, in bytes = 1333
out packets = 92, out bytes = 1217
discarded in packets = 13, discarded out packets = 0
Frame relay packet statistics for interface Serial2/0.1 (DCE)
in packets = 0, in bytes = 0
out packets = 0, out bytes = 0
discarded in packets = 0, discarded out packets = 0
```

Table 48 Description on the fields of the display fr statistics command

Field	Description
Frame relay packet statistics for interface Serial2/0 (DTE)	Display frame relay packet statistics for the interface Serial 2/0, which operates as a DTE.
in packets = 84, in bytes = 1333	Received packets and bytes
out packets = 92, out bytes = 1217	Transmitted packets and bytes
discarded in packets = 13, discarded out packets = 0	Dropped incoming/outgoing packets

display interface mfr

Syntax **display interface mfr** [*interface-number* | *interface-number.subnumber*]

View Any view

Parameter *interface-number*: MFR interface number, in the range 0 to 1023.

interface-number.subnumber: MFR subinterface number, of which, *interface-number* is the main interface number, and *subnumber* is subinterface number. The *subnumber* argument ranges from 0 to 1023.

Description Use the **display interface mfr** command to display the information about an MFR interface or an MFR sub-interface, including configuration, state, and packet statistics.

If you do not specify an MFR interface or an MFR sub-interface, this command displays the information about all the MFR interfaces.

Example # Display the configuration and status information about interface MFR4.

```
<Sysname> display interface mfr 4
MFR4 current state : UP
Line protocol current state : UP
Description : MFR4 Interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)
Internet Address is 12.12.12.2/16 Primary
Link layer protocol is FR IETF
  LMI DLCI is 0, LMI type is Q.933a, frame relay DTE
  LMI status enquiry sent 435, LMI status received 435
  LMI status timeout 0, LMI message discarded 0
Physical is MFR, baudrate: 2048000 bps
Output queue: (Urgent queue: Size/Length/Discards) 0/50/0
Output queue: (Protocol queue: Size/Length/Discards) 0/500/0
Output queue: (FIFO queuing: Size/Length/Discards) 0/75/0
Last 300 seconds input:  0 bytes/sec, 0 packets/sec
Last 300 seconds output:  0 bytes/sec, 0 packets/sec
     1058 packets input, 832389 bytes, 0 drops
     619 packets output, 828190 bytes, 0 drops
```

Table 49 Description on the fields of the display interface mfr command

Field	Description
MFR4 current state : UP	Physical layer state
Line protocol current state : UP	Link layer state
Description : MFR4 Interface	Interface description
The Maximum Transmit Unit is 1500	MTU
Internet Address is 12.12.12.2/16	IP address and mask
link-protocol is FR IETF	Link layer protocol
LMI DLCI is 0, LMI type is Q.933a, frame relay DTE	DLCI number used by LMI, LMI type, port type and operating mode

Table 49 Description on the fields of the display interface mfr command

Field	Description
LMI status enquiry sent 435, LMI status received 435	Transmitted and received LMI status enquiry messages
LMI status timeout 0, LMI message discarded 0	LMI timeout messages and dropped LMI messages
Physical is MFR	Physical interface is MFR
Output queue: (Urgent queue: Size/Length/Discards) 0/50/0	Statistics on the packets of the following interface output queues: ■ Urgent queue ■ Protocol queue ■ FIFO queue
Output queue: (Protocol queue: Size/Length/Discards) 0/500/0	
Output queue: (FIFO queuing: Size/Length/Discards) 0/75/0	
Last 300 seconds input: 0 bytes/sec, 0 packets/sec	Input rate of the interface within the last five minutes
Last 300 seconds output: 0 bytes/sec, 0 packets/sec	Output rate of the interface within the last five minutes
1058 packets input, 832389 bytes, 0 drops	Packets and bytes received on the interface and packets dropped as the result of full receive buffer
619 packets output, 828190 bytes, 0 drops	Packets and bytes transmitted on the interface and packets dropped as the result of full transmit buffer

display mfr

Syntax **display mfr** [**interface** *interface-type interface-number* | **verbose**]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

verbose: Displays detailed statistics information, including the number of controlling packets sent and received.

Description Use the **display mfr** command to display configuration and statistics information of multilink frame relay bundle and bundle link. If no bundle or bundle link is specified, information about all bundles and bundle links is displayed.

Example # Display configuration and state information about all frame relay bundles and frame relay bundle links.

```
<Sysname> display mfr
Bundle interface:MFR1, Bundle state = up,  Bundle class = A,
    fragment disabled, MFR bundle fragment size = 222
        original packet be assembled/fragmentized (in/out): 0/0
        dropped fragment (in/out): 0/0
    Bundle name = 2
    Bundle links:
    Serial2/0, PHY state = up, link state = up,  Link name : Serial2/0
```

Table 50 Description on the fields of the display mfr command

Field	Description
Bundle interface	Bundle interface
Bundle state	Operating state of the bundle interface.
Bundle class	Class A indicates if there is one bundle link is in up state, the bundle is flagged as up. Moreover, all bundle links should be tagged as down before the bundle is down.
fragment disabled	Indicates whether the fragment is disabled (disabled in this sample output)
MFR bundle fragment size	Maximum fragment size allowed by the FR link
Bundle name	Name of multilink frame relay bundle
Bundle links	Physical interfaces of the links in the bundle.
Serial2/0, PHY state = up, link state = up, Link name = Serial2/0	Physical interface on the bundle link, the operating state of the physical layer interface and link layer interface, the link name of the bundle link (corresponding name on the physical interface by default)

Display detailed state information about all frame relay bundle links.

```
<Sysname> display mfr verbose
Bundle interface:MFR1, Bundle state = up,  Bundle class = A,
    fragment enabled, MFR bundle fragment size = 222
        original packet be assembled/fragmentized (in/out): 0/0
        dropped fragment (in/out): 0/0
    Bundle name = 2
    Bundle links:
    LID : Serial2/0   Peer LID: Serial2/0
    Bound to MFR1(BID:2)
    Physical state: up, link state: up,
    Bundle link fragment size: 222,
    Bundle Link statistics:
        Hello(TX/RX):         10/10    Hello_ack(TX/RX):       10/10
        Add_link(TX/RX):      4/2    Add_link_ack(TX/RX):    2/1
        Add_link_rej(TX/RX):  0/0
        Remove_link(TX/RX):   0/0    Remove_link_ack(TX/RX):  0/0
        Pkts dropped(in/out): 0/0
        Timer: ACK  4, Hello  10
        Retry: Max  2, Current 0
        Cause code: none
    Bundle Link fragment statistics:
        Mfr fragment(in/out): 0/0
```

Table 51 Description on the fields of the display mfr verbose command

Field	Description
LID	Identifier of the bundle link (to be the name of corresponding physical interface by default)
Peer LID	Identifier of the peer bundle link (to be the name of corresponding physical interface by default).
Bound to MFR0 (BID:MFR0)	The bundle link is bound to MFR0 on the interface MFR
Physical state	Operating state of the physical interface.
link state	Operating state of the link protocol on the bundle link.
Bundle Link statistics:	Statistics about the packets on the bundle link.

Table 51 Description on the fields of the display mfr verbose command

Field	Description
Hello(TX/RX)	Number of the transmitted and received Hello messages. Hello messages are sent for maintaining link state.
Hello_ack(TX/RX)	Number of transmitted and received Hello acknowledgement messages. Hello_ack messages are sent notifying receipt of the Hello messages.
Add_link(TX/RX)	Number of transmitted and received Add_link messages. Add_link messages are sent notifying the peer that the local node is ready for processing frames.
Add_link_ack(TX/RX)	Number of transmitted and received Add_link acknowledgment messages. Add_link_ack messages are sent notifying receipt of the Add_link messages.
Add_link_rej(TX/RX)	Number of transmitted and received Add_link reject messages. Add_link_rej messages are sent notifying reject of the Add_link messages.
Remove_link(TX/RX)	Number of transmitted and received Remove_link messages. Remove_link messages are sent notifying removal of a link from the bundle.
Remove_link_ack(TX/RX)	Number of transmitted and received Remove_link_ack messages. Remove_link_ack messages are sent notifying receipt of the Remove_link messages.
Pkts dropped(in/out)	Number of dropped incoming and outgoing packets.
Timer: Ack 4	Time waiting for a Hello_ack message before a Hello message or an Add_link message (for initial synchronization) is retransmitted on the bundle link.
Hello 10	Intervals for sending Hello messages.
Retry: max 2	Maximum number of Hello or Add_link sending retries made when no Hello_ack or Add_link_ack is received on the bundle link.
Current 0	Number of retries
Cause code	Cause resulting in the current state of the bundle link.
Bundle Link fragment statistics	Fragment statistics on the bundle link

display x25 template

Syntax **display x25 template** [*name*]

View Any view

Parameter *Name*: Name of an X.25 template.

Description Use the **display x25 template** command to display the information of an X.25 template, including the configuration concerning X.25 and LAPB.

If you do not specify the *name* argument, this command displays the information of all the X.25 templates.

Related command: **x25 template**, **x25-template**.

Example # Display the configuration of the X.25 template named "vofr".

```
<Sysname> display x25 template vofr
  Template:vofr
    X25 parameters
      X121 address:none    Modulo:8
      Timers
        Idle:0 (second)  T10/T20:1  T11/T21:200  T12/T22:180  T13/T23:180
      Channels
        Incoming-only:disable  Two-way:1-1024  Outgoing-only:disable
      Window size
        In:2  Out:2
      Packet size
        In:128  Out:128
    LAPB parameters
      Modulo:8  K:7  N1:12056  N2:10
      Timers
        T1:3000  T2:1500  T3:0
```

Table 52 Description on t he fields of the display x25 template command

Field	Description
X25 parameters	X.25-related settings
X121 address	X.121 address
Modulo	Window modulo, which defaults to 8.
Timers	■ Idle: Maximum idle period of SVCs ■ T10/T20: Delay of the re-start/re-transmission timer ■ T11/T21: Delay of the call request transmission timer ■ T12/T22: Delay of the reset request transmission timer ■ T13/T23: Delay of the clear request transmission timer
Channels	■ Incoming-only: Channel range of incoming-only calls ■ Two-way: Two-way channel range ■ Outgoing-only: Channel range of outgoing-only calls
Window size	■ In: Receiving window size ■ Out: Transmitting window size
Packet size	■ In: Maximum X.25 packet size allowed for receiving ■ Out: Maximum X.25 packet size allowed for transmitting
LAPB parameters	LAPB-related settings
Modulo	Modulo for numbering LAPB frames
N1	Maximum packet size (in bytes) a DCE/DTE allows
N2	Maximum number of retries allowed for an DTE/DCE to transmit a packet
Timers	T1: Transmission timer T2: Receiving timer T3: Idle channel timer

fr compression frf9

Syntax **fr compression frf9**

undo fr compression

View Subinterface (point-to-point) view

Parameter None

Description Use the **fr compression frf9** command to enable FRF9 compression function.

Use the **undo fr compression** command to disable FRF9 compression function.

By default, frame relay compression function is disabled.

The system supports FRF.9 stac compression function, which groups messages into control messages and data messages. An control message is used for state negotiation between the two sides that have compression protocol enabled of a DLCI connection. FRF.9 data messages are exchanged only after the negotiation succeeds. The negotiation fails if the number of FRF.9 control messages sent exceeds. In this case, compression configuration cannot take effect.

Frame relay main interface is point-to-multipoint, but the subinterface includes two types: point-to-point and point-to-multipoint. Frame relay FRF.9 compression configuration differs depends on different types of interfaces. For a point-to-point frame relay subinterface, just use the **fr compression frf9** command to configure on the subinterface view and FRF.9 compression function is enabled. For a point-to-multipoint frame relay interface or subinterface, whether to perform FRF.9 compression is determined by the configuration to create static address mapping. Refer to "fr map ip" on page 396.

This command is only valid for data messages and IARP messages but not LMI messages.

Only when the frame relay packets type of the interface is IETF, can frame relay compression take effect. When this command is configured, the system will automatically change the packet type of the interface into IETF if the frame relay packets type of an interface is not IETF.

Example # Enable frame relay compression on the point-to-point frame relay subinterface Serial 2/1.1.

```
<Sysname> system-view
[Sysname] interface serial 2/1.1 p2p
[Sysname-Serial2/1.1] fr compression frf9
```

fr compression iphc

Syntax **fr compression iphc**

undo fr compression iphc

View Frame relay interface view

Parameter None

Description Use the **fr compression iphc** command to enable FRF.20 (FRF.20 IPHC) compression.

Use the **undo fr compression iphc** command to disable the function.

By default, the frame relay compression function is disabled.

The system supports frame relay FRF.20 IP Header Compression (IPHC) function that compresses IP header. This technology is used to transmit voice messages so as to save bandwidth, and data is transmitted with great efficiency and speed.

Messages are divided into control messages and data messages according to FRF.20. An control message is used for state negotiation between the two sides that have compression protocol enabled of a DLCI connection. FRF.20 data messages are exchanged only after the negotiation succeeds. The negotiation fails if the number of FRF.20 control messages sent exceeds. In this case, compression configuration cannot take effect. This command is only valid for RTP messages and TCP ACK messages.

You can specify FRF.20 (FRF.20 IPHC) compression function using either the **fr compression iphc** command or configuring static address mapping.

For detailed information about configuring static address mapping, refer to "fr map ip" on page 396.

Example # Configure the frame relay interface Serial 2/0 to adopt FRF.20 compression.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr compression iphc
```

fr dlci

Syntax **fr dlci** *dlci-number*

undo fr dlci [*dlci-number*]

View Interface view

Parameter *dlci-number*: Virtual circuit number allocated for the frame relay interface, in the range 16 to 1007. The range 0 to 15 and 1008 to 1023 are reserved for special purposes.

Description Use the **fr dlci** command to configure the virtual circuit for frame relay interface and enter the corresponding virtual circuit view on the frame relay.

Use the **undo fr dlci** command to cancel the configuration.

When the frame relay interface type is DCE or NNI, it is necessary to manually configure virtual circuit for interface (either main interface or subinterface). When the frame relay interface type is DTE, if the interface is main interface, the system will automatically configure the virtual circuit according to the peer device.

The virtual circuit number on the physical interface is unique.

Example # Assign a virtual circuit with DLCI 100 to frame relay interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr dlci 100
[Sysname-fr-dlci-Serial2/0-100]
```

fr dlci-switch

Syntax **fr dlci-switch** *in-dlci* **interface** *interface-type interface-number* **dlci** *out-dlci*

undo fr dlci-switch *in-dlci*

View Frame relay interface view, MFR interface view

Parameter *in-dlci*: DLCI in the packets received on the interface, in the range 16 to 1007.

interface *interface-type interface-number*: Specifies an interface by its type and number.

dlci *out-dlci*: DLCI in the sent packets. It is in the range 16 to 1007.

Description Use the **fr dlci-switch** command to configure a static route for frame relay PVC switching.

Use the **undo fr dlci-switch** command to delete a static route for frame relay PVC switching.

By default, no static route is configured for frame relay PVC switching.

Before the static route of frame relay PVC is configured, it is necessary to enable the frame relay PVC switching first by using the **fr switching** command.

The default type of the forwarding interface can be frame relay or MFR. You can however specify a tunnel interface for forwarding, if one has been configured, thus transmitting frame relay packets over IP networks.

Related command: **fr switching**.

Example # Configure a static route, allowing the packets on the link with DLCI of 100 on Serial 2/0 to be forwarded over the link with DLCI of 200 on interface Serial 2/1.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr dlci-switch 100 interface serial 2/1 dlci 200
```

Configure a static route, allowing the packets on the link with DLCI of 200 on Serial 2/1 to be forwarded over the link with DLCI of 300 on tunnel interface 4.

```
<Sysname> system-view
[Sysname] interface serial 2/1
[Sysname-Serial2/1] fr dlci-switch 200 interface tunnel 4 dlci 300
```

fr inarp

Syntax **fr inarp** [**ip** [*dlci-number*]]

undo fr inarp [**ip** [*dlci-number*]]

View Interface view

Parameter **ip**: Performs inverse address resolution for IP addresses.

dlci-number: Data link connection identifier number, that is, virtual circuit number, indicating that the inverse address resolution is performed for this DLCI number only, ranges from 16 to 1007.

Description Use the **fr inarp** command to enable the inverse address resolution of frame relay.

Use the **undo fr inarp** command to disable this function.

By default, system permits enabling the frame relay inverse address resolution.

When the frame relay sends data over the interface, it is necessary to map the network address to the DLCI numbers. Such a map can be specified manually or can be completed via the function of automatic inverse address resolution. Automatic inverse address resolution can be started by using the command.

If it is expected to enable the inverse address resolution function of all PVCs, the command without any parameters is adopted.

If it is expected to disable the inverse address resolution function of all PVCs, the command **undo** without any parameters is adopted.

If it is expected to enable the inverse address resolution function in the specified data link, the command with *dlci-number* parameter is adopted.

By default, inverse address resolution function is enabled on the interface, including the subinterface, so are the PVCs on the interface. In this case, use **undo fr inarp ip** *dlci-number* command to disable the address solution function on a virtual circuit. If you use **undo fr inarp** command to disable the address solution function on an interface, the function of all the virtual circuits on the interface is disabled but the **fr inarp ip** *dlci-number* command is used to enable address resolution function on a virtual circuit.

The **fr inarp** command configured on an FR main interface also applies to its subinterfaces.

Example # Enable InARP at all PVCs of the frame relay interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr inarp
```

fr interface-type

Syntax **fr interface-type { dce | dte | nni }**

undo fr interface-type

View Interface view

Parameter **dce**: Set the type of frame relay interface to DCE (Data Circuit-terminating Equipment).

dte: Set the type of frame relay interface to DTE (Data Terminal Equipment).

nni: Set the type of frame relay interface to NNI (Network-to-Network Interface).

Description Use the **fr interface-type** command to set the frame relay interface type.

Use the **undo fr interface-type** command to restore the default frame relay interface type.

By default, the frame relay interface type is DTE.

In frame relay, there are two communicating parties, namely, the user side and network side. The user side is called Data Terminal Equipment (DTE), and the network side is called Data Communications Equipment (DCE). In a frame relay network, the interface between the frame relay switches is Network-to-Network Interface (NNI), and the corresponding interface adopts the NNI operating view. If the device is used as frame relay switching, the frame relay interface should operate in the NNI view or DCE mode. The system supports the three modes.

While configuring the frame relay interface type as DCE or NNI, it is unnecessary to perform the **fr switching** command in the System view. Please note that this is different from the mainstream equipment in the communications field.

Example # Set the type of the frame relay interface Serial 2/0 to DCE.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] fr interface-type dce
```

fr iphc

Syntax **fr iphc** { **nonstandard** | **rtp-connections** *number1* | **tcp-connections** *number2* | **tcp-include** }

undo fr iphc { **nonstandard** | **rtp-connections** | **tcp-connections** | **tcp-include** }

View Frame relay interface view, MFR interface view

Parameter **nonstandard**: Nonstandard compatible compression format.

rtp-connections number1: The number of RTP compression connections, in the range 3 to 1000. By default, the number of RTP compression connections is 16.

tcp-connections number2: The number of TCP compression connections, in the range 3 to 256. By default, the number of TCP compression connections is 16.

tcp-include: Includes TCP header compression when performing RTP compression.

Description Use the **fr iphc** command to enable IP header compression function, including RTP/TCP header compression.

Use the **undo fr iphc** { **nonstandard | tcp-include** } command to disable this function.

Use the **undo fr iphc** { **rtp-connections | tcp-connections** } command to restore the default compression connection numbers of RTP and TCP.

By default, *number1* and *number2* are 16.

Related command: **fr map ip**, **fr compression iphc**.

Example # Configure the number of RTP compression connections as 200 on the frame relay Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] fr iphc rtp-connections 200
```

fr lmi n391dte

Syntax **fr lmi n391dte** *n391-value*

undo fr lmi n391dte

View Interface view

Parameter *n391-value*: The value of counter N391, ranges from 1 to 255.

Description Use the **fr lmi n391dte** command to configure N391 parameter at the DTE side.

Use the **undo fr lmi n391dte** command to restore the default.

By default, the parameter value is 6.

The DTE sends a Status-Enquiry packet at regular interval set by T391 to the DCE. There are two types of Status-Enquiry packets: link integrity authentication packet and link status enquiry packet. The N391 parameter defines the ratio of sending the two types of packets, that is, link integrity authentication packets: link status enquiry packets = (N391 - 1): 1.

Example # Set DTE as the operating mode of frame relay interface Serial 2/0, and the counter value of the PVC status to 10.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] link-protocol fr
[Sysname-Serial2/0] fr interface-type dte
[Sysname-Serial2/0] fr lmi n391dte 10
```

fr lmi n392dce

Syntax **fr lmi n392dce** *n392-value*

undo fr lmi n392dce

View Interface view

Parameter *n392-value*: The Error threshold, which ranges from 1 to 10.

Description Use the **fr lmi n392dce** command to set N392 parameter at the DCE side.

Use the **undo fr lmi n392dce** command to restore the default.

By default, the parameter value is 3.

The DCE requires the DTE to send a Status-Enquiry packet at regular interval (set by T392). If the DCE does not receive the Status-Enquiry packet within a period of time, the error counter on DCE increments by one. If the errors exceed the threshold, the DCE would consider the physical channels and all the DLCIs to be unavailable.

N392 and N393 together define the "error threshold". N393 defines the event number observed and N392 defines the error threshold of that number (N393). That is, if number of errors that occurred to the DCE reaches N392 in N393 events, DCE will consider the errors have reached the threshold and declare the physical channels and all DLCIs to be unavailable.

N392 should be less than N393.

Example # Set frame relay interface Serial 2/0 to operate in DCE mode and set N392 to 5 and N393 to 6.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] link-protocol fr
[Sysname-Serial2/0] fr interface-type dce
[Sysname-Serial2/0] fr lmi n392dce 5
[Sysname-Serial2/0] fr lmi n393dce 6
```

fr lmi n392dte

Syntax **fr lmi n392dte** *n392-value*

undo fr lmi n392dte

View Interface view

Parameter *n392-value*: The value of N392 parameter at the DTE side. It ranges from 1 to 10.

Description Use the **fr lmi n392dte** command to set N392 parameter at the DTE side.

Use the **undo fr lmi n392dte** command to restore the default.

By default, the parameter value is 3.

The DTE sends a Status-Enquiry packet at a regular interval to the DCE to inquire the link status. On receiving this packet, the DCE will immediately send a Status-Response packet. If the DTE does not receive the response packet in the specified time, it will record the error by adding 1 to the error count. If the errors exceed the threshold, the DTE will consider that the physical channels and all the DLCIs to be unavailable.

N392 and N393 together define the "error threshold". N393 indicates the event number observed and N392 indicates the error threshold of that number (N393). That is, if N392 errors occurred in N393 Status-Enquiry packets in the DTE, the DTE would consider that the error had exceeded the threshold and declare the physical channels and all DLCIs to be unavailable.

N392 at DTE side should be less than N393 at DTE side.

Example # Set the operation of frame relay interface Serial 2/0 as the DTE mode and set N392 to 5 and N393 to 6.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] link-protocol fr
[Sysname-Serial2/0] fr interface-type dce
[Sysname-Serial2/0] fr lmi n392dce 5
[Sysname-Serial2/0] fr lmi n393dce 6
```

fr lmi n393dce

Syntax **fr lmi n393dce** *n393-value*

undo fr lmi n393dce

View Interface view

Parameter *n393-value*: The value of N392 parameter at the DTE side. It ranges from 1 to 10.

Description Use the **fr lmi n393dce** command to set the N393 parameter at the DCE side.

Use the **undo fr lmi n393dce** command to restore the default.

By default, the parameter value is 4.

The DCE requires the DTE to send a Status-Enquiry packet at a regular interval (set by T392). If the DCE does not receive the Status-Enquiry packet, it will record the error by adding 1 to the error count. If the errors exceed the threshold, the DCE would consider the physical channels and all the DLCIs to be unavailable.

N392 and N393 together define the "error threshold". N393 defines the event number observed and N392 defines the error threshold of that number (N393). That is, if the number of errors that occur to the DCE reaches N392 in N393 events, DCE will consider the errors have reached the threshold and declare the physical channels and all DLCIs to be unavailable.

N392 at DCE side should be less than N393 at DCE side.

Example # Set the operation of frame relay interface Serial 2/0 as DCE mode and set N392 to 5 and N393 to 6.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] link-protocol fr
[Sysname-Serial2/0] fr interface-type dce
[Sysname-Serial2/0] fr lmi n392dce 5
[Sysname-Serial2/0] fr lmi n393dce 6
```

fr lmi n393dte

Syntax **fr lmi n393dte** *n393-value*

undo fr lmi n393dte

View Interface view

Parameter *n393-value*: The value of N393 parameter at the DTE side. It ranges from 1 to 10.

Description Use the **fr lmi n393dte** command to set N393 parameter at the DTE side.

Use the **undo fr lmi n393dte** command to restore the default.

By default, the parameter value is 4.

The DTE sends a Status-Enquiry packet at a regular interval to the DCE to inquire the link status. On receiving this packet, the DCE will immediately send a Status-Response packet. If the DTE does not receive the response packet in the specified time, it will record the error by adding 1 to the error count. If the errors exceed the threshold, the DTE will consider that the physical channels and all the DLCIs to be unavailable.

N392 and N393 together define the "error threshold". N393 indicates the event number observed and N392 indicates the error threshold of that number (N393). That is, if N392 errors occurred in N393 Status-Enquiry packets in the DTE, the DTE would consider that the error count had exceeded the threshold and declare the physical channels and all DLCIs to be unavailable.

N392 at DTE side should be less than N393 at DTE side.

Example # Set the operation of frame relay interface Serial 2/0 as the DTE mode and set N392 to 5 and N393 to 6.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] link-protocol fr
[Sysname-Serial2/0] fr interface-type dte
[Sysname-Serial2/0] fr lmi n392dte 5
[Sysname-Serial2/0] fr lmi n393dte 6
```

fr lmi t392dce

Syntax **fr lmi t392dce** *t392-value*

undo fr lmi t392dce

View Interface view

Parameter *t392-value*: Value of T392 at the DCE side. The range of the value is 5 to 30, in seconds.

Description Use the **fr lmi t392dce** command to set T392 parameter at the DCE side.

Use the **undo fr lmi t392dce** command to restore the default.

By default, the parameter value is 15 seconds.

This parameter defines the maximum time for DCE waiting for a Status-Enquiry.

T392 at DCE side should be greater than T391 at DTE side Use the **timer hold** command to configure the parameter value.

Example # Set the frame relay interface Serial 2/0 to operate in DCE mode and set T392 to 10s.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] link-protocol fr
[Sysname-Serial2/0] fr interface-type dce
[Sysname-Serial2/0] fr lmi t392dce 10
```

fr lmi type

Syntax **fr lmi type** { **ansi** | **nonstandard** | **q933a** } [**bi-direction**]

undo fr lmi type

View Interface view

Parameter **ansi**: Standard LMI protocol type of ANSI T1.617 Appendix D.

nonstandard: Nonstandard compatible LMI protocol type.

q933a: Standard LMI protocol type of Q.933 Appendix A.

bi-direction: Specifies to respond to status-enquiry messages from network side in frame relay DTE mode. The support of this keyword varies with device models.

Description Use the **fr lmi type** command to configure the frame relay LMI protocol type.

Use the **undo fr lmi type** command to restore the default.

By default, the LMI protocol type is q933a.

LMI protocol is used to maintain frame relay protocol PVC table, including notifying PVC increasing, detecting PVC deleting, monitoring PVC status changing and authenticating link integrity. The system usually supports three standard LMI protocols ITU-T Q.933 Appendix A, ANSI T1.617 Appendix D, and nonstandard-compatible LMI protocol.

The **bi-direction** keyword specifies the interface to respond to status enquiry messages form network side when operating in frame relay DTE mode. It does not enable frame relay network specifications of the network side and has no effect on frame relay DCE interfaces. Normally, this keyword is only needed when the current device is to communicate with routers that require bi-directional LMI, such as Motorola Vanguard 5.3 (or former versions).

Example # Set the frame relay LIMI type of Serial 2/0 to nonstandard compatible protocol.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr lmi type nonstandard
```

fr map ip

Syntax **fr map ip** { *ip-address* [*mask*] | **default** } *dlci-number* [**broadcast** | [**nonstandard** | **ietf**] | **compression** { **frf9** | **iphc** }]*

undo fr map ip { *ip-address* | **default** } *dlci-number*

View Interface view

Parameter *ip-address*: Peer IP address.

mask: Peer IP mask, used to create a subnet address mapping.

default: Creates a default mapping.

dlci-number: Local virtual circuit number, in the range 16 to 1007.

broadcast: Specifies if broadcast packets can be sent using the map.

nonstandard: The map adopts nonstandard compatible encapsulation format. In this case, only IPHC compression can be adopted. PVC groups does not support compression.

ietf: The map adopts IETF encapsulation format. In this case, only FRF9 and IPHC can be adopted. PVC groups does not support compression.

compression: Enables frame relay compression.

frf9: Adopts payload compression.

iphc: Adopts IP, UDP, or RTP header compression.

Description Use the **fr map ip** command to add an IP address map entry for frame relay.

Use the **undo fr map ip** command to remove an IP address map entry for frame relay.

By default, no static address map entry exists and InARP is enabled.

You can create an address map manually or by using InARP. InARP is suitable for a complex network where the remote router also supports InARP. When the number of remote hosts is small or when default routes exist, however, manual map creation is preferred.

Example # Create a static address map entry on interface Serial 2/0, where DLCI 50 is connected to the router with IP address 202.38.163.252.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr map ip 202.38.163.252 50
```

fr map ppp

Syntax **fr map ppp** *dlci-number* **interface virtual-template** *interface-number*

undo fr map ppp [*dlci-number*]

View Interface view

Parameter *dlci-number*: Specific DLCI number in the range of 16 to 1007.

virtual-template *interface-number*: Virtual template interface number in the range of 0 to 1023.

Description Use the **fr map ppp** command to map the frame relay DLCI (corresponds to an Frame Relay PVC) to a PPP link, so the PPPoFR link is established, and thus PPP packets can be sent/received on FR PVC. The configuration parameter of this PPP link is up to the parameters configured on the interface specified by **interface virtual-template** *interface-number*.

Use the **undo map ppp** command to cancel this map, and thus eliminates this PPPoFR link.

Related command: **interface virtual-template** on page 1759.

Example # Map DLCI 100 to PPP and establish PPPoFR link on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr map ppp 100 interface virtual-template 1
```

fr switch

Syntax **fr switch** *name* [**interface** *interface-type interface-number* **dlci** *dlci1* **interface** *interface-type interface-number* **dlci** *dlci2*]

undo fr switch *name*

View System view

Parameter *name*: Name of a PVC used for frame relay switching, a string of 1 to 30 characters.

interface *interface-type interface-number* **dlci** *dlci1*: DLCI number at one end of PVC as well as the type and number of its interface.

interface *interface-type interface-number* **dlci** *dlci2*: DLCI number at the peer end of PVC as well as the type and number of its interface.

Description Use the **fr switch** *name* **interface** *interface-type interface-number* **dlci** *dlci1* **interface** *interface-type interface-number* **dlci** *dlci2* command to create a PVC used for frame relay switching.

Use the **fr switch** name command to enter the established frame relay switching view.

Use the **undo fr switch** command to delete a specified PVC.

By default, there is no PVC used for frame relay switching.

The interface for forwarding packets can be either a frame relay interface or an MFR interface. If Tunnel interface is specified as the forwarding interface, frame relay packets over IP can thus be realized.

In frame relay switching view, the **shutdown/undo shutdown** operation can be executed on a PVC. Before you can enter frame relay switching view, the PVC must have existed.

Example # Create a PVC named pvc1 on the DCE serving as the switch, which is from the DLCI 100 of serial interface 2/0 to the DLCI 200 of serial interface 2/1.

```
<Sysname> system-view
[Sysname] fr switching
[Sysname] fr switch pvc1 interface serial 2/0 dlci 100 interface ser
ial 2/1 dlci 200
[Sysname-fr-switching-pvc1]
```

fr switching

Syntax **fr switching**

undo fr switching

View System view

Parameter None

Description Use the **fr switching** command to enable frame relay PVC switching.

Use the **undo fr switching** command to disable frame relay PVC switching.

By default, frame relay switching is disabled.

Example # Enable PVC switching.

```
<Sysname> system-view
[Sysname] fr switching
```

interface mfr

Syntax **interface mfr** { *interface-number* | *interface-number.subnumber* }

undo interface mfr { *interface-number* | *interface-number.subnumber* }

View System view

Parameter *interface-number*: MFR interface number, in the range 0 to 1023.

interface-number.subnumber: MFR subinterface number, of which, *interface-number* is the main interface number, and *subnumber* is subinterface number. The *subnumber* argument ranges from 0 to 1023.

Description Use the **interface mfr** command to create a multilink frame relay bundle interface or subinterface and enter the corresponding interface view.

Use the **undo interface mfr** command to delete a specified multilink frame relay bundle interface or subinterface.

By default, there is no multilink frame relay interface or subinterface.

Before an MFR subinterface is created, the MFR interface must be created first.

Before using the **undo interface mfr** command to delete an MFR interface, you must delete all physical interfaces from the MFR interface.

For MFR interface, if there is one bundle link is in up state, the MFR physical state is up. Moreover, all bundle links should be tagged as down before the bundle is down. The link layer protocol on MFR interface is determined by LMI packet negotiation.

Example # Create a multilink frame relay bundle interface MFR4 with a point-to-multipoint subinterface.

```
<Sysname> system-view
[Sysname] interface mfr 4
[Sysname-MFR4] quit
[Sysname] interface mfr 4.1
[Sysname-MFR4.1]
```

interface serial

Syntax **interface serial** *interface-number.subnumber* [**p2p** | **p2mp**]

undo interface serial *interface-number.subnumber*

View System view

Parameter *interface-number*: Main interface number.

subnumber: Subinterface number, in the range 0 to 1023.

p2p: Specifies a point-to-point subinterface.

p2mp: Specifies a point-to-multipoint subinterface.

Description Use the **interface serial** command to create subinterface and enter subinterface view.

Use the **undo interface serial** command to delete subinterface.

Frame relay subinterface type defaults to **p2mp**.

Example # Configure a point-to-point subinterface Serial 2/0.2.

```
<Sysname> system-view
[Sysname] interface serial2/0.2 p2p
[Sysname-Serial2/0.2]
```

link-protocol fr

Syntax **link-protocol fr** [**ietf** | **nonstandard**]

View Interface view

Parameter **ietf**: Internet Engineering Task Force (IETF) standard encapsulation format (default).

nonstandard: Nonstandard compatible encapsulation format.

Description Use the **link-protocol fr** command to encapsulate interface link layer protocol as frame relay.

By default, the link-layer protocol encapsulated on the interface is PPP.

The frame relay encapsulation can be either **ietf** or **nonstandard**. IETF encapsulation conforms to RFC 1490, that is, it supports the IETF standard and is compatible with dedicated encapsulation format of mainstream routers.

If you encapsulate a frame relay interface using any of the above frame relay formats, the packets are encapsulated in the corresponding frame relay format before they are forwarded through the interface. That is, two devices can communicate with each other if the interfaces of both sides can recognize packets in both of the formats even if they are encapsulated using different frame relay formats. If an interface on one side cannot recognize packets of both formats, you need to encapsulate the two interfaces using the same frame relay format.

Example # Configure frame relay encapsulation on interface Serial 2/0 and select the nonstandard encapsulation compatible format.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol fr nonstandard
```

link-protocol fr mfr

Syntax **link-protocol fr mfr** *interface-number*

View Interface view

Parameter *interface-number*: MFR interface number, in the range 0 to 1023.

Description Use the **link-protocol fr mfr** command to configure the current physical interface as an MFR bundle link and bind it to an MFR interface.

By default, an interface is not bound to any MFR interface.

Note that:

- When this command is configured, the specified MFR interface must exist. A maximum of 16 physical interfaces can be bundled onto an MFR interface.
- To delete a physical interface from an MFR interface, use the **link-protocol** command to apply a link layer protocol of non frame relay MFR to the interface.
- After a physical interface is encapsulated as MFR format, the interface belongs to MFR and is not allowed to be configured using the commands related to FR except MFR. In addition, the queue type on the interface can be configured as FIFO (first in first out) only even if the other queue types have been encapsulated on the interface, they would be converted to FIFO type by force.

Example # Configure Serial 2/0 as a bundle link and add it onto the Frame Relay bundle interface MFR4.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol fr mfr 4
```

mfr bundle-name

Syntax **mfr bundle-name** [*name*]

undo mfr bundle-name

View MFR interface view

Parameter *name*: Bundle identification, a string of 1 to 49 characters.

Description Use the **mfr bundle-name** command to set frame relay bundle identification (BID).

Use the **undo mfr bundle-name** command to restore the default.

By default, BID is represented by mfr plus frame relay bundle number, for example, mfr4.

Each MFR bundle has a BID, which only has local significance. Therefore, the same BID can be used at both ends of the link.

Note that:

- In spite of the default BID, you cannot configure a BID as a string in the form of **mfr** + number.
- After changing the BID of an MFR interface, you must execute the **shutdown** and **undo shutdown** command on the interface to validate the new BID.

Example # Set the frame relay link MFR4 BID to bundle1.

```
<Sysname> system-view
[Sysname] interface mfr 4
[Sysname-MFR4] mfr bundle-name bundle1
```

mfr fragment

Syntax **mfr fragment**

undo mfr fragment

View MFR interface view

Parameter None

Description Use the **mfr fragment** command to enable fragmentation on the MFR bundle.

Use the **undo mfr fragment** command to disable the function.

By default, fragmentation is disabled on the MFR bundle.

Example # Enable fragmentation on interface MFR 4.

```
<Sysname> system-view
[Sysname] interface mfr 4
[Sysname-MFR4] mfr fragment
```

mfr fragment-size

Syntax **mfr fragment-size** *bytes*

undo mfr fragment-size

View Frame relay interface view and MFR interface view

Parameter *bytes*: Fragment size, ranging from 60 to 1,500 in bytes.

Description Use the **mfr fragment-size** command to configure the maximum fragment size allowed on a frame relay bundle link.

Use the **undo mfr fragment-size** command to restore the default.

By default, the maximum fragment size allowed on a frame relay bundle link is of 300 bytes.

The bundle link executes the priority of the fragment size configured on the frame relay interface view after the fragmentation is enabled on MFR interface. If the frame relay interface view is not configured with fragment size, use the fragment size configured on MFR interface view. The priority of the fragment size configured in frame relay interface view is higher than that of the one configured in MFR interface view.

Example # Configure the maximum fragment size allowed on the multilink frame relay bundle link Serial 2/0 to be 70 bytes.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] mfr fragment-size 70
```

mfr link-name

Syntax **mfr link-name** [*name*]

undo mfr link-name [*name*]

View Frame relay interface view

Parameter *name*: Name of a bundle link identification, a string of 1 to 49 characters.

Description Use the **mfr link-name** command to set the frame relay bundle link identification (LID).

Use the **undo mfr link-name** command to restore the default.

By default, LID is the name of the corresponding physical interface.

Use the **link-protocol fr mfr** command to configure the current physical interface as a multilink frame relay bundle link before using the **mfr link-name** command to configure. The peer equipment identifies a frame relay bundle link via LID or associates the bundle link with a frame relay bundle by using LID. LID is locally valid; therefore, the LIDs at both ends of a link can be the same.

When changing the bundle LID on an interface, you must execute the **shutdown/undo shutdown** command on the interface to make the new bundle LID valid.

Example # Set the bundle LID of the multilink frame relay bundle link Serial 2/0 to be bl1.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] mfr link-name bl1
```

mfr retry

Syntax **mfr retry** *number*

undo mfr retry

View Frame relay interface view

Parameter *number*: The maximum times that a bundle link can resend hello messages, in the range 1 to 5.

Description Use the **mfr retry** command to set the maximum times that a frame relay bundle link can resend hello message when waiting for a hello acknowledgement message.

Use the **undo mfr retry** command to restore the default.

By default, the maximum times that a frame relay bundle link can resend hello message is twice.

The bundle link sustains link status by periodically sending hello message to the peer end. If the times that a bundle link resends hello message reach the maximum without receiving acknowledgement from the peer, the system will regard the link protocol on the bundle link to be malfunctioning.

Only after the **link-protocol fr mfr** command is used to associate a frame relay bundle link interface with a frame relay bundle, can this command be configured.

Example # Set the bundle link Serial 2/0 to resend hello message for 3 times at most.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] mfr retry 3
```

mfr stateup-respond-addlink

Syntax **mfr stateup-respond-addlink**

undo mfr stateup-respond-addlink

View System view

Parameter None

Description Use the **mfr stateup-respond-addlink** command to configure an MFR interface to return ADD_LINK messages and transit the corresponding physical interface to the protocol ADD_SENT state when it is in protocol up state and receives an ADD_LINK request from the peer.

Use the **undo mfr stateup-respond-addlink** command to restore the default.

By default, an MFR interface does not respond to ADD_LINK requests received even if it is in protocol up state. This causes the peer port cannot be in protocol up state.

Example # Configure the MFR interface to return ADD_LINK messages and transit the corresponding physical interface to the protocol ADD_SENT state when it is in protocol up state and receives an ADD_LINK request from the peer.

```
<Sysname> system-view
[Sysname] mfr stateup-respond-addlink
```

mfr timer ack

Syntax **mfr timer ack** *seconds*

undo mfr timer ack

View Frame relay interface view

Parameter *seconds*: Time (in seconds) of waiting for hello acknowledgment message before resending hello message, in the range 1 to 10.

Description Use the **mfr timer ack** command to set the time of waiting for hello acknowledgment message before frame relay bundle link resends hello message.

Use the **undo mfr timer ack** command to restore the default.

By default, time of waiting for hello acknowledgment message before resending hello message is 4 seconds.

The bundle link sustains link status by periodically sending hello message to the peer end. If the times that a bundle link resends hello message reach the maximum without receiving acknowledgement from the peer, the system will regard the link protocol on the bundle link to be malfunctioning.

Only after the **link-protocol fr mfr** command is used to associate a frame relay bundle link interface with a frame relay bundle, can this command be configured.

Related command: **mfr timer hello**, **mfr retry**.

Example # Set the frame relay bundle link Serial 2/0 to wait for six seconds before resending hello message.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] mfr timer ack 6
```

mfr timer hello

Syntax **mfr timer hello** *seconds*

undo mfr timer hello

View Frame relay interface view

Parameter *seconds*: Interval (in seconds) for a bundle link to send hello message, in the range 1 to 180.

Description Use the **mfr timer hello** command to set the interval for a frame relay bundle link to send hello message.

Use the **undo mfr timer hello** command to restore the default.

By default, the interval for a frame relay bundle link to send hello message is 10 seconds.

Only after the **link-protocol fr mfr** command is used to associate a frame relay bundle link interface with a frame relay bundle, can this command be configured.

Example # Set the bundle link Serial 2/0 to send hello message once every 15 seconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] mfr timer hello 15
```

mfr window-size

Syntax **mfr window-size** *number*

undo mfr window-size

View MFR interface view

Parameter *number*: Number of fragments, in the range 1 to 16.

Description Use the **mfr window-size** command to configure the number of fragments that can be hold by the window used in sliding window algorithm when multilink frame relay reassembles received fragments.

Use the **undo mfr window-size** command to restore the default.

By default, the size of a sliding window is equal to the number of physical interfaces of an MFR bundle.

Example # Set the size of the sliding window of the MFR bundle interface MFR4 to be 8.

```
<Sysname> system-view
[Sysname] interface mfr 4
[Sysname-MFR4] mfr window-size 8
```

shutdown

Syntax **shutdown**

undo shutdown

View Frame relay switching view

Parameter None

Description Use the **shutdown** command to disable the current switching PVC.

Use the **undo shutdown** command to enable the current switching PVC.

By default, the switching PVC is enabled.

Example # Create a PVC named pvc1 on the DCE serving as the switch, which is from the DLCI 100 of Serial 2/0 to the DLCI 200 of Serial 2/1 and disable the current switching PVC.

```
<Sysname> system-view
[Sysname] fr switching
[Sysname] fr switch pvc1 interface serial 2/0 dlci 100 interface ser
ial 2/1 dlci 200
[Sysname-fr-switching-pvc1] shutdown
```

reset fr inarp

Syntax **reset fr inarp**

View User view

Parameter None

Description Use the **reset fr inarp** command to clear the address mapping established by inverse ARP.

In some special cases, for example, when the network architecture changes, the dynamic address maps originally established will become invalid. Hence it is necessary to establish them again. Users can use this command to clear all the dynamic address maps.

Related command: **fr inarp**.

Example # Clear all the frame relay dynamic address maps.

```
<Sysname> reset fr inarp
```

reset fr pvc

Syntax **reset fr pvc interface serial** *interface-number* [**dlci** *dlci-number*]

View User view

Parameter *interface-number*: Interface number.

dlci *dlci-number*: DLCI assigned to an FR interface. The *dlci-number* argument is in the range 16 to 1007. Note that DLCI 0 through 15 and 1008 through 1023 are reserved for special use and are thus unavailable.

Description Use the **reset fr pvc** command to clear the statistics on a PVC.

Example # Clear PVC statistics on Serial 2/0.

```
<Sysname> reset fr pvc interface serial 2/0
```

timer hold

Syntax **timer hold** *seconds*

undo timer hold

View Interface view

Parameter *seconds*: Value of T391 parameter at DTE side, which ranges from 0 to 32767 in seconds. 0 indicates that the LMI protocol is disabled.

Description Use the **timer hold** command to configure T391 parameter at the DTE side.

Use the **undo timer hold** command to restore the default.

By default, the parameter is 10 seconds.

The parameter is a time variable that defines the interval of Status-Enquiry packet sent by DTE.

Related command: **fr lmi t392dce**.

Example # Configure that frame relay interface Serial 2/0 to operate in DTE mode, and set the value of T391 parameter to 15 seconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol fr
```

```
[Sysname-Serial2/0] fr interface-type dte
[Sysname-Serial2/0] timer hold 15
```

x25-template

Syntax **x25-template** *name*

undo x25-template *name*

View DLCI interface view

Parameter *Name*: Name of an X.25 template, a string of 1 to 30 characters.

Description Use the **x25-template** command to apply an X.25 template to a VC.

Use the **undo x25-template** command to remove the X.25 template applied to a VC.

Annex G implements X.25 over FR. You can configure X.25 parameters for an X.25 over FR DLCI using the **x25 template** command and apply the template in DLCI interface view.

Example # Apply the X.25 template named "vofr" to DLCI 100.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] fr dlci 100
[Sysname-fr-dlci-Serial2/0-100] x25-template vofr
```

x25 template

Syntax **x25 template** *name*

undo x25 template *name*

View System view

Parameter *Name*: Name of an X.25 template, a string of 1 to 30 characters.

Description Use the **x25 template** command to create an X.25 template or enter X.25 template view.

Use the **undo x25 template** command to remove an X.25 template.

As for the **x25 template** command, if the X.25 template identified by the *name* argument already exists, this command leads you to X.25 template view. X.25-/LAPB-related parameters are configured in X.25 template view.

Example # Create an X.25 template named "vofr".

```
<Sysname> system-view
[Sysname] x25 template vofr
[Sysname-x25-vofr]
```

23 GARP CONFIGURATION COMMANDS

display garp statistics

Syntax **display garp statistics** [**interface** *interface-list*]

View Any view

Parameter **interface** *interface-list*: Specifies an Ethernet port list, in the format of { *interface-type interface-number* [**to** *interface-type interface-number*] }&<1-10>, where &<1-10> indicates that you can specify up to 10 port ranges. A port range defined without the **to** *interface-type interface-number* portion comprises only one port.

Description Use the **display garp statistics** command to display the GARP statistics of the specified or all ports.

Note that:

- If the **interface** *interface-list* keyword-argument combination is not specified, this command displays the GARP statistics of all the ports.
- If the **interface** *interface-list* keyword-argument combination is specified, this command displays the GARP statistics of the specified ports.

Example # Display statistics about GARP for port Ethernet 1/0.

```
<Sysname> display garp statistics interface ethernet1/0
        GARP statistics on port Ethernet1/0

        Number of GVRP Frames Received          : 0
        Number of GVRP Frames Transmitted       : 0
        Number of Frames Discarded              : 0
```

display garp timer

Syntax **display garp timer** [**interface** *interface-list*]

View Any view

Parameter **interface** *interface-list*: Specifies an Ethernet port list, in the format of { *interface-type interface-number* [**to** *interface-type interface-number*] }&<1-10>, where &<1-10> indicates that you can specify up to 10 port ranges. A port range

defined without the **to** *interface-type interface-number* portion comprises only one port.

Description Use the **display garp timer** command to display GARP timers.

Note that:

- If the **interface** *interface-list* keyword-argument combination is not specified, this command displays the GARP timer settings of all the ports.
- If the **interface** *interface-list* keyword-argument combination is specified, this command displays the GARP timer settings of the specified ports.

Related command: **garp timer**, **garp timer leaveall**.

Example # Display GARP timers on port Ethernet 1/0.

```
<Sysname> display garp timer interface ethernet 1/0
        GARP timers on port Ethernet1/0

                Garp Join Time          : 20 centiseconds
                Garp Leave Time         : 60 centiseconds
                Garp LeaveAll Time      : 1000 centiseconds
                Garp Hold Time          : 10 centiseconds
```

garp timer

Syntax **garp timer** { **hold** | **join** | **leave** } *timer-value*

undo garp timer { **hold** | **join** | **leave** }

View Ethernet interface view, port group view

Parameter **hold**: Sets the hold timer.

join: Sets the join timer.

leave: Sets the leave timer.

timer-value: Timer setting (in centiseconds), which must be a multiple of 5.

Description Use the **garp timer** command to set a GARP timer for an Ethernet port or all ports in a port group in compliance with the timer setting dependencies shown in Table 53.

Use the **undo garp timer** command to restore the default of a GARP timer. This may fail if the default does not satisfy the dependencies shown in Table 53.

By default, the hold timer, the join timer, and the leave timer are set to 10 centiseconds, 20 centiseconds, and 60 centiseconds.

When restoring the default GARP timers, you are recommended to do that on the timers in the order of hold, join, leave, and leaveall.

When configuring GARP timers, note that their values are dependent on each other and must be a multiplier of five centiseconds. If the value range for a timer is not desired, you may change it by tuning the value of another timer as shown in the following table:

Table 53 Dependencies of GARP timers

Timer	Lower limit	Upper limit
Hold	10 centiseconds	Not greater than half of the join timer setting
Join	Not less than two times the hold timer setting	Less than half of the leave timer setting
Leave	Greater than two times the join timer setting	Less than the leaveall timer setting
Leaveall	Greater than the leave timer setting	32765 centiseconds

Related command: **display garp timer**.

Example # Set the GARP join timer to 25 centiseconds, assuming that both the hold timer and the leave timer are using the default.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] garp timer join 25
```

garp timer leaveall

Syntax **garp timer leaveall** *timer-value*

undo garp timer leaveall

View System view

Parameter *timer-value*: Leaveall timer setting, in the range 65 to 32765 (in centiseconds). Note that the setting of the leaveall timer must be a multiple of 5 and must be greater than the leave timer settings of all the ports.

Description Use the **garp timer leaveall** command to set the leaveall timer of GARP.

Use the **undo garp timer leaveall** command to restore the default. This may fail if the default is less than the setting of the current leave timer.

By default, the setting of the leaveall timer is 1000 centiseconds (that is, 10 seconds).

A leaveall timer starts upon the start of a GARP application entity. When this timer expires, the entity sends a LeaveAll message so that other entities can re-register its attribute information and starts another leaveall timer at the same time.

Each time a device on the network receives a LeaveAll message, it resets its leaveall timer. Therefore, a GARP application entity may send LeaveAll messages at the interval set by its leaveall timer or the leaveall timer on another device on the network, whichever is smaller.

Related command: **display garp timer**.

Example # Set the leaveall timer to 100 centiseconds, assuming that the leave timer is 60 centiseconds.

```
<Sysname> system-view
[Sysname] garp timer leaveall 100
```

reset garp statistics

Syntax **reset garp statistics** [**interface** *interface-list*]

View User view

Parameter **interface** *interface-list*: Specifies an Ethernet port list, in the format of { *interface-type interface-number* [**to** *interface-type interface-number*] }&<1-10>, where &<1-10> indicates that you can specify up to 10 port ranges. A port range defined without the **to** *interface-type interface-number* portion comprises only one port.

Description Use the **reset garp statistics** command to clear GARP statistics of the specified or all ports.

Note that:

- If the **interface** *interface-list* keyword-argument combination is not specified, this command clears the GARP statistics of all the ports.
- If the **interface** *interface-list* keyword-argument combination is specified, this command clears the GARP statistics of the specified ports.

Related command: **display gvrp statistics**.

Example # Clear statistics about GARP on all ports.

```
<Sysname> reset garp statistics
```

24 GVRP CONFIGURATION COMMANDS

display gvrp statistics

Syntax **display gvrp statistics** [**interface** *interface-list*]

View Any view

Parameter **interface** *interface-list*: Specifies an Ethernet port list, in the format of { *interface-type interface-number* [**to** *interface-type interface-number*] }&<1-10>, where &<1-10> indicates that you can specify up to 10 port ranges. A port range defined without the **to** *interface-type interface-number* portion comprises only one port.

Description Use the **display gvrp statistics** command to display GVRP statistics of the specified or all trunk ports.

Note that if the **interface** *interface-list* is not provided, the GVRP statistics of all trunk ports will be displayed. Otherwise, only the GVRP statistics of all the specified trunk port will be displayed.

Example # Display statistics about GVRP for trunk port Ethernet 1/0.

```
<Sysname> display gvrp statistics interface ethernet 1/0
        GVRP statistics on port Ethernet1/0

                GVRP Status                     : Enabled
                GVRP Running                    : YES
                GVRP Failed Registrations       : 0
                GVRP Last Pdu Origin            : 0000-0000-0000
                GVRP Registration Type          : Normal
```

Table 54 Description on the fields of the display gvrp statistics command

Field	Description
GVRP Status	Indicates whether GVRP is enabled or disabled.
GVRP Running	Indicates whether GVRP is running.
GVRP Failed Registrations	Indicates the number of GVRP registration failures.
GVRP Last Pdu Origin	Indicates the source MAC address in the last GVRP PDU.
GVRP Registration Type	Indicates the GVRP registration type on the port.

display gvrp status

Syntax **display gvrp status**

View Any view

Parameter None

Description Use the **display gvrp status** command to display the global enable/disable state of GVRP.

Example # Display the global GVRP enable/disable state.

```
<Sysname> display gvrp status
GVRP is enabled
```

gvrp

Syntax **gvrp**

undo gvrp

View System view, Ethernet interface view, port group view

Parameter None

Description Use the **gvrp** command to enable GVRP.

Use the **undo gvrp** command to disable GVRP.

Disabling GVRP globally also disables it on all ports.

By default, GVRP is disabled.

Configured in system view, the setting is globally effective; configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group.

- *To enable GVRP on a port, you need to enable it globally.*
- *The port where you enable/disable GVRP must be a trunk port.*

Related command: **display gvrp status**.

Example # Enable GVRP globally.

```
<Sysname> system-view
[Sysname] gvrp
GVRP is enabled globally.
```

gvrp registration

Syntax **gvrp registration** { **fixed** | **forbidden** | **normal** }

undo gvrp registration

View Ethernet interface view, port group view

Parameter **fixed**: Sets the registration type to fixed.

forbidden: Sets the registration type to forbidden.

normal: Sets the registration type to normal.

Description Use the **gvrp registration** command to configure the GVRP registration type on a port.

Use the **undo gvrp registration** command to restore the default.

The default GVRP registration type is normal.

Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group.

GVRP provides the following three registration types on a port:

- Normal -- Enables the port to dynamically register/deregister VLANs, and to propagate both dynamic and static VLAN information.
- Fixed -- Disables the port to dynamically register and deregister VLANs or propagate information about dynamic VLANs, but allows the port to propagate information about static VLANs. A trunk port with fixed registration type thus allows only manually configured VLANs to pass through even though it is configured to carry all VLANs.
- Forbidden -- Disables the port to dynamically register and deregister VLANs, and to propagate VLAN information except information about VLAN 1. A trunk port with forbidden registration type thus allows only VLAN 1 to pass through even though it is configured to carry all VLANs.

Note that this command is only available on trunk ports.

Related command: **display garp statistics**.

Example # Set the GVRP registration type to fixed on port Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port link-type trunk
[Sysname-Ethernet1/0] gvrp registration fixed
```

25 HDLC CONFIGURATION COMMANDS

link-protocol hdlc

Syntax **link-protocol hdlc**

View Interface view

Parameter None

Description Use the **link-protocol hdlc** command to configure HDLC encapsulation on the interface.

As a data link layer protocol, HDLC can carry network layer protocols, such as IP and IPX.

By default, PPP encapsulation is configured on an interface.

Related command: **timer hold**

Example # Configure HDLC encapsulation on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol hdlc
```

timer hold

Syntax **timer hold** *seconds*

undo timer hold

View Interface view

Parameter *seconds*: Link status polling interval (in seconds), in the range 0 to 32767.

Description Use the **timer hold** command to set the polling interval.

Use the **undo timer hold** command to restore the default.

By default, the link status polling interval is 10 seconds on the interface.

You should set the same polling interval on both the local and remote devices. Setting it to zero disables link status check.

Example # Set the link status polling interval to 100 seconds on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] timer hold 100
```

26 LAPB AND X.25 CONFIGURATION COMMANDS

channel

Syntax **channel** { **interface** *interface-type interface-number* [**dlci** *dlci-number*] | **xot** *ip-address* }

undo channel { **interface** *interface-type interface-number* | **xot** *ip-address* }

View X.25 hunt group view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

dlci *dlci-number*: Specifies an FR DLCI. The *dlci-number* argument is in the range of 16 to 1007.

xot *ip-address*: Specifies the IP address of the peer XOT host.

Description Use the **channel** command to add an X.25 interface, Annex G DLCI or XOT channel to the current hunt group.

Use the **undo channel** command to remove the specified interface, Annex G DLCI or XOT channel from the current hunt group.

Related command: **x25 hunt-group**.

Example # Add serial2/0 to the hunt group hg1.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol x25
[Sysname-Serial2/0] x25 x121-address 1111
[Sysname-Serial2/0] quit
[Sysname] x25 hunt-group hg1 round-robin
[Sysname-hg-hg1] channel interface serial 2/0
```

Add Annex DLCI 100 to the hunt group hg1.

```
<Sysname> system-view
[Sysname] interface serial 2/1
[Sysname-Serial2/1] link-protocol fr
[Sysname-Serial2/1] fr dlci 100
[Sysname-fr-dlci-Serial2/1-100] annexg dce
[Sysname-fr-dlci-Serial2/1-100] quit
```

```
[Sysname-Serial2/1] quit
[Sysname] x25 hunt-group hg1 round-robin
[Sysname-hg-hg1] channel interface serial 2/1 dlci 100
```

Add the XOT channel with a destination of 10.1.1.2 to hunt group hg1.

```
<Sysname> system-view
[Sysname] x25 hunt-group hg1 round-robin
[Sysname-hg-hg1] channel xot 10.1.1.2
```

display interface

Syntax **display interface** [*interface-type* [*interface-number*]]

View Any view

Parameter *interface-type* [*interface-number*]: Specifies an interface by its type and number.

Description Use the **display interface** command to view the interface information.

Example # Encapsulate Serial2/0 with X.25 protocol and view the interface information.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] link-protocol x25 dce
[Sysname-Serial2/0] display interface serial 2/0
Serial2/0 current state: UP
Line protocol current state: UP
Description: Serial2/0 Interface

Output:210 packets, 4720 bytes
        0 errors, 0 underruns, 0 collisions
        0 deferred
DCD=UP  DTR=UP  DSR=UP  RTS=UP  CTS=UP
```

Table 55 Description on the fields of the display interface command

Field	Description
Link-protocol is X.25 DCE Ietf	Current encapsulation protocol of this interface is X.25 protocol that works in DCE mode, and the data packet encapsulation format is IETF.
address is	X.121 address of this X.25 interface; this field will be empty if there is no address.
state	Current status of this X.25 interface.
modulo	Data packets and traffic control packets sent by this X.25 interface are numbered in modulo 8 mode.
window sizes input:2 output:2, packet sizes input:128 output:128	Flow control parameters of this X.25 interface, including receiving window size, sending window size, maximum received packet size (in bytes), and maximum sent packet size (in bytes).
Channels: Incoming-only 0-0, Two-way 1-1024, Outgoing-only 0-0	Channel range division of this X.25 interface, sequentially as incoming-only channel section, two-way channel section, outgoing-only channel section; if both demarcating values of an section are 0, this section is disabled.
Timers: T20 180, T21 200, T22 180, T23 180, T28 300, Idle_Timer 0 <seconds>	Delay values of various timers of this X.25 interface, in seconds
New Configuration:	New configuration of this X.25 interface taking effect after next restart; if this configuration is wrong, the default value will be restored
Restarts 0 (Restart Collisions 0)	Statistics of this X.25 interface, including times of restart (including restart collision)
Refused Incoming Call	Statistics information of this X.25 interface: times of call refusals
Failing Outgoing Call	Statistics information of this X.25 interface: Number of failed outgoing calls.
input/output: RESTART 1/1 ... REJ 0/0	Statistics information of this X.25 interface: quantities of received and sent packets, format: received quantity/sent quantity.
Invalid Pr	Error statistics information of this X.25 interface: total of received data packets and traffic control packets carrying erroneous acknowledgement numbers.
Invalid Ps	Error statistics information of this X.25 interface: total of received data packets carrying erroneous sequence numbers.
Unknown	Error statistics information of this X.25 interface: total of received irresolvable packets.
Link-protocol is LAPB	Current encapsulation protocol of this interface is LAPB protocol.
LAPB DCE:	LAPB of this interface works in DCE mode.
module 8	Information frame and monitoring frame sent by this interface LAPB are numbered in the modulo 8 view.

Table 55 Description on the fields of the display interface command

Field	Description
window-size 7	Window size of this interface LAPB is 7.
max-frame 12056	The maximum length of frame sent by the interface LAPB is 12056 bits.
retry 10	Maximum re-sending times of information frame of this interface LAPB is 10.
timer	Delay value of timers of this interface LAPB, in milliseconds. The unit of T3 is second.
state	Current status of this interface LAPB.
VS	Sending variable of this interface LAPB.
VR	Receiving variable of this interface LAPB.
Remote VR	Peer's last acknowledgment on information frame received by this interface LAPB.
IFRAME 147/254 ... DISC 0/0	Statistics information of frames sent and received by this interface LAPB, format: received quantity/sent quantity.
invalid ns	Error statistics of this interface LAPB, including total of received information frames carrying erroneous sequence numbers.
invalid nr	Error statistics of this interface LAPB, including total of received information frames and monitoring frames carrying erroneous acknowledgment numbers.
link resets	Restarting times of this interface LAPB link.
Physical layer is synchronous	Physical layer is synchronous
Baudrate is 64000 bps	Baudrate is 64000 bps on the interface
Interface is DCE, Cable type is V35, Clock mode is DCECLK	Interface is DCE, Cable type is V35, Clock mode is DCECLK
Last clearing of counters: Never	Counters has never been removed
Last 300 seconds input rate	Average input rate in last 300 seconds
Last 300 seconds output rate	Average output rate in last 300 seconds
Input	Input packets
Output	Output packets
DCD	Data carrier detection
DTR	Data terminal ready
DSR	Data set ready
RTS	Request to send
CTS	Clear to send

display x25 alias-policy

Syntax **display x25 alias-policy** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display x25 alias-policy** command to view X.25 alias table.

Related command: **x25 alias-policy**.

Example # Display X.25 alias table.

```
<Sysname> display x25 alias-policy
Alias for interface Serial2/1:
Alias for interface Serial2/0:
    Alias-1:   $20112405$         strict
    Alias-2:   $20112450          left
    Alias-3:   20112450$          right
```

display x25 cug

Syntax **display x25 cug** { **local-cug** [*local-cug-number*] | **network-cug** [*network-cug-number*] }

View Any view

Parameter **local-cug** [*local-cug-number*]: Specifies a local CUG.

network-cug [*network-cug-number*]: Specifies a network side CUG.

Description Use the **display x25 cug** command to display the CUG configuration on the router ports.

Example # Display the CUG configuration on the router ports.

```
<Sysname> display x25 cug local-cug
X.25 Serial2/0, 2 CUGs subscribed with no public access
           local-cug    1 <-> network-cug 4    , no-incoming
           local-cug    2 <-> network-cug 5    , preferentiallocal-cug    3
<-> network-cug 5   , preferential
```

Table 56 Description on the fields of the display x25 cug command

Field	Description
X.25 Serial2/0, 2 CUGs subscribed with no public access	Name of the interface, where two CUG mappings are configured and no incoming/outgoing access policy is configured.
local-cug 2 <-> network-cug 4	Local CUG 2 is mapped to network CUG 4
no-incoming, preferential	Suppression rule: no-incoming indicates income access is prohibited, and preferential indicates the mapping is a preference rule.

display x25 hunt-group-info

Syntax **display x25 hunt-group-info** [*hunt-group-name*]

View Any view

Parameter *hunt-group-name*: Hunt group name, a string of 1 to 30 characters.

Description Use the **display x25 hunt-group-info** command to view the status information of X.25 hunt group.

You can use this command to learn the hunt group of the Router and the information about the interfaces and XOT channel inside the hunt group.

Related command: **x25 hunt-group**.

Example # Display the status information of X.25 hunt group hg1.

```
<Sysname> display x25 hunt-group-info hg1
HG_ID : hg1    HG_Type: round-robin
member      state       vc-used   in-pkts   out-pkts
Serial1/0   Last used   2         51        20
Serial2/0   Next        1         21        15
1.1.1.1     Normal      1         24        3
```

Table 57 Description on the fields of the display x25 hunt-group-info command

Field	Description
HG_ID : hg1	The hunt group name is hg1
HG_Type: round-robin	Hunt group call channel selection policy (including round-robin and vc-number)
member	Interfaces or XOT channel contained in hunt group
state	The state of the current interface or XOT channel, including:
	Last used: latest used
	Next: next selected
	Normal: normal state
	Unavail: Unavailable state
vc-used	Number of calls on the interface or XOT channel (including call success and call failure)
in-pkts	Input flow on the interface or XOT channel in packets
out-pkts	Output flow on the interface or XOT channel in packets

display x25 map

Syntax **display x25 map**

View Any view

Parameter None

Description Use the **display x25 map** command to display the X.25 address mapping table.

The X.25 address mapping can be configured in two methods: using the **x25 map** command or using the **x25 pvc** command. The **display x25 map** command can display all the address mappings.

Example # Display the X.25 address mapping table.

```
<Sysname> display x25 map
Interface:Serial3/0(protocol status is up):
ip address:202.38.162.2   X.121 address: 22
    map-type: SVC_MAP  VC-number: 0
    Facility:
      ACCEPT_REVERSE;
      BROADCAST;
      PACKET_SIZE: I 512  O 512
```

Table 58 Description on the fields of the display x25 map command

Field	Description
Interface:Serial3/0(protocol status is up)	Interface name and protocol status
ip address:202.38.162.2 X.121 address: 22	IP address and X.121 address of the interface
map-type: SVC_MAP	Mapping type
VC-number: 0	VC number
Facility:	User facility of the interface

display x25 pad

Syntax **display x25 pad** [*pad-id*]

View Any view

Parameter *pad-id*: X.25 PAD connection (packet assembly/disassembly facility). The ID is in the range 0 to 255.

Description Use the **display x25 pad** command to display X.25 PAD connection information.

If no pad ID is specified, all PAD connection information will be displayed.

Example # Display all X.25 PAD connection information.

```
<Sysname> display x25 pad
  UI-INDEX130:
  From remote 22 connected to local 11, State: Normal
  X.3Parameters(In):
 1:1,2:0,3:2,4:1,5:0,6:0,7:21,8:0,9:0,10:0,11:14
12:0,13:0,14:0,15:0,16:127,17:21,18:18,19:0,20:0,21:0,22:0
  X.3Parameters(Out):
1:1,2:0,3:2,4:1,5:0,6:0,7:21,8:0,9:0,10:0,11:14
12:0,13:0,14:0,15:0,16:127,17:21,18:18,19:0,20:0,21:0,22:0
Input:
Pkts(total/control): 13/2  bytes:12
queue(size/max) :0/200
Output:
Pkts(total/control): 15/2  bytes:320
```

Table 59 Description on the fields of the display x25 pad command

Field	Description
UI-INDEX130:	User interface index
From remote 22 connected to local 11, State: Normal	Connection of local X.121 address to remote X.121 address and the current connection state of the PAD.
	Connection states:
	Normal: Connection is normal
	Closing: Connection is being closed
	Exception: Connection is abnormal
X.3Parameters(In):	Incoming X.3 parameter
X.3Parameters(Out):	Outgoing X.3 parameter
Input: Pkts(total/control): 13/2	Total number of packets received/total number of control packets received
bytes:12	Total size of packets received
queue(size/max) :0/200	Size/maximum size of receiving queue packets
Output:	Total number of packets sent/total number of control packets sent
Pkts(total/control): 15/2 bytes:320	Size of packets sent

display x25 switch-table pvc

Syntax **display x25 switch-table pvc**

View Any view

Parameter None

Description Use the **display x25 switch-table pvc** command to display X.25 PVC switching table.

Example # Display X.25 PVC switching table.

```
<Sysname> display x25 switch-table pvc
#1  (In: Serial1/1-vc1024)<- ->(Out: Serial1/0-vc1)
#2  (In: Serial1/0-vc1024)<- ->(Out: Serial1/1-vc1)
```

Table 60 Description on the fields of the display x25 switch-table pvc command

Field	Description
(In: Serial1/1-vc1024)<- ->(Out: Serial1/0-vc1)	Data is exchanged between PVC 1024 of Serial 1/1 and PVC 1 of Serial 1/0.

display x25 switch-table svc

Syntax **display x25 switch-table svc** { **dynamic** | **static** }

View Any view

Parameter **dynamic**: Displays VC switching table.

static: Displays SVC switching table.

Description Use the **display x25 switch-table svc** command to display SVC switching table.

With the keyword **static** included, the manually configured SVC switching table is displayed.

With the keyword **dynamic** included, the VC switching table is displayed. VC routing table is the link relationship between the node port number and the logic channel number of the VC. VC routing table changes with calls: it is generated as a call is established and it is cleared as the call is over.

Related command: **x25 switch svc**.

Example # Display X.25 SVC static switching table.

```
<Sysname> display x25 switch-table svc static
Number Destination  Substitute-src Substitute-dst CUD   SwitchTo(type/name)
1      11                                           I/Serial2/0
2      22                                           I/Serial2/1/0
3      131                                          H/hg1
4      132                                          T/123.123.123.123
5      133                                          T/123.123.123.123
6      111          222            333              T/4.4.4.4
Total of static svc is 6.
The item type of SwitchTo meaning:
I: interface   H: hunt-group   T: xot
```

Table 61 Description on the fields of the display x25 switch-table svc command

Field	Description
Number	Route sequence number in the switching table
Destination	Destination X.121 address
Substitute-src	X.121 source address after substitution; if the content is blank, it means no substitution.
Substitute-dst	X.121 destination address after substitution; if the content is blank, it means no substitution.
CUD	Call User Data
SwitchTo	Forwarding address of this route, which can be an interface, XOT channel or hunt group

display x25 vc

Syntax **display x25 vc** [*lci*]

View Any view

Parameter *lci*: Logical channel identifier in the range 1 to 4095. If not specified, all VCs will be displayed.

Description Use the **display x25 vc** command to display X.25 virtual circuit information.

Note that if no logical channel identifier is specified, the information about all virtual circuits is displayed.

There are three types of virtual circuits as follows:

- An SVC (switched virtual circuit) is set up temporarily by X.25 through calling as required.
- A PVC is configured manually and exists regardless of the data transmission requirement.
- When the device works in X.25 switching mode, virtual circuits will be set up in order to transfer data.

Information about the three types of virtual circuits can be shown with this command, and only some fields of their outputs differ.

Example # Display X.25 VC information.

```
<Sysname> display x25 vc
Interface: Serial2/0
  SVC 1
    State: P4(transmit)
    Map: ip 10.1.1.2 to 130
    Window size: input 2  output 2
    Packet Size: input 128  output 128
    Local PS: 5  Local PR: 5  Remote PS: 5  Remote PR: 4

      Bytes 53/363
    Send Queue(Current/Max): 0/200
```

Table 62 Description on the fields of the display x25 vc command

Field	Description
Interface: Serial2/0	Interface name
SVC 1	SVC number
State: P4(transmit)	SVC state: P4 (transmission state)
Map: ip 10.1.1.2 to 130	Address mapping
XOT PVC <--> Serial2/0 PVC 1 connected	PVC from XOT to serial2/0 already established
PVC <--> XOT Serial2/0-1.1.1.1 PVC 1 connected	PVC from serial2/0 to XOT already established
PAD: UI-130 From remote 130 connected to local 220	PAD: User interface index 130, connection from remote X.121 address 130 to local X.121 address 220
Window size: input 2 output 2	VC window size: input 2 output 2
Packet Size: input 128 output 128	Packet Size: input 128 output 128
Local PS: 5 Local PR: 5 Remote PS: 5 Remote PR: 4	Local packet sending sequence number, local packet receiving sequence number, remote packet sending sequence number, remote packet receiving sequence number
Local Busy: FALSE Reset times: 0	Local busy/reset times
Input/Output: DATA 5/5 INTERRUPT 0/0 RR 6/2 RNR 0/0 REJ 0/0 Bytes 420/420	Input/Output : Data 5/5 Break 0/0 Ready to receive 6/2 Not ready to receive 0/0 Reject 0/0 Total bytes of the upper layer 420/420
Send Queue(Current/Max): 0/200	Length of sending queue (current/maximum)

display x25 x2t switch-table

Syntax **display x25 x2t switch-table**

View Any view

Parameter None

Description Use the **display x25 x2t switch-table** command to display the X2T (X.25 to TCP) switching table.

The entry exists when the router sets up an XOT connection and is deleted after the connection is closed.

Example # Display the X2T switching table on the router.

```
<Sysname> display x25 x2t switch-table
    X.121       Interface    [LCD       ] <--> Ip Address  port   SocketId
    ========================================================================
    222         Serial1/0    [SVC:1024  ] <--> 20.1.1.1    102    2
    NULL        Serial1/0    [PVC:1     ] <--> 20.1.1.1    104    2
```

Table 63 Description on the fields of the display x25 x2t switch-table command

Field	Description
X.121	X.121 address
Interface	Interface name
LCD	SVC or PVC connection
Ip Address	IP address
Port	TCP port number
SocketId	Socket ID

display x25 xot

Syntax **display x25 xot**

View Any view

Parameter None

Description Use the **display x25 xot** command to display XOT (X.25 over TCP) connection information, such as peer IP and port, local IP and port, keepalive setting of socket and incoming/outgoing interface names.

Related command: **x25 switch svc xot**, **x25 xot pvc**.

Example # Display XOT connection information.

```
<Sysname> display x25 xot
SVC 1024:  ( ESTAB )
```

```
tcp peer ip: 10.1.1.1, peer port: 1998
tcp local ip: 10.1.1.2, local port: 1024
socket keepalive period: 5, keepalive tries: 3
come interface name: Serial1/0-10.1.1.1-1024
go interface name: Serial1/0
```

lapb max-frame

Syntax **lapb max-frame** *n1-value*

undo lapb max-frame

View Interface view

Parameter *n1-value*: N1 value of the LAPB parameter in bits, in the range 1096 to 12104. It is the maximum value of a frame expected from the DTE or DCE, 8 times the value of MTU plus the protocol header.

Description Use the **lapb max-frame** command to configure the LAPB N1 parameter.

Use the **undo lapb max-frame** command to restore the default.

The default value of N1 is calculated according to the MTU, upper layer protocol and modulo, as shows below:

Table 64 Difference between N1 and MTU (in bytes) versus upper layer protocol and modulo

Upper layer protocol	Modulo	Difference between N1 and MTU (bytes)
IP/IPX	8	4
IP/IPX	128	5
Multiprotocol	8	6
Multiprotocol	128	7
X.25	8	7
X.25	128	8

The default value of N1 varies with MTU and modulo.

For example, upon system initialization, the upper layer protocol is IP, modulo 8 and MTU 1500, so the default value of N1 is (1500+4)*8 = 12032. If the modulo is set to 128, then the default value of N1 is (1500+5)*8 = 12040. You can use the **undo lapb max-frame** command to restore the new default. For the same reason, N1 changes with the change of MTU.

Example # Set the LAPB N1 parameter to 1160 on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] lapb max-frame 1160
```

lapb modulo

Syntax **lapb modulo** { **8** | **128** }

undo lapb modulo

View Interface view

Parameter **8**: Modulo 8.

128: Modulo 128.

Description Use the **lapb modulo** command to specify the LAPB modulo.

Use the **undo lapb modulo** command to restore the default.

The default is modulo 8.

There are two LAPB frame numbering modes: modulo 8 and modulo 128. Each frame (I frame) is numbered in sequence, in the range 0 to the modulo minus 1. Sequence numbers will cycle within the range.

Modulo 8 is the basic mode. It is sufficient for most links.

Related command: **lapb window-size**.

Example # Set the LAPB frame numbering mode on Serial2/0 to modulo 8.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] lapb modulo 8
```

lapb retry

Syntax **lapb retry** *n2-value*

undo lapb retry

View Interface view

Parameter *n2-value*: Value of LAPB N2, indicating the maximum retries that a DCE or DTE sends one frame to DTE or DCE. The value ranges from 1 to 255.

Description Use the **lapb retry** command to configure LAPB parameter N2.

Use the **undo lapb retry** command to restore the default.

The default is 10.

Example # Set the LAPB parameter N2 on Serial 2/0 to 20.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] lapb retry 20
```

lapb timer

Syntax **lapb timer** { **t1** *t1-value* | **t2** *t1-value* | **t3** *t3-value* }

undo lapb timer { **t1** | **t2** | **t3** }

View Interface view

Parameter **t1** *t1-value*: Value of timer T1, in the range 2 to 64000 milliseconds. The default is 3000 milliseconds.

t2 *t2-value*: Value of the timer T2, in the range 1 to 32000 milliseconds. The default is 1500 milliseconds.

t3 *t3-value*: Value of the timer T3, in the range 0 to 255 seconds. The default is 0 seconds.

Description Use the **lapb timer** command to configure the LAPB timers T1, T2 and T3.

Use the **undo lapb timer** command to restore their default values.

T1 is the retransmission timer. When T1 expires, DTE (DCE) will start retransmission. The value of T1 shall be greater than the maximum time between the sending of a frame and the receiving of its response frame.

T2 is the reception timer. When it expires, the DTE/DCE must send an acknowledgement frame so that this frame can be received before the peer DTE/DCE T1 timer expires (T1Š2*T2).

T3 is an idle channel timer, when it expires, the DCE reports to the packet layer that the channel stays idle for a long time. T3 should be greater than the timer T1 (T3>T1) on a DCE. When T3 is 0, it indicates that it does not function yet.

Example # Set the LAPB timer T1 on Serial2/0 to 2000 milliseconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] lapb timer t1 2000
```

lapb window-size

Syntax **lapb window-size** *k-value*

undo lapb window-size

View Interface view

Parameter *k-value*: Maximum number of sequence numbered frames to be acknowledged by DTE or DCE during any specified time. If the modulo is 8, the value of the window parameter K ranges 1 to 7. If the modulo is 128, the value of the window parameter K ranges 1 to 127.

Description Use the **lapb window-size** command to configure the LAPB window parameter K.

Use the **undo lapb window-size** command to restore the default.

The default is 7.

Related command: **lapb modulo**.

Example # Set the LAPB window parameter K on the interface Serial 2/0 to 5.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] lapb window-size 5
```

link-protocol lapb

Syntax **link-protocol lapb** [**dce** | **dte**] [**ip** | **multi-protocol**]

View Interface view

Parameter **dce**: Specifies DCE mode of LAPB.

dte: Specifies DTE mode of LAPB.

ip: Specifies the upper layer protocol as IP.

multi-protocol: Specifies the upper layer protocol as multi-protocol.

Description Use the **link-protocol lapb** command to specify the link layer protocol of the interface as LAPB.

By default, the link layer protocol of an interface is PPP.

When the link layer protocol is LAPB, the default operating mode is DTE, and the upper layer protocol is IP.

Though LAPB is a layer-2 protocol of X.25, it can act as an independent link-layer protocol for simple data transmission. Generally, LAPB can be used when two routers are directly connected with a dedicated line. At that time one end works in the DTE mode, and the other in the DCE mode.

Example # Configure the link layer protocol and operating mode of Serial 2/0 as LAPB and DCE.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol lapb dce
```

link-protocol x25

Syntax **link-protocol x25** [**dce** |**dte**] [**ietf** | **nonstandard**]

View Interface view

Parameter **dce**: Specifies the DCE mode.

dte: Specifies the DTE mode.

Ietf: Encapsulates IP or other network protocols on the X.25 network based on the standard stipulation of the IETF RFC 1356.

nonstandard: Nonstandard encapsulates IP or other network protocols on the X.25 network.

Description Use the **link-protocol x25** command to encapsulate X.25 protocol on the specified interface.

By default, the link-layer protocol for the interface is PPP. When the interface uses X.25 protocol, it works in DTE IETF mode by default.

Note that:

When two Routers are connected via the X.25 public packet network, they shall work as DTE and use IETF format.

If two Routers are directly connected, one Router shall work as DTE, the other as DCE. Both parties should use the same data format.

If the X.25 switching function is used, the device should work as DCE.

In practice, select the IETF format if there is no special requirement.

Example # Specify X.25 as the link layer protocol of the interface Serial2/0 that works in DTE IETF mode.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol x25 dte ietf
```

pad

Syntax **pad** *x121-address*

View User view

Parameter *x121-address*: Destination X.121 address, a string of 1 to 15 numerical characters.

Description Use the **pad** command to establish a X.25 PAD connection and logon to the remote site.

PAD is similar to telnet. It can establish the connection from the local to the remote through the remote X121 address to carry out configuration operations.

Example # Establish a PAD connection to the destination X.121 address 2.

```
<Sysname> pad 2
```

reset xot

Syntax **reset xot local** *local-ip-address local-port* **remote** *remote-ip-address remote-port*

View User view

Parameter *local-ip-address*: Local IP address of the XOT connection.

local-port: Local port number of the XOT connection.

remote-ip-address: Remote IP address of the XOT connection.

remote-port: Remote port number of the XOT connection.

Description For SVC, use the **reset xot** command to clear an XOT link.

For PVC, use the **reset xot** command to reset an XOT link.

When you clear or reset the XOT link, you can obtain the required ports using the **display x25 xot** or **display tcp status** command.

Example # Clear or reset the XOT link.

```
<Sysname> reset xot local 10.1.1.1 1998 remote 10.1.1.2 1024
```

reset x25

Syntax **reset x25** { **counters interface** *interface-type interface-number* | **vc interface** *interface-type interface-number* [*vc-number*] }

View User view

Parameter **counters**: Resets interface statistics.

vc: Resets X.25 virtual circuit.

interface-type interface-number: Specifies an interface by its type and number.

vc-number: Virtual circuit number of PVC or SVC, in the range 1 to 4095.

Description Use the **reset x25** command to reset X.25 protocol statistics or X.25 virtual circuit on the specified interface.

For PVC number, the command resets the PVC.

For SVC number, the command deletes the SVC.

Example # Reset the X.25 statistics on Serial 2/0.

```
<Sysname> reset x25 counters interface serial 2/0
```

reset lapb statistics

Syntax **reset lapb statistics**

View Interface view

Parameter None

Description Use the **reset lapb statistics** command to clear LAPB statistics.

Example # Clear the LAPB statistics on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] reset lapb statistics
```

translate ip

Syntax **translate ip** *ip-address* **port** *port-number* { **pvc** *interface-type interface-number pvc-number* | **x25** *x.121-address* }

undo translate ip *ip-address* **port** *port-number*

View System view

Parameter *ip-address*: Local IP address.

port *port-number*: TCP port number on which the local router listen messages, in the range 1 to 65535.

Interface-type interface-number: Specifies an interface by its type and number.

pvc-number: PVC number, in the range 1 to 4095.

x.121-address: X.121 address.

Description Use the **translate ip** command to configure an X2T forwarding route from IP network to X.25 network.

Use the **undo translate ip** command to remove the route.

When a host in the IP network sends packets to the specified IP address and port number of the device, the device will translate these IP packets to X.25 ones and then forward them to the specified X.121 address or PVC in the X.25 network.

CAUTION:

- *The maximum number of IP-to-X.25 mappings varies by device.*
- *For the **translate ip** command, if an IP address uses only one port number, port number 102 is preferred whenever possible. If an IP address uses multiple port numbers, port numbers between 1024 and 5000 are recommended and the well-known port numbers (such as 21, 23) are not used to avoid network failure.*

Example # Configure an X2T forwarding route to forward the packets that the local device receives at 10.1.1.1:102 to the X.121 address 111.

```
<Sysname> system-view
[Sysname] translate ip 10.1.1.1 port 102 x25 111
```

Configure an X2T forwarding route to forward the packets that the local device receives at 10.1.1.1:102 to PVC 1 on the interface Serial2/0.

```
<Sysname> system-view
[Sysname] translate ip 10.1.1.1 port 102 pvc serial 2/0 1
```

translate x25

Syntax **translate x25** *x.121-address* **ip** *ip-address* **port** *port-number*

undo translate x25 *x.121-address*

View System view

Parameter *x.121-address:* X.121 address.

ip *ip-address:* IP address of the remote host.

port *port-number*: Port number of the remote host.

Description Use the **translate x25** command to configure an X2T forwarding route from X.25 network to IP network.

Use the **undo translate x25** command to cancel this configuration.

You can implement the packet forwarding from an X.25 network to an IP network using this command. The device compares the destination address in the X.25 call request packet to the *x.121-address*, if they match, then initiates a TCP connection

to the specified IP address and port number. Packets received from the X.25 model are added with an X2T header to forward through the TCP connection.

You can establish mappings between port numbers and X.121 addresses by multiple commands.

CAUTION: *The maximum number of IP-to-X.25 mappings varies by device.*

Example # Configure an X2T forwarding route to forward the packets that are received at the X.121 address 111 to the IP address 10.1.1.1:102.

```
<Sysname> system-view
[Sysname] translate x25 1111 ip 10.1.1.1 port 102
```

x25 alias-policy

Syntax **x25 alias-policy** *match-type alias-string*

undo x25 alias-policy *match-type alias-string*

View Interface view

Parameter *match-type*: Match type of the alias. There are 9 optional match types:

- **free**: Free match
- **free-ext**: Extended free match
- **left**: Left alignment match
- **left-ext**: Extended left alignment match
- **right**: Right alignment match
- **right-ext**: Extended right alignment match
- **strict**: Strict match
- **whole**: Whole match
- **whole-ext**: Extended whole match

alias-string: Alias name, a string of 1 to 17 characters.

Description Use the **x25 alias-policy** command to configure the alias of an X.121 address.

Use the **undo x25 alias-policy** command to delete the alias of an X.121 address.

By default, no x.25 alias is configured.

When an X.25 call is forwarded between networks, different X.25 networks may perform some operations on the destination addresses (that is, the called DTE address) carried by this call packet, for example, regularly adding or deleting the prefix and suffix. In this case, you need to set an interface alias for the router to

adapt this change. Please consult your ISP to learn if the network supports this function before deciding on whether the alias function is enabled or not.

For information about x.25 alias, refer to "x25 alias-policy" on page 441.

Example # Configure the link-layer protocol on interface Serial2/0 as X.25 and its X.121 address to 20112451, and set two aliases with different match types for it.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol x25
[Sysname-Serial2/0] x25 x121-address 20112451
[Sysname-Serial2/0] x25 alias-policy right 20112451$
[Sysname-Serial2/0] x25 alias-policy left $20112451
```

With the above configurations, a call whose destination address is 20112451 can be accepted as long as it can reach the local X.25 interface Serial2/0, no matter whether the network is performing the prefix adding operation or suffix adding operation.

x25 call-facility

Syntax **x25 call-facility** *facility-option*

undo x25 call-facility *facility-option*

View Interface view

Parameter *facility-option*: User facility option, including:

Table 65 Description on the user facility option

Option	Description
closed-user-group *group number*	Specifies a closed user group (CUG) number for the X.25 interface. The facility enables DTE to belong to one or more CUGs. CUG allows the DTEs in it to communicate with each other, but not to communicate with other DTEs. The group number is in the range 0 to 9999.
packet-size *input-size output-size*	Carries out maximum packet size negotiation in initiating call from the X.25 interface. Maximum packet size negotiation is part of flow control parameter negotiation. It needs two parameters: maximum input packet size and maximum output packet size, which must range from 16 (inclusive) to 4096 (inclusive), and must be the integer power of 2.
reverse-charge-request	Carries reverse charging request when initiating calls from the X.25 interface.
roa-list *roa name*	Specifies an ROA list name for the X.25 interface. The *roa name* is a string of 1 to 19 characters.
send-delay *delay-time*	Carries out the maximum network send delay negotiation when initiating calls from the X.25 interface. The delay time is in the range 0 to 65534 ms.
threshold *input-value output-value*	Specifies throughput negotiation values for initiating calls from the X.25 interface. The values of *input/output* can only be 75, 150, 300, 600, 1200, 2400, 4800, 9600, 19200, and 48000.

Table 65 Description on the user facility option

Option	Description
window-size *input-window-size output-window-size*	Carries out the window size negotiation when initiating calls from the X.25 interface. Window size negotiation is a part of flow control parameter negotiation. It needs two parameters: input window size and output window size. When the modulo is 8, the size is in the range 1 to 7; when the modulo is 128, it is in the range 1 to 127.

Description Use the **x25 call-facility** command to set user options for an X.25 interface. After an option is set, all X.25 calls from the X.25 interface will carry the relevant information field in call packet.

Use the **undo x25 call-facility** command to delete the set option.

By default, no facility is set.

The user facilities set via this command are available for all the calls originating from this X.25 interface. You can also use the optional parameter *option* of the **x25 map** command to set user facility option for the X.25 call originating from a specific address map. What's more, the priority of user facility configured with the **x25 map** command is higher than that configured with the **x25 call-facility** command.

Related command: **x25 map**, **x25 modulo**.

Example # Specify the flow control parameter negotiation with the peer end for the calls from the X.25 interface serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 call-facility packet-size 512 512
[Sysname-Serial2/0] x25 call-facility window-size 5 5
```

x25 cug-service

Syntax **x25 cug-service** [**incoming-access** | **outgoing-access** | **suppress** { **all** | **preferential** }] *

undo x25 cug-service

View Interface view

Parameter **incoming-access**: Incoming access policy.

outgoing-access: Outgoing access policy.

suppress all: Suppresses all. If the incoming packet contains CUG facility, delete the CUG facility and process the call. It does not apply to outgoing call.

suppress preferential: Processes only the calls configured with preference rule.

Description Use the **x25 cug-service** command to enable CUG service and suppression policies.

Use the **undo x25 cug-service** command to disable CUG service.

By default, CUG service is disabled.

After CUG service is enabled, the system suppresses those calls matching the preset conditions. The details are:

- If no parameter is configured, allow incoming/outgoing calls without CUG facilities, and allow incoming/outgoing calls with CUG facilities after deleting the CUG facilities.
- If the **incoming-access** parameter is chosen, the system suppresses incoming calls. That is, it suppresses the incoming calls that has CUG facilities but has no CUG mapping rules allowing them to pass, and lets the incoming calls without CUG facilities pass through.
- If the **outgoing-access** parameter is chosen, the system suppresses outgoing calls. That is, it suppresses the outgoing calls that has CUG facilities but has no CUG mapping rules allowing them to pass, and lets the outgoing calls without CUG facilities pass through.
- If the **suppress all** parameter is chosen, the system removes CUG facilities for the incoming calls with CUG facilities and makes call processing. This parameter is ineffective to outgoing calls.
- When the **suppress preferential** parameter is included, if an incoming call with CUG facilities and the suppression rule is **preferential**, the system then removes its CUG facilities and make call processing. If the suppression rule is not **preferential**, the system does not remove its CUG facilities but lets it pass through. This parameter is ineffective to outgoing calls.

Related command: **x25 local-cug**.

*The command is used at DCE end. You can use the **link-protocol x25** dce command to set the interface to work in DCE mode.*

Example # Enable CUG service with incoming access policy on the interface Serial2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 cug-service incoming-access
```

x25 default-protocol

Syntax **x25 default-protocol** *protocol-type*

undo x25 default-protocol

View Interface view

Parameter *protocol-type*: Protocol type. IP is available at present.

Description Use the **x25 default-protocol** command to set the default upper-layer protocol of X.25 for the X.25 interface.

Use the **undo x25 default-protocol** command to restore the default.

By default, no upper-layer protocol is specified.

During X.25 SVC setup, the called device will check the call user data field of X.25 call request packet. If it is an unidentifiable one, the called device will deny the setup of the call connection. However, a user can specify a default upper-layer protocol carried over X.25. When X.25 receives a call with unknown CUD, the call can be treated based on the default upper-layer protocol specified by a user.

Example # Set the default upper-layer protocol over the X.25 interface Serial2/0 to IP.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 default-protocol ip
```

x25 hunt-group

Syntax **x25 hunt-group** *hunt-group-name* { **round-robin** | **vc-number** }

undo x25 hunt-group *hunt-group-name*

View System view

Parameter *hunt-group-name*: Name of a hunt group, a string of 1 to 30 characters.

round-robin: Selects call channel using cyclic selection policy.

vc-number: Selects call channel using the policy of computing available logical channel.

Description Use the **x25 hunt-group** command to create or enter an X.25 hunt group.

Use the **undo x25 hunt-group** command to delete the specified X.25 hunt group.

X.25 hunt group supports two call channel selection policies: **round-robin** mode and **vc-number** mode, and a hunt group only uses one channel selection policy. The **round-robin** mode will select next interface or XOT channel inside hunt group for each call request using cyclic selection method. The **vc-number** mode will select the interface with the most idle-logical channels in hunt group for each call request.

A hunt group can have 10 interfaces or XOT channels at most, and it can select the available channels between interface and XOT channel.

XOT channel cannot join the hunt group that adopts the **vc-number** selection policy.

Example # Create hunt group hg1 which uses cyclic selection policy.

```
<Sysname> system-view
[Sysname] x25 hunt-group hg1 round-robin
[Sysname-hg-hg1]
```

x25 ignore called-address

Syntax **x25 ignore called-address**

undo x25 ignore called-address

View Interface view

Parameter None

Description Use the **x25 ignore called-address** command to enable it to ignore the X.121 address of the called DTE when X.25 initiates calls.

Use the **undo x25 ignore called-address** command to disable this function.

By default, this function is disabled.

According to X.25, the calling request packet must carry the address. However, on some occasions, the X.25 calling request does not have to carry the called/calling DTE address in a specific network environment or as is required by the application. This command enables users to specify whether the call request packet sent by X.25 in the device carries the called DTE address.

Related command: **x25 response called-address**, **x25 response calling-address**, **x25 ignore calling-address**.

Example # Specify the call request packet from the X.25 interface Serial 2/0 not to carry the called DTE address.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 ignore called-address
```

x25 ignore calling-address

Syntax **x25 ignore calling-address**

undo x25 ignore calling-address

View Interface view

Parameter None

Description Use the **x25 ignore calling-address** command to enable it to ignore the X.121 address of the calling DTE when X.25 initiates calls.

Use the **undo x25 ignore calling-address** command to disable this function.

By default, this function is disabled.

According to X.25, the calling request packet must carry the address. However, on some occasions, the X.25 calling request does not have to carry the called/calling DTE address in a specific network environment or as is required by the application. This command enables users to specify whether the call request packet sent by X.25 in the device carries the calling DTE address.

Related command: **x25 response called-address**, **x25 response calling-address**, **x25 ignore called-address**.

Example # Specify the call request packet from the X.25 interface Serial 2/0 not to carry the calling DTE address.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 ignore calling-address
```

x25 local-cug

Syntax **x25 local-cug** *local-cug-number* **network-cug** *network-cug-number* [**no-incoming** | **no-outgoing** | **preferential**]*

undo x25 local-cug *cug-number*

View Interface view

Parameter *local-cug-number*: Number of local cug.

network-cug-number: Number of network cug.

no-incoming: Suppresses incoming calls.

no-outgoing: Suppresses outgoing calls.

preferential: Specifies the preference rule.

Description Use the **x25 local-cug** command to configure mapping from local CUG to network CUG and define its suppression rule.

Use the **undo x25 local-cug** command to remove the mapping from local CUG to network CUG.

The command is disabled by default.

CUG map is the exchange relationship between local (DTE device) and network (X.25 network) CUG numbers when the device is processing CUG calls. For

example, if the DTE with CUG number as 10 wants to call the DTE with CUG number as 20 in the network, the device will first find the map in the map table. If the map is found, change the CUG number of the calling packet to 20 and forward the packet; if not found, refuse to forward the packet.

You can specify the suppress rule while configuring CUG map. There are three suppress rules:

1. Suppress income access **no-incoming**
2. Suppress outgoing access **no-outgoing**
3. Specify the preference rule **preferential**

Among them, preference rule is specified as related with suppress CUG policy, that is, if suppress policy is set to suppress CUG in the preferential mapping call (the **suppress preferential** parameter), then delete the CUG facility in the incoming packets of the map and process the calls.

Related command: **x25 call-facility**, **x25 cug-service**.

*If the command is used at DCE side, use the **link-protocol x25** dce command to set the interface as DCE.*

Example # Define the rule on the serial interface Serial2/0: the incoming calls with 100 local CUGs or 200 network CUGs are denied.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 cug-service
[Sysname-Serial2/0] x25 local-cug 100 network-cug 200 no-incoming
```

x25 map

Syntax **x25 map** *protocol-type protocol-address* **x121-address** *x.121-address* [*option*]

undo x25 map { **ip** | **compressedtcp** } *protocol-address*

View Interface view

Parameter *protocol-type*: Protocol type, with **ip** (IP protocol) and/or **compressedtcp** (IP protocol supporting TCP header compression). If you want to configure both of them, ensure that the *protocol-address* are same for both **ip** and **compressedtcp**. The **compressedtcp** requires correct configuration for all the link ends, otherwise, the link may be blocked.

protocol-address: Network protocol address of the peer host.

x121-address *x.121-address*: X.121 address of the peer host.

option: Specifies some attributes or user facilities for the address mapping.

The following gives the detailed information of options:

Table 66 Description on the attributes or user facilities of X.25 address mapping

Option	Description
broadcast	Sends broadcasts of network protocol and multicasts of IP to the destination. This option provides support for some routing protocols (such as Routing Information Protocol).
closed-user-group *group number*	Specifies a closed user group (CUG) number for the X.25 interface, in the range 0 to 9999.
compress	Compresses X.25 payloads.
encapsulation-type	Encapsulation type, with **nonstandard**, **ietf**, **multi-protocol** and **snap** available.
idle-timer *minutes*	Maximum idle time for the VC associated with the address mapping. 0 means that the idle time is infinite.
no-callin	Disables accepting calls to the address mapping.
no-callout	Disables calls originating from the address mapping.
packet-size *input-size output-size*	Carries out maximum packet size negotiation when initiating calls from the mapping. It needs two parameters: maximum input packet size and maximum output packet size, which must range from 16 to 4096 bytes, and must be the integer power of 2.
reverse-charge-accept	If a call initiated by the address mapping carries reverse charging request, to accept the call, this option must be configured in the address mapping.
reverse-charge-request	Specifies calls from the address mapping to carry reverse charging requests
roa-list *roa-name*	Specifies an ROA list name for the X.25 interface. The *roa name* is a string of 1 to 19 characters.
send-delay *delay-time*	Carries out the maximum network transmission delay negotiation when initiating calls from the mapping. The delay time is in the range 0 to 65534 ms.
threshold *input-value output-value*	Specifies threshold values when initiating throughput negotiation with the peer from the mapping. The values of *input/output* can only be 75, 150, 300, 600, 1200, 2400, 4800, 9600, 19200, or 48000.
vc-per-map *count*	Maximum number of VCs associated with the address mapping, in the range 1 to 8.
window-size *input-window-size output-window-size*	Carries out the window size negotiation with the peer when initiating calls from the address mapping, including input window size and output window size. When the modulo is 8, the size is in the range 1 to 7; when the modulo is 128, it is in the range 1 to 127.

Description

Use the **x25 map** command to set the address mapping between IP address and X.121 address.

Use the **undo x25 map** command to delete a mapping.

By default, no address mapping is configured.

Since X.25 protocol can multiplex multiple logical virtual circuits on a physical interface, you need to manually specify the mapping relation between all network addresses and X.121 addresses.

Once you have specified an address mapping, its contents (including protocol address, X.121 address and all options) cannot be changed. To make

modifications, you can first delete this address mapping via the **undo x25 map** command, and then establish one new address mapping.

Two or more address mappings with an identical protocol address shall not exist on the same X.25 interface.

Related command: **display x25 map**, **x25 reverse-charge-accept**, **x25 call-facility**, **x25 timer idle**, **x25 vc-per-map**.

Example # Set two address mappings on the X.25 interfaces Serial2/1 and Serial2/0, respectively, and the four address mappings have different attributes.

```
<Sysname> system-view
[Sysname] interface serial 2/1
[Sysname-Serial2/1] x25 map ip 202.38.160.11 x121-address 20112451 reverse-c
harge-request reverse-charge-accept
[Sysname-Serial2/1] x25 map ip 202.38.160.138 x121-address 20112450 packet-s
ize 512 512 idle-timer 10
[Sysname-Serial1/0] quit
[Sysname] interface serial2/0
[Sysname-Serial2/0] x25 map ip 20.30.4.1 x121-address 25112451 window-size 4
 4 broadcast
[Sysname-Serial2/0] x25 map ip 20.30.4.8 x121-address 25112450 no-callin
```

x25 modulo

Syntax **x25 modulo** { **8** | **128** }

undo x25 modulo

View Interface view

Parameter **8**: Uses modulo 8 mode.

128: Uses modulo 128 mode.

Description Use the **x25 modulo** command to set the modulo mode of the X.25 interface.

Use the **undo x25 modulo** command to restore the default.

The default is modulo 8 mode.

The slip window is the basis for X.25 traffic control, and the key about the slip window is that the sent packets are numbered cyclically in order and are to be acknowledged by the peer end. The order in numbering refers to the ascending order, like "...2, 3, 4, 5, 6..." "Cyclically" means that the numbering starts again from the beginning when a certain number (called modulo) is reached. For example, when the modulo is 8, the numbering goes "...4, 5, 6, 7, 0, 1..."

X.25 defines two numbering modulo: 8 (also called the basic numbering) and 128 (also called extended numbering).

- *The packet numbering mode on the pair of DTE and DCE must be the same*
- *You need to run the **shutdown** and **undo shutdown** commands on the interface to apply the new configuration.*
- *The packet numbering mode of X.25 Layer 3 is different from the frame numbering mode of LAPB (Layer 2 in X.25). When modulo 128 is applied to the DTE/DCE interface with high throughput, it improves only the efficiency of local DTE/DCE interface (point-to-point efficiency) for LAPB; while for Layer 3 in X.25, it improves the efficiency of the two communicating DTE peers (or peer-to-peer efficiency).*

Example # Set the modulo on the X.25 interface Serial 2/0 to 128.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 modulo 128
```

x25 packet-size

Syntax **x25 packet-size** *input-packet output-packet*

undo x25 packet-size

View Interface view

Parameter *input-packet*: Maximum input packet length in bytes, ranging from 16 (inclusive) to 4096 (inclusive) and must be the integer power of 2.

output-packet: Maximum output packet length in bytes, its value ranges from 16 (inclusive) to 4096 (inclusive) and must be the integer power of 2.

Description Use the **x25 packet-size** command to set the maximum input and output packet lengths of X.25 interface.

Use the **undo x25 packet-size** command to restore their default values.

By default, the maximum input packet length is 128 bytes, and the maximum output packet length is 128 bytes.

Normally, an X.25 packet-switching network has a limitation of the transmission packet size, and the maximum size of a data packet sent by the DTE shall not exceed this size (otherwise it will trigger the reset of the VC). In this way, the DTE devices at sending end and receiving end are required to have datagram fragmentation and reassembly functions. The DTE device at sending end fragments the datagram with a length exceeding the maximum transmission packet length based on the maximum transmission packet length, and sets M bit in other fragments except the final fragment. After receiving these fragments, the DTE at receiving end will reassemble them to a datagram and submit it to the upper-layer protocol based on the M bit. Consult access ISP about this maximum receiving packet length.

Normally, the maximum receiving packet length is equivalent to the maximum sending packet. Unless access ISP allows, do not configure these two parameters with different values.

Example # Set the maximum receiving packet length and maximum sending packet length on X.25 interface Serial 2/0 to 256 bytes.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 packet-size 256 256
```

x25 pvc

Syntax **x25 pvc** *pvc-number protocol-type protocol-address* **x121-address** *x.121-address* [*option*]

undo x25 pvc *pvc-number*

View Interface view

Parameter *pvc-number*: PVC number, in the range 1 to 4095 (inclusive), and must be in the PVC channel range.

protocol-type: Upper-layer protocol carried over the permanent virtual circuit, which may be **IP** (indicating that the upper-layer network protocol is IP protocol) or **compressedtcp** (indicating that the upper-layer network protocol is IP protocol, and supports TCP head compressing).

protocol-address: Network protocol address of the peer end of the PVC.

x121-address *x.121-address*: X.121 address of the peer end of this PVC.

option: Attribute option of the PVC. Detailed description of PVC options:

Table 67 Description on PVC attribute option

Option	Description
broadcast	Forwards broadcast packets to the PVC peer.
encapsulation-type	Encapsulation type, which may be **nonstandard**, **ietf**, **multi-protocol** or **snap**.
compress	Compresses X.25 payload.
packet-size *input-packet output-packet*	Specifies the maximum input packet length and maximum output packet length in bytes, which must range from 16 to 4096, and must be the integer power of 2.
window-size *input-window-size output-window-size*	Specifies the input and output window sizes of the PVC. When the modulo is 8, it is in the range 1 to 7; when the modulo is 128, it is in the range 1 to 127.

Description Use the **x25 pvc** command to configure a PVC route.

Use the **undo x25 pvc** command to delete a PVC route.

By default, no PVC is created. When creating such a PVC, if you do not set the relevant attributes for the PVC, its flow control parameters will be the same as that of the X.25 interface (the flow control parameters on an X.25 interface can be set by the **x25 packet-size** and **x25 window-size** commands).

As one corresponding address mapping is created along with the PVC, it is unnecessary (or impossible) to establish an address mapping first before creating PVCs.

Before creating PVCs, you should first enable the PVC channel range. The range is between 1 and the latest unprohibited channel PVC number minus 1 (including 1 and the lowest PVC number minus 1). Naturally, if the lowest PVC number is 1, the PVC section will be disabled. The following table shows some typical PVC ranges.

Table 68 PVC channel ranges for some typical configurations

PVC channel range	Incoming-only channel range	Two-way channel range	Outgoing-only channel range
Disabled	[0, 0]	[1, 1024]	[0, 0]
[1, 9]	[0, 0]	[10, 24]	[0, 0]
Disabled	[1, 10]	[15, 30]	[0, 0]
[1, 4]	[5, 10]	[15, 25]	[30, 32]
[1, 19]	[0, 0]	[0, 0]	[20, 45]
[1, 4094]	[0, 0]	[0, 0]	[4095, 4095]

Example # Configure the link layer protocol on the interface Serial 2/0 as X.25, enable PVC channel range, and set two PVCs.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol x25
[Sysname-Serial2/0] x25 vc-range bi-channel 8 1024
[Sysname-Serial2/0] x25 pvc 2 ip 202.38.168.1 x121-address 20112451
broadcast packet-size 512 512
[Sysname-Serial2/0] x25 pvc 6 ip 202.38.168.3 x121-address 20112453
broadcast window-size 5 5
```

x25 queue-length

Syntax **x25 queue-length** *queue-length*

undo x25 queue-length

View Interface view

Parameter *queue-length*: Queue length in packets, ranging from 0 to 9999. The *queue-length* of 0 indicates sending no packets.

Description Use the **x25 queue-length** command to set the data queue length for X.25 VC.

Use the **undo x25 queue-length** command to restore the default.

The default is 200.

When the data traffic is too heavy, you can use this command to extend the receiving queue and sending queue of the X.25 VC to avoid data loss that may affect transmission performance. Note that modifying this parameter would not affect the existing data queue of VC. After changing the parameter, you need to restart the port with the **shutdown**/**undo shutdown** command and this will clear the current SVCs and reset the PVCs, thus change the data queue of all the VCs.

Example # Set the VC data queue length of the X.25 interface Serial 2/0 to 75 packets.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 queue-length 75
```

x25 receive-threshold

Syntax **x25 receive-threshold** *count*

undo x25 receive-threshold

View Interface view

Parameter *count*: Number of packets that can be received before acknowledgement, in the range 0 to input window size. If it is set to 0 or the input window size, this function will be disabled. If it is set to 1, X.25 of the device will send an acknowledgement for each correctly received packet.

Description Use the **x25 receive-threshold** command to set the maximum number of packets that can be received before X.25 sends the acknowledged packet.

Use the **undo x25 receive-threshold** command to restore the default.

The default is 0, that is, the function is disabled.

With this function enabled, the device can send acknowledgement to the peer upon the receipt of some correct packets, even if the input window is not yet full. If data traffic is normal, you may pay more attention to the response speed, and then you can appropriately adjust this parameter to meet the requirement.

Related command: **x25 window-size**.

Example # Specify that each VC on the X.25 interface Serial 2/0 acknowledges each correctly received data packet.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 receive-threshold 1
```

x25 response called-address

Syntax **x25 response called-address**

undo x25 response called-address

View Interface view

Parameter None

Description Use the **x25 response called-address** command to enable X.25 call reception packets to carry the address information of the called DTE.

Use the **undo x25 response called-address** command to disable the above function.

By default, this function is disabled.

According to X.25, the call reception packet may or may not carry an address code group, depending on the specific network requirements. This command enables users to easily specify whether the packet carries the called DTE address.

Related command: **x25 response calling-address**, **x25 ignore called-address**, **x25 ignore calling-address**.

Example # Specify that the call receiving packet of a call sent from the X.25 interface Serial 2/0 carries the called DTE address.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 response called-address
```

x25 response calling-address

Syntax **x25 response calling-address**

undo x25 response calling-address

View Interface view

Parameter None

Description Use the **x25 response calling-address** command to enable X.25 to carry the address information of the calling DTE in call reception packets

Use the **undo x25 response calling-address** command to restore the default.

By default, this function is disabled.

According to X.25, the call reception packet of a call may or may not carry an address code group, depending on the specific network requirements. This command enables users to easily specify whether the call reception packet carries the calling DTE address.

Related command: **x25 response called-address**, **x25 ignore called-address**, **x25 ignore calling-address**.

Example # Specify that the call reception packet of a call sent from the X.25 interface Serial 2/0 carries the calling DTE address.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 response calling-address
```

x25 reverse-charge-accept

Syntax **x25 reverse-charge-accept**

undo x25 reverse-charge-accept

View Interface view

Parameter None

Description Use the **x25 reverse-charge-accept** command to enable this interface to accept the call with the reverse charging request user facility.

Use the **undo x25 reverse-charge-accept** command to disable this function.

By default, this function is disabled.

This function does not affect any call without "reverse charging request".

If you enable this function on an X.25 interface, all these calls that reach the interface will be accepted. If you enable this function for a certain address mapping by the option **reverse-charge-accept** in the **x25 map** command, only such calls that reach the interface and map this address will be accepted, while other calls (carrying reverse charging request and not mapping this address) will be cleared.

Related command: **x25 map**.

Example # Enable Serial 2/0 to accept the call with the reverse charging request user facility.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 reverse-charge-accept
```

x25 roa-list

Syntax **x25 roa-list** *roa-name roa-id*&<1-10>

undo x25 roa-list *roa-name*

View System view

Parameter *roa-name*: Name of ROA, a string of 1 to 19 characters.

roa-id&<1-10>: ROA ID. Its value ranges from 0 to 9999. You can specify 10 IDs for the ROA.

Description Use the **x25 roa-list** command to define ROA list.

Use the **undo x25 roa-list** command to delete ROA list items.

By default, no ROA list is defined.

You can configure multiple (0 to 20. The maximum number of ROA lists supported by the system is 1,000) ROAs. After configuring ROA, you can reference it by its name in the commands **x25 call-facility** or **x25 map**.

Related command: **x25 call-facility**, **x25 map**.

Example # Define two ROA lists, and apply them to the interfaces Serial 2/0 and Serial 2/1 respectively.

```
<Sysname> system-view
[Sysname] x25 roa-list list1 11 23 45
[Sysname] x25 roa-list list2 345
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 call-facility roa-list list1
[Sysname-Serial2/0] quit
[Sysname] interface serial 2/1
[Sysname-Serial2/1] x25 call-facility roa-list list2
```

x25 switch pvc

Syntax **x25 switch pvc** *pvc-number1* **interface** *interface-type interface-number* [**dlci** *dlci-number*] **pvc** *pvc-number2* [*option*]

undo x25 switch pvc *pvc-number1*

View Interface view

Parameter *pvc-number1*: PVC number on the input interface, and its value ranges from 1 to 4095.

interface *interface-type interface-number*: Specifies an interface by its type and number.

dlci *dlci-number*: Specifies an DLCI. The *dlci-number* argument is in the range 16 to 1007.

pvc *pvc-number2*: PVC number on the output interface, and its value ranges from 1 to 4095.

option: Attribute option of PVC.

Description for options:

- **packet-size** *input-packet output-packet*: Specifies the maximum and output packet sizes in bytes, which range from 16 to 4096, and must be the integer power of 2.
- **window-size** *input-window-size output-window-size*: Specifies the input and output window sizes of the VC. When the modulo is 8, it is in the range 1 to 7; when the modulo is 128, it is in the range 1 to 127.

Description Use the **x25 switch pvc** command to configure a PVC route.

Use the **undo x25 switch pvc** command to delete a PVC route.

By default, no PVC route is defined.

Based on the X.25 switching configuration, you can use the device as a simple X.25 switch. When PVC switching is configured, the link layer protocol on the input and output interfaces must be X.25. Moreover, the specified PVCs on the two interfaces are effective. After configuring the PVC switching route, the device will receive information from the PVC of the input interface and forward the information through the specified PVC of the output interface.

You can configure X.25 PVC switching to switch from an X.25 interface to an Annex G DLCI (X.25 over FR) or vice versa, or even between Annex G DLCIs.

Two X.25 networks can be connected via an Annex G DLCI over an FR network. The Annex G DLCI can also act as a backup connection between the two X.25 networks.

You need to configure the switching route for the other interface when configuring switching; otherwise, the switching does not work.

For X.25 PVC switching, you need to specify the VC range first to make it work; otherwise, the PVC switching in the X.25 template cannot work unless you apply a new template to the FR DLCI or delete the current template.

Note that PVC switching cannot be configured on the X.25 sub-interface.

Example # Perform the packet switching from PVC1 on the Serial2/0 to PVC2 on the Serial2/1.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 switch pvc 1 interface serial 2/1 pvc 2
```

Perform the packet switching from Annex G DLCI PVC1 on the Serial2/1 to PVC1 on the Serial2/0.

```
<Sysname> system-view
[Sysname] x25 template switch
[Sysname-x25-switch] x25 vc-range bi-channel 10 20
[Sysname-x25-switch] x25 switch pvc 1 interface serial 3/0 pvc 1
[Sysname-x25-switch] quit
[Sysname] interface serial 2/1
[Sysname-Serial2/1] link-protocol fr
[Sysname-Serial2/1] fr interface-type dce
[Sysname-Serial2/1] fr dlci 100
[Sysname-fr-dlci-Serial2/1-100] annexg dce
[Sysname-fr-dlci-Serial2/1-100] x25-template switch
[Sysname-fr-dlci-Serial2/1-100] quit
[Sysname-Serial2/1] quit
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol x25 dce
[Sysname-Serial2/0] x25 switch pvc 1 interface serial2/1 dlci 100 pvc 1
```

x25 switch svc

Syntax **x25 switch svc** [*-number*] *x.121-address* [**sub-dest** *destination-address*] **sub-source** *source-address*] **interface** *interface-type interface-number* [**dlci** *dlci-number*]

undo x25 switch svc *x.121-address* [**sub-dest** *destination-address*] [**sub-source** *source-address*] [**interface** *interface-type interface-number*]

View System view

Parameter *x.121-address*: Destination X.121 address, a pattern matching string with 1 to 15 numeric characters. For the specific description of mode matching, see the following description. If no wildcard is used, the X.121 address should be exactly matched.

Table 69 X.121 mode matching rules

Wildcard characters	Matching rules	Example	Matchable character string
*	Matching zero or more previous characters	fo*	fo, foo, fooo
+	Matching one or more previous characters	fo+	foo, fooo
^	Matching the beginning of the entered characters	^hell	hell, hello, hellaaa
$	Matching the end of the entered characters	ar$	ar, car, hear
char	Matching a single character specified by char.	s	bs
.	Matching arbitrary single character	l.st	last, lbst, lost

Table 69 X.121 mode matching rules

Wildcard characters	Matching rules	Example	Matchable character string
.*	Matching arbitrary zero or more characters	fo.*	fo, foo, fot
.+	Matching arbitrary one or more characters	fo.+	foo, fot, foot

Table 70 Input rules of X.121 address mode matching string

Characters	Input rules
*	Cannot be placed at the beginning of character string
	Cannot be placed after the symbol ^
	Cannot be placed before and after the symbols + and *.
+	Cannot be placed at the beginning of character string
	Cannot be placed after the symbol ^
	Cannot be placed before and after the symbols + and *.
	Cannot be placed at the end of character string
^	Cannot be placed before the symbols + and *.

-number: SVC route number.

sub-dest *destination-address*: Replaces the destination X.121 address, an alphanumeric string of 1 to 15 characters. The system replaces the destination DTE address in the call request packet with the *destination-address*.

sub-source *source-address*: Replaces the source X.121 address, an alphanumeric string of 1 to 15 characters. The system replaces the source DTE address in the call request packet with the *source-address*.

interface *interface-type interface-number*: Interface type and interface number.

dlci *dlci-number*: Specifies an DLCI. The *dlci-number* argument is in the range 16 to 1007.

Description

Use the **x25 switch svc** command to configure an SVC (switching virtual circuit), indicating the packet to be forwarded to the destination address through the specified interface.

Use the **undo x25 switch svc** command to delete the SVC route.

A device with X.25 switching configured can act as a simple X.25 switch.

The output interface of the SVC switching can be an X.25 interface, or FR interface Annex G DLCI. The link layer of the output interface must be X.25, or FR with the Annex G DLCI configured for output.

Before using this command, you should use the **x25 switching** command to enable X.25 switching.

By default, no SVC is defined.

Example # Configure an SVC to forward the packet to the X.121 address 20112451 through interface Serial2/0.

```
<Sysname> system-view
[Sysname-Serial2/0] x25 switch svc 20112451 interface serial 2/0
```

Configure an SVC to forward the packet to the address 3 through the Annex G DLCI 100 of interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol fr
[Sysname-Serial2/0] fr dlci 100
[Sysname-Serial2/0] annexg dce
[Sysname-Serial2/0] quit
[Sysname] x25 switch svc 3 interface serial 2/0 dlci 100
```

x25 switch svc hunt-group

Syntax **x25 switch svc** *x.121-address* [**sub-dest** *destination-address* | **sub-source** *source-address*] * **hunt-group** *hunt-group-name*

undo x25 switch svc *x.121-address* [**sub-dest** *destination-address*] [**sub-source** *source-address*] [**hunt-group** *hunt-group-nam*e]

View System view

Parameter *x.121-address*: Destination X.121 address, a pattern matching string with 1 to 15 numeric characters. For the specific description of pattern matching, see Table 69 and Table 70. If no wildcard is used, the X.121 address is must be exactly matched.

sub-dest *destination-address*: X.121 address, an alphanumeric string of 1 to 15 characters. The system replaces the destination DTE address in the call request packet with the *destination-address*.

sub-source *source-address*: X.121 address, an alphanumeric string of 1 to 15 characters. The system replaces the source DTE address in the call request packet with the *source-address*.

hunt-group *hunt-group-name*: Specifies a hunt group.

Description Use the **x25 switch svc hunt-group** command to add an X.25 switching SVC whose forwarding address is a hunt group.

Use the **undo x25 switch svc hunt-group** command to delete the specified X.25 switching SVC.

By default, no X.25 switching SVC is configured.

Note that:

- After the X.25 switching SVC with forwarding address being a hunt group is configured, the relevant X.25 call request packet will be forwarded to different

interfaces or XOT channels in the specified hunt group, to implement the load sharing of X.25 protocol.

- X.25 hunt group supports source address and destination address replacement. With destination address replacement, you can hide X.121 address of DTE inside the hunt group so that the outside DTE knows only the X.121 address of the hunt group, therefore enhancing network security inside the hunt group. With source address replacement, you can hide X.121 address of DTE outside the hunt group so that the inside DTE knows only the source X.121 address after replacement but not the source X.121 address the call connects, therefore protecting you privacy.

Related command: **display x25 switch-table svc**.

Example # Add an X.25 switching SVC, whose destination X.121 address is 111 and forwarding address is the hunt group hg1, and substitute the destination address with 9999 and the source address with 8888.

```
<Sysname> system-view
[Sysname] x25 switch svc 111 sub-dest 9999 sub-source 8888 hunt-group hg1
```

x25 switch svc xot

Syntax **x25 switch svc** *x.121-address* [**sub-dest** *destination-address* | **sub-source** *source-address*] * **xot** *ip-address*&<1-6> [*xot-option*]

undo x25 switch svc *x.121-address* [**sub-dest** *destination-address*] [**sub-source** *source-address*] [**xot** *ip-address*&<1-6>]

View System view

Parameter *x.121-address*: Destination address of X.121, a mode matching string with a 1 to 15 numeric characters. For the specific description of mode matching, see Table 69 and Table 70. If no wildcard is used, the X.121 address must exactly match.

sub-dest *destination-address*: X.121 address, a string of 1 to 15 characters. The system replaces the destination DTE address in the call request packet with the *destination-address*.

sub-source *source-address*: X.121 address, a string of 1 to 15 characters. The system replaces the source DTE address in the call request packet with the *source-address*.

xot *ip-address*&<1-6>: Destination IP address of XOT connection, up to 6 addresses can be configured.

xot-option: XOT channel parameter option. For the specific configuration, see Table 71.

Table 71 XOT channel parameter option

Option	Description
timer *seconds*	Keepalive timer delay of XOT connection. The timer sends the keepalive packet upon timeout to detect the connection availability. Its value ranges from 1 to 3600.
retry *times*	Number of maximum retries of sending keepalive. If the number exceeds times, the XOT connection will be disconnected. Its value ranges from 3 to 3600.
source *interface-type interface-number*	Type and number of the interface that initiates the XOT connection.

Description Use the **x25 switch svc xot** command to add an X.25 switching route whose forwarding address is XOT channel.

Use the **undo x25 switch svc xot** command to delete the specified X.25 switching route.

By default, no X.25 switching route is configured.

After configuring the XOT switching command of X.25 SVC, a user can cross IP network from the local X.25 network to implement the interconnection with the remote X.25 network. If a user configures the keepalive attribute, the link detection for XOT will be supported.

Example # Configure a XOT route and forward the packet whose destination X.121 address is 1 to the destination address whose IP address is 10.1.1.1.

```
<Sysname> system-view
[Sysname] x25 switch svc 1 xot 10.1.1.1
```

x25 switching

Syntax **x25 switching**

undo x25 switching

View System view

Parameter None

Description Use the **x25 switching** command to enable the X.25 switching function.

Use the **undo x25 switching** command to disable this function, which will not affect the established VC switching.

By default, X.25 packet switching function is disabled.

X.25 packet switching is used to accept packets from an X.25 interface and send them to a certain interface based on the destination information contained in the packets. The device with this function can be used as a small-sized packet switch.

Example # Enable X.25 switching function.

```
<Sysname> system-view
[Sysname] x25 switching
```

x25 timer hold

Syntax **x25 timer hold** *minutes*

undo x25 timer hold

View Interface view

Parameter *minutes*: Value of delay time in minutes, in the range 0 to 1000.

Description Use the **x25 timer hold** command to set the delay for sending another calling request to a destination to which a previous request failed to reach.

Use the **undo x25 timer hold** command to restore the default.

By default, the delay time is 0 second.

Frequently sending call requests to a wrong destination (which does not exist or is faulty) will deteriorate the operating efficiency of the device. Using this function can avoid this problem to a certain extent. If the previous call failed at one destination, the X.25 would not send calls to such a destination again within the specified time.

If this parameter is set to 0, it is equal to disabling the function. In addition, this function is only effective to the calls originating from the local. That is to say, this parameter is meaningless when the X.25 operates in the switching mode.

Example # Set the delay of the X.25 interface Serial 2/0 to 5 minutes.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 timer hold 5
```

x25 timer idle

Syntax **x25 timer idle** *minutes*

undo x25 timer idle

View Interface view

Parameter *minutes*: Maximum idle time of SVC in minutes, ranging from 0 to 255.

Description Use the **x25 timer idle** command to set the maximum idle time of the SVC on the interface.

Use the **undo x25 timer idle** command to restore the default.

By default, this value is 0.

Note that:

- When a SVC stays idle (no data are transmitted) for a period specified with the **x25 timer idle** command, the router will clear this SVC automatically.
- The **x25 timer idle** command applies to all the SVCs under the interface. You can also use the options in the **x25 map** command to configure the maximum idle time for the SVC related to the address mapping and the priority is higher than the configuration of the interface.
- If the value is set to 0, this SVC will be reserved no matter how long it stays idle.
- Using this command does not work for PVC or the established SVC of X.25 switching.

Related command: **x25 map**.

Example # Set the maximum idle time of the SVC on the interface Serial 2/0 to 10 minutes.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 timer idle 10
```

x25 timer tx0

Syntax **x25 timer tx0** *seconds*

undo x25 timer tx0

View Interface view

Parameter *seconds*: X.25 restart timer in seconds. It ranges 0 to 1000.

Description Use the **x25 timer tx0** command to set the restart timer for DTE (or DCE).

Use the **undo x25 timer tx0** command to restore the default.

The default restart timer on the X.25 DTE is 180 seconds and that on the DCE is 60 seconds.

According to X.25, a timer should be started when the DTE sends a restart request (or a DCE sends a restart indication). If no peer acknowledgement is received after the timer timeout, the sending end will take some measures to guarantee the normal proceeding of the local procedure. This parameter specifies the time of this timer.

Related command: **x25 timer tx1**, **x25 timer tx2**, **x25 timer tx3**.

Example # Set the restart timer on the X.25 interface Serial 2/0 to 120 seconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 timer tx0 120
```

x25 timer tx1

Syntax **x25 timer tx1** *seconds*

undo x25 timer tx1

View Interface view

Parameter *seconds*: Time of calling request (indication) sending timer in seconds, ranging from 0 to 1000.

Description Use the **x25 timer tx1** command to set calling request (indication) sending timer for the DTE (or DCE).

Use the **undo x25 timer tx1** command to restore the default.

By default, the timer time on a DTE is 200 seconds, and that on a DCE is 180 seconds.

According to X.25, a timer should be started when the DTE sends a call request (or the DCE sends a call indication). If no peer acknowledgement is received after the timer timeout, the sending end will take some measures to guarantee the normal proceeding of the local procedure. This parameter specifies the time of this timer.

Related command: **x25 timer tx0**, **x25 timer tx2**, **x25 timer tx3**.

Example # Set calling request (indication) sending timer on the X.25 interface Serial2/0 to 100 seconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 timer tx1 100
```

x25 timer tx2

Syntax **x25 timer tx2** *seconds*

undo x25 timer tx2

View Interface view

Parameter *seconds*: Reset request (indication) timer in seconds, ranging from 1 to 1000.

Description Use the **x25 timer tx2** command to set the reset request (indication) timer for DTE (or DCE).

Use the **undo x25 timer tx2** command to restore the default.

By default, the timer on a DTE is 180 seconds, and that on a DCE is 60 seconds.

According to X.25, a timer should be started when a DTE sends a reset request (or a DCE sends a reset indication). If no peer acknowledgement is received after the timer timeout, the sending end will take some measures to guarantee the normal proceeding of the local procedure.

Related command: **x25 timer tx0**, **x25 timer tx1**, **x25 timer tx3**.

Example # Set the reset timer on the X.25 interface Serial1/0 to 120 seconds.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] x25 timer tx2 120
```

x25 timer tx3

Syntax **x25 timer tx3** *seconds*

undo x25 timer tx3

View Interface view

Parameter *seconds*: Time of the clear request (indication) sending timer in seconds, ranging from 1 to 1000.

Description Use the **x25 timer tx3** command to set the clear request (indication) sending timer for DTE (or DCE).

Use the **undo x25 timer tx3** command to restore the default.

By default, the clear timer on a DTE is 180 seconds, and that on a DCE is 60 seconds.

According to X.25, a timer should be started when a DTE sends a clear request (or a DCE sends a clear indication). If no peer acknowledgement is received after the timer timeout, the sending end will take some measures to guarantee the normal proceeding of the local procedure.

Related command: **x25 timer tx0**, **x25 timer tx1**, **x25 timer tx2**.

Example # Set the clear timer on the X.25 interface Serial 2/0 to 100 seconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 timer tx3 100
```

x25 vc-per-map

Syntax **x25 vc-per-map** *count*

undo x25 vc-per-map

View Interface view

Parameter *count*: Maximum number of VCs, ranging from 1 to 8.

Description Use the **x25 vc-per-map** command to set the maximum number of VCs for connections with the same destination device.

Use the **undo x25 vc-per-map** command to restore the default.

The default is 1.

If the parameter is greater than 1, and the sending window and the sending queue of VC are filled full, the system will create a new VC to the same destination. If the new VC cannot be created, packets will be discarded.

Example # Set the maximum value of VCs on the X.25 interface Serial 2/0 to 3.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 vc-per-map 3
```

x25 vc-range

Syntax **x25 vc-range** { **bi-channel** *ltc htc* [**out-channel** *loc hoc*] | **in-channel** *lic hic* [**bi-channel** *ltc htc*] [**out-channel** *loc hoc*] | **out-channel** *loc hoc* }

undo x25 vc-range

View Interface view

Parameter **bi-channel** *ltc htc*: Lowest and highest two-way channels of X.25 VC, and its value ranges from 0 to 4095. If *htc* (highest two-way channel) is set to 0, *ltc* (lowest two-way channel) must also be set to 0, which indicates that the two-way channel section is disabled.

out-channel *lic hic*: Lowest and highest incoming-only channels of X.25 VC, and its value ranges from 0 to 4095. If *hic* (highest incoming-only channel) is set to 0, *lic* (lowest incoming-only channel) must also be set to 0, which indicates that the incoming-only channel section is disabled.

in-channel *loc hoc*: Lowest and highest outgoing-only channels of X.25 VC, and its value ranges from 0 to 4095. If *hoc* (highest outgoing-only channel) is set to 0, *loc* (lowest outgoing-only channel) must also be set to 0, which indicates that the outgoing-only channel section is disabled.

Description Use the **x25 vc-range** command to set the upper and lower limits of X.25 VC range.

Use the **undo x25 vc-range** command to restore their default values.

By default, the upper and lower limits of two-way channel are 1 and 1024, of incoming-only channel are both 0, and of outgoing-only channel are both 0.

By default, X.25 bans the incoming-only and outgoing-only channel sections and reserves only the double direction channel section (in the range 1 to 1024). Please configure the range correctly according to your ISP's requirement.

Example # Configure the incoming-only, two-way and outgoing-only channel ranges as [1, 7], [8, 1024] and [0, 0] respectively.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 vc-range in-channel 1 7 bi-channel 8 1024
```

x25 window-size

Syntax **x25 window-size** *input-window-size output-window-size*

undo x25 window-size

View Interface view

Parameter *input-window-size*: Size of input window. When X.25 window modulo is 8, its value ranges from 1 to 7. When X.25 window modulo is 128, its value ranges from 1 to 127.

output-window-size: Size of output window. When X.25 window modulo is 8, its value ranges from 1 to 7. When X.25 window modulo is 128, its value ranges from 1 to 127.

Description # Set calling request (indication) sending timer on the X.25 interface Serial2/0 to 100 seconds.

Use the **undo x25 window-size** command to restore their default values.

The default sizes are both 2.

The *input-window-size* determines the maximum number of correctly received packets before X.25 sends the acknowledgement information. As long as the bandwidth allows, the greater the window size, the higher the transmission efficiency.

The parameter *out-window-size* determines the maximum number of data packets sent by X.25 before it receives the correct acknowledgment information. As long as the bandwidth allows, the greater the window size, the higher the transmission efficiency.

Please consult your ISP about the input and output window sizes. Unless supported by the network, do not set these two parameters to different values.

Example # Set the input and output window sizes on the X.25 interface Serial 2/0 to 5.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 window-size 5 5
```

x25 x121-address

Syntax **x25 x121-address** *x.121-address*

undo x25 x121-address

View Interface view

Parameter *x.121-address*: X.121 address, an alphanumeric string of 1 to 15 characters.

Description Use the **x25 x121-address** command to set the X.121 address of an X.25 interface.

Use the **undo x25 x121-address** command to delete the address.

Note that:

- If the device is accessed to X.25 public packet network, the ISP must assign a valid X.121 address to it. If two devices are only directly connected back to back, you can randomly specify the valid X.121 address. If you only want the device to work in switching mode, the X.121 address needs not to be configured.
- When you reconfigure an X.121 address for an X.25 interface, you need not delete the original X.121 address, because the new address will overwrite the old one.

For the format of the X.121 address and the dynamic conversion between IP address and X.121 address, please refer to *ITU-T Recommendation X.121* and the relevant RFC document.

Example # Configure the X.121 address of the interface Serial 2/0 as 20112451.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] x25 x121-address 20112451
```

x25 xot pvc

Syntax **x25 xot pvc** *pvc-number1 ip-address* **interface** *interface-type interface-number* **pvc** *pvc-number2* [*xot-option* | **packet-size** *input-packet output-packet* | **window-size** *input-window-size output-window-size*]*

undo x25 pvc *pvc-number1*

View Interface view

Parameter *pvc-number1*: Number of PVC on the local interface, in the range 1 to 4095.

ip-address: IP address of the peer on the XOT connection.

interface *interface-type interface-number*: Specifies an interface by its type and number.

pvc *pvc-number2*: Specifies a PVC on the peer interface. The *pvc-number2* argument is in the range 1 to 4095.

xot-option: XOT channel parameter option. For specific configuration, see Table 72.

Table 72 XOT channel parameter option

Option	Description
timer *seconds*	Keepalive timer delay of XOT connection. The timer sends the keepalive packet upon timeout to detect the connection availability. Its value ranges from 1 to 3600.
retry *times*	Number of maximum retries for sending keepalives. If the number exceeds *times*, the XOT connection will be disconnected. Its value ranges from 3 to 3600.
source *interface-type interface-number*	Type and number of the interface that initiates the XOT connection.

packet-size *input-packet output-packet*: Specifies the maximum input and output packet lengths in bytes, in the range 16 to 4,096. The sizes must be an integer power of 2.

window-size *input-window-size output-window-size*: Specifies the input and output window sizes of the VC. If the modulo of the PVC's interface is 8, the values are in the range 1 to 7; if the modulo is 128, the values are in the range 1 to 127.

Description Use the **x25 xot pvc** command to add a PVC route of XOT.

Use the **undo x25 pvc** command to delete the specified PVC route of XOT.

By default, no PVC route of XOT is configured.

XOT (X.25 Over TCP) is a protocol to load X.25 packet over TCP. Configuring the XOT switching PVC can connects the local X.25 network to the remote one over the IP network. You can also configure the keepalive attribute to support link detection.

Related command: **display x25 vc**, **x25 switching**.

Example # Configure an XOT PVC route to forward packets from PVC1 to the device at 10.1.1.2, which then forwards the packets out PVC2 on Serial 2/0.

```
<Sysname> system-view
[Sysname] x25 switching
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip address 10.1.1.1 255.255.255.0
[Sysname-Ethernet1/0] quit
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol x25 dce ietf
[Sysname-Serial2/0] x25 xot pvc 1 10.1.1.2 interface serial 2/0 pvc 2
```

x29 timer inviteclear-time

Syntax **x29 timer inviteclear-time** *seconds*

undo x29 timer inviteclear-time

View System view

Parameter *seconds*: Delay time in seconds, in the range 5 to 2147483. The delay waiting for response after inviting PAD clear procedure.

Description Use the **x29 timer inviteclear-time** command to set the delay waiting for response after the PAD clear procedure is initiated. Upon expiration of this timer, the server aborts the connection by force and starts X.25 clear procedures.

Use the **undo x29 timer inviteclear-time** command to restore the default.

The default is 5 seconds.

The server of X.25 PAD may send an Invite Clear message to the client, for example, after receiving a quit request from client or in order to release the link. At the same time, a timer is started. If no response is received upon expiration of the timer, the server clears the link.

Example # Set the delay waiting for response after the PAD clear procedure is initiated to 1000 seconds.

```
<Sysname> system-view
[Sysname] x29 timer inviteclear-time 1000
```

27 LINK AGGREGATION CONFIGURATION COMMANDS

Link aggregation is not supported on MSR 20 series routers. It is only supported on the interfaces of 16FSW/24FSW modules of MSR 30/MSR 50 series routers.

display lacp system-id

Syntax **display lacp system-id**

View Any view

Parameter None

Description Use the **display lacp system-id** command to display the local system ID (also called the actor system ID), which comprises the system LACP priority and the system MAC address.

Example # Display the local system ID.

```
<Sysname> display lacp system-id
 Actor System ID: 0x8000, 00e0-fc00-0100
```

display link-aggregation interface

Syntax **display link-aggregation interface** *interface-type interface-number* [**to** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number* [**to** *interface-type interface-number*]: Specifies a port range or a port if the **to** keyword and the second port are not specified.

Description Use the **display link-aggregation interface** command to display detailed information about link aggregation for the specified port or ports.

You may find that information about the remote system is replaced by 0 and no statistics about LACPDUs are provided for manual link aggregation groups. This is normal because this type of aggregation group has no knowledge of its partner and does not use LACP PDUs for maintaining link aggregation.

Example # Display detailed information about link aggregation for port Ethernet 1/1 in a manual aggregation group.

```
<Sysname> display link-aggregation interface ethernet 1/1
Flags:  A -- LACP_Activity, B -- LACP_timeout, C -- Aggregation,
         D -- Synchronization, E -- Collecting, F -- Distributing,
         G -- Defaulted, H -- Expired

 Ethernet1/1:
   Selected AggID: 1
   Local:
     Port-Priority: 32768, Oper key: 1, Flag: {}
   Remote:
     System ID: 0x0, 0000-0000-0000
     Port Number: 0, Port-Priority: 0, Oper-key: 0, Flag: {}
```

Display detailed information about link aggregation for port Ethernet 1/2 in a static aggregation group.

```
<Sysname> display link-aggregation interface ethernet 1/2
Flags:  A -- LACP_Activity, B -- LACP_timeout, C -- Aggregation,
         D -- Synchronization, E -- Collecting, F -- Distributing,
         G -- Defaulted, H -- Expired

Ethernet1/2:
   Selected AggID: 20
   Local:
     Port-Priority: 32768, Oper key: 2, Flag: {ACDEF}
   Remote:
     System ID: 0x8000, 000e-84a6-fb00
     Port Number: 2, Port-Priority: 32768 , Oper-key: 10, Flag: {ACDEF}
   Received LACP Packets: 8 packet(s), Illegal: 0 packet(s)
   Sent LACP Packets: 9 packet(s)
```

Table 73 Description on the fields of display link-aggregation interface

Field	Description
Flags	One-octet LACP state flags field. From the least to the most significant bit, they are represented by A through H as follows: ■ A indicates whether LACP is enabled, 1 for enabled and 0 for disabled. ■ B indicates the timeout control value, 1 for short timeout, and 0 for long timeout. ■ C indicates whether the sending system considers this link to be aggregatable, 1 for true, and 0 for false. ■ D indicates whether the sending system considers that this link is synchronized, 1 for true, and 0 for false. ■ E indicates whether the sending end considers that collection of incoming frames is enabled on the link, 1 for true and 0 for false. ■ F indicates whether the sending system considers that distribution of outgoing frames is enabled on the link, 1 for true and 0 for false. ■ G indicates whether the receive state machine of the sending system is using default operational partner information, 1 for true and 0 for false. ■ H indicates whether the receive state machine of the sending system is in the expired state, 1 for true and 0 for false. If a flag bit is set to 1, the corresponding English letter that otherwise is not output displays.
Selected AggID	ID of the link aggregation group of which this port is a member
Local: Port-Priority, Oper key, Flag	Local port LACP priority, operational key, LACP state flag
Remote: System ID, Port Number, Port-Priority, Oper-key, Flag	Remote system ID, port number, port LACP priority, operational key, and LACP state flag
Received LACP Packets, Illegal, Sent LACP Packets	Statistics about received, invalid, and sent LACP packets

display link-aggregation summary

Syntax **display link-aggregation summary**

View Any view

Parameter None

Description Use the **display link-aggregation summary** command to display a summary for all link aggregation groups.

You may find that information about the remote system for a manual link aggregation group is either replaced by none or not displayed at all. This is normal because this type of aggregation group has no knowledge of its partner.

Example # Display the link aggregation group summary.

```
<Sysname> display link-aggregation summary
Aggregation Group Type: S -- Static, M -- Manual
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Actor ID: 0x8000, 00e0-fcff-ff04

  AL     AL  Partner ID           Select    Unselect    Share   Master
  ID     Type                     Ports Ports   Type        Port
------------------------------------------------------------------------
  10     M   none                  1        0       NonS        Ethernet1/2
  20     S   0x8000,00e0-fcff-ff01 1        0       NonS        Ethernet1/3
```

Table 74 Description on the fields of display link-aggregation summary

Field	Description
Aggregation Group Type	Aggregation group type. ■ S: static LACP aggregation ■ M: manual aggregation
Loadsharing Type	Load sharing type, which can be "Shar" (for load sharing) and "NonS" (for non-load sharing).
Actor ID	Local system ID
AL ID	Link aggregation group ID
AL Type	Link aggregation type, which can be dynamic LACP aggregation, static LACP aggregation, or manual aggregation.
Partner ID	Remote system ID
Select Ports	Number of selected ports
Unselect Ports	Number of unselected ports
Share Type	Load sharing type
Master Port	Master port

display link-aggregation verbose

Syntax **display link-aggregation verbose** [*agg-id*]

View Any view

Parameter *agg-id*: ID of an existing link aggregation group, in the range 1 to 144.

Description Use the **display link-aggregation verbose** command to display detailed information about the specified or all link aggregation groups.

You may find that information about the remote system for a manual link aggregation group is either replaced by none or not displayed at all. This is normal because this type of aggregation group has no knowledge of its partner.

Example # Display detailed information about all the link aggregation groups.

```
<Sysname> display link-aggregation verbose
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Flags:  A -- LACP_Activity, B -- LACP_timeout, C -- Aggregation,
        D -- Synchronization, E -- Collecting, F -- Distributing,
        G -- Defaulted, H -- Expired

Aggregation ID: 1,  AggregationType: Static,   Loadsharing Type: Shar
Aggregation Description:

```

Table 75 Description on the fields of display link-aggregation verbose

Field	Description
Loadsharing Type	Load sharing type, either shar for loadsharing or NonS for non-load sharing

Table 75 Description on the fields of display link-aggregation verbose

Field	Description
Flags	One-octet LACP flags field indicates the actor state variables for the port. From the least to the most significant bit, they are represented by A through H as follows: ■ A indicates the enabling/disabling state of LACP, 1 for enabled and 0 for disabled ■ B indicates the timeout control value, 1 for short timeout, and 0 for long timeout ■ C indicates whether the sending system considers this link to be aggregatable, 1 for true, and 0 for false ■ D indicates whether the sending system considers that this link is synchronized, 1 for true, and 0 for false ■ E indicates whether the sending system considers that collection of incoming frames is enabled on the link, 1 for true and 0 for false ■ F indicates whether the sending system considers that distribution of outgoing frames is enabled on the link, 1 for true and 0 for false ■ G indicates whether the receive state machine of the sending system is using default operational partner information, 1 for true and 0 for false ■ H indicates whether the receive state machine of the sending system is in the expired state, 1 for true and 0 for false If a flag bit is set to 1, the corresponding English letter that otherwise is not output displays.
Aggregation ID	Link aggregation group ID
AggregationType	Link aggregation type: manual LACP or static LACP
Aggregation Description	Link aggregation group name
System ID	Local system ID
Port State	Port state in a link aggregation group: selected or unselected
Local: Port, Status, Priority, Oper-key, Flag	Other information about the local end, including member ports, port state, port LACP priority, operational key, and flags
Remote: Actor, Partner, Priority, Oper-key, SystemID, Flag	Detailed information about the remote end, including corresponding local port, port ID, port LACP priority, operational key, system ID, and flags

lacp port-priority

Syntax **lacp port-priority** *port-priority*

undo lacp port-priority

View Ethernet interface view

Parameter *port-priority*: Port LACP priority, in the range 0 to 65535.

Description Use the **lacp port-priority** command to assign an LACP priority to the port.

Use the **undo lacp port-priority** command to restore the default.

By default, port LACP priority is 32768.

Related command: **display link-aggregation interface**, **display link-aggregation verbose**.

Example # Assign LACP priority 64 to a port.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] lacp port-priority 64
```

lacp system-priority

Syntax **lacp system-priority** *system-priority*

undo lacp system-priority

View System view

Parameter *system-priority*: System LACP priority, in the range 0 to 65535.

Description Use the **lacp system-priority** command to assign an LACP priority to the local system.

Use the **undo lacp system-priority** command to restore the default.

By default, system LACP priority is 32768.

Example # Assign LACP priority 64 to the local system.

```
<Sysname> system-view
[Sysname] lacp system-priority 64
```

link-aggregation group description

Syntax **link-aggregation group** *agg-id* **description** *agg-name*

undo link-aggregation group *agg-id* **description**

View System view

Parameter *agg-id*: Link aggregation group ID, in the range 1 to 144.

agg-name: Link aggregation group name, a string of 1 to 32 characters.

Description Use the **link-aggregation group description** command to configure a name for the specified link aggregation group.

Use the **undo link-aggregation group description** command to remove the name of the specified link aggregation group.

Related command: **display link-aggregation verbose**.

Example # Name link aggregation group 22 as abc.

```
<Sysname> system-view
[Sysname] link-aggregation group 22 description abc
```

link-aggregation group mode

Syntax **link-aggregation group** *agg-id* **mode** { **manual** | **static** }

undo link-aggregation group *agg-id*

View System view

Parameter *agg-id*: Link aggregation group ID, in the range 1 to 144.

manual: Creates a manual link aggregation group.

static: Creates a static LACP link aggregation group.

Description Use the **link-aggregation group mode** command to create a link aggregation group.

Use the **undo link-aggregation group** command to remove a link aggregation group.

Note that aggregation groups currently referenced by modules cannot be removed.

Related command: **display link-aggregation summary**.

Example # Create manual link aggregation group 22.

```
<Sysname> system-view
[Sysname] link-aggregation group 22 mode manual
```

port link-aggregation group

Syntax **port link-aggregation group** *agg-id*

undo port link-aggregation group

View Ethernet interface view

Parameter *agg-id*: Link aggregation group ID, in the range 1 to 144.

Description Use the **port link-aggregation group** command to add the Ethernet port to a link aggregation group (manual or static LACP).

Use the **undo port link-aggregation group** command to remove the Ethernet port from a link aggregation group.

Related command: **display link-aggregation verbose**.

Example # Assign port Ethernet 1/0 to link aggregation group 22.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port link-aggregation group 22
```

port-group aggregation

Syntax **port-group aggregation** *agg-id*

View System view

Parameter *agg-id*: Aggregation port group ID, in the range 1 to 144.

Description Use the **port-group aggregation** command to enter aggregation port group view.

Instead of being created administratively, an aggregation port group is created automatically upon creation of a link aggregation group and assigned the ID of the link aggregation group. In aggregation port group view, you can configure aggregation related settings such as STP, VLAN, QoS, GVRP, and MAC address learning, but cannot add or remove member ports.

Example # Enter aggregation port group view.

```
<Sysname> system-view
[Sysname] port-group aggregation 10
[Sysname-port-group-aggregation-10]
```

reset lacp statistics

Syntax **reset lacp statistics** [**interface** *interface-type interface-number* [**to** *interface-type interface-number*]]

View User view

Parameter **interface** *interface-type interface-number* [**to** *interface-type interface-number*]: Specifies an interface range or an interface if the **to** keyword and the second interface are not specified.

Description Use the **reset lacp statistics** command to clear statistics about LACP on a specified port or ports.

Related command: **display link-aggregation interface**.

Example # Clear statistics about LACP on all ports.

```
<Sysname> reset lacp statistics
```

28 LINK AGGREGATION DEBUGGING COMMANDS

debugging lacp packet

Syntax **debugging lacp packet** [**interface** *interface-type interface-number* [**to** *interface-type interface-number*]]

undo debugging lacp packet [**interface** *interface-type interface-number* [**to** *interface-type interface-number*]]

View User view

Default Level 1: Monitor level

Parameters *interface-type interface-number*: Port type and port number.

to: Specifies the ports with their port type and port number within the port range enclosed by the two *interface-type-interface-number* argument pairs around this keyword.

Description Use the **debugging lacp packet** command to enable debugging for LACP protocol packets on the specified port(s).

Use the **undo debugging lacp packet** command to disable debugging for LACP protocol packets on the specified port(s).

By default, debugging for LACP protocol packets is disabled on a port.

If no port is specified, the command applies to all the ports running LACP.

Table 76 Description on the fields of the debugging lacp packet command

Field	Description
size	Size of a protocol packet, which is 128 bytes.
subtype	Sub type of a protocol packet, which is 1 for LACP protocol packets.
version	Protocol version, which is 1 for LACP.

Table 76 Description on the fields of the debugging lacp packet command

Field	Description
Actor	Local port information carried in the protocol packet, which contains the following fields. ■ **tlv**: A value of 1 indicates that the information is about the local port. ■ **len**: The length of the Actor information. ■ **sys-pri**: The LACP priority of the system where the local port resides. ■ **sys-mac**: The system MAC address of the system where the local port resides. ■ **key**: The value of the operation key of the local port. ■ **pri**: The LACP priority of the local port. ■ **p**: The local port number. ■ **state**: The current LACP state of the local port.
Partner	Peer port information carried in the protocol packet, which contains the following fields. ■ **tlv**: A value of 2 indicates that the information is about the peer port. ■ **len**: The length of the Partner information. ■ **sys-pri**: The LACP priority of the system where the peer port resides. ■ **sys-mac**: The system MAC address of the system where the peer port resides. ■ **key**: The value of the operation key of the peer port. ■ **pri**: The LACP priority of the peer port. ■ **p**: The peer port number. ■ **state**: The current LACP state of the peer port.
Collector	The content of the Collector field carried in the protocol packet, which contains the following fields. ■ **tlv**: A value of 3 indicates the Collector field. ■ **len**: The length of the Collector field. ■ **col-max-delay**: The maximum delay.
Terminator	The content of the Terminator field carried in the protocol packet, which contains the following fields. ■ **tlv**: A value of 0 indicates the Terminator field, which marks the end of the protocol packet. ■ **len**: The length of the Terminator field.

Examples # Enable debugging for LACP protocol packets on Ethernet 1/1 to view the information about LACP protocol packet sending/receiving of the port.

```
<Sysname> debugging lacp packet interface ethernet 1/1
*0.60323 Sysname LAGG/8/Pkt:
 Send LACP Packet via port Ethernet1/1
```

// The device sent an LACP protocol packet through Ethernet 1/1.

```
*0.60323 Sysname LAGG/8/Pkt:
 size=128, subtype =1, version=1
```

// The length of the LACP packet was 128 bytes, the protocol sub type was 1, and the version number was 1.

// The local port information carried in the packet was as follows:

- *length: 20*
- *system LACP priority: 0x8000*
- *system MAC address: 00e0-fc02-0300*
- *port operation key: 0x1*
- *port LACP priority: 0x8000*
- *port number: 0x2*
- *current LACP state flag of the port: 0x45*

```
Partner: tlv=2, len=20, sys-pri=0x0, sys-mac=0000-0000-0000, key=0x0
, pri=0x0, p=0x0, state=0x0
```

// The peer port information carried in the packet was as follows:

- *length: 20*
- *system LACP priority: 0x0*
- *system MAC address: 0000-0000-0000*
- *port operation key: 0x0*
- *port LACP priority: 0x0*
- *port number: 0x0*
- *current LACP state flag of the port: 0x0*

```
Collector: tlv=3, len=16, col-max-delay=0
```

// The content of the Collector field in the protocol packet was as follows:

- *length: 16*
- *maximum delay: 0*

```
Terminator: tlv=0, len=0
```

// The length of the Terminator field in the protocol packet is 0.

```
*0.1221133 Sysname LAGG/8/Pkt:
 Receive LACP Packet via port Ethernet1/1
```

// The device received an LACP protocol packet through Ethernet 1/1.

```
*0.1221133 Sysname LAGG/8/Pkt:
 size=128, subtype =1, version=1
```

// The length of the LACP packet was 128 bytes, the protocol sub type was 1, and the version number was 1.

```
Actor: tlv=1, len=20, sys-pri=0x8000, sys-mac=00e0-fc00-0000, key=0x
1, pri=0x8000, p=0x6, state=0x3d
```

// The local port information carried in the packet was as follows:

- *length: 20*
- *system LACP priority: 0x8000*
- *system MAC address: 00e0-fc00-0000*
- *port operation key: 0x1*
- *port LACP priority: 0x8000*
- *port number: 0x6*
- *current LACP state flag of the port: 0x3d*

```
Partner: tlv=2, len=20, sys-pri=0x8000, sys-mac=00e0-fc02-0300, key=
0x1, pri=0x8000, p=0x1, state=0xd
```

// The peer port information carried in the packet was as follows:

- *length: 20*
- *system LACP priority: 0x0*
- *system MAC address: 00e0-fc02-0300*
- *port operation key: 0x1*
- *port LACP priority: 0x8000*
- *port number: 0x1*
- *current LACP state flag of the port: 0xd*

```
Collector: tlv=3, len=16, col-max-delay=0
```

// The content of the Collector field in the protocol packet was as follows:

- *length: 16*
- *maximum delay: 0*

```
Terminator: tlv=0, len=0
```

// The length of the Terminator field in the protocol packet is 0.

Other similar LACP protocol packet information is omitted here.

debugging lacp state

Syntax **debugging lacp state** [**interface** *interface-type interface-number* [**to** *interface-type interface-number*]] { { **actor-churn** | **mux** | **partner-churn** | **ptx** | **rx** } * | **all** }

undo debugging lacp state [**interface** *interface-type interface-number* [**to** *interface-type interface-number*]] { { **actor-churn** | **mux** | **partner-churn** | **ptx** | **rx** } * | **all** }

View User view

Default Level 1: Monitor level

Parameters *interface-type interface-number*: Port type and port number.

to: Specifies the ports with their port type and port number within the port range enclosed by the two *interface-type-interface-number* argument pairs around this keyword.

actor-churn: Debugging for Actor-churn state machine.

mux: Debugging for MUX state machine.

partner-churn: Debugging for Partner-churn state machine.

ptx: Debugging for PTX state machine.

rx: Debugging for RX state machine.

all: Debugging for all the state machines.

Description Use the **debugging lacp state** command to enable debugging for LACP protocol state machines on the specified port(s).

Use the **undo debugging lacp state** command to disable debugging for LACP protocol state machines on the specified port(s).

By default, debugging for LACP protocol state machines is disabled on a port.

If no port is specified, the command applies to all the ports running LACP.

Table 77 Description on the fields of the debugging lacp state command

Field	Description
from state XXX	The original state of a state transition
to state XXX	The final state of the state transition
stimulation	The event that triggers the state transition

Examples # Enable debugging for Rx state machine on Ethernet 2/1 to view the information about LACP Rx state transition.

```
<Sysname> debugging lacp state interface ethernet 1/2 rx
*0.1360830 Sysname LAGG/8/FSM:
 Port Ethernet1/2: FSM Rx  transfers from state RESERVE to state INITIALIZE
 by the stimulation Begin_True
```

// RX state machine was initiated and then transited to the INITIALIZE state. The event that triggered the transition was the startup of the state machine (Begin_True).

```
*0.1360830 Sysname LAGG/8/FSM:
Port Ethernet1/2: FSM Rx  transfers from state INITIALIZE to state PORT_DISABLED
 by the stimulation UCT
```

// RX state machine transited from the INITIALIZE state to the PORT_DISABLED state unconditionally (identified by UCT).

```
*0.1360830 Sysname LAGG/8/FSM:
Port Ethernet1/2: FSM Rx  transfers from state PORT_DISABLED to stat
e EXPIRED by the stimulation Lacp_Enabled
```

// RX state machine transited from the PORT_DISABLED state to the EXPIRED state. The event that triggered the transition was the enabling of LACP (Lacp_Enabled).

```
*0.1360862 Sysname LAGG/8/FSM:
 Port Ethernet1/2: FSM Rx  transfers from state EXPIRED to state CURRENT
 by the stimulation Pdu_Indicate
```

// RX state machine transited from the EXPIRED state to the CURRENT state (normal running state). The event that triggered the transition was the reception of the protocol packets from the peer (Pdu_Indicate).

debugging link-aggregation error

Syntax **debugging link-aggregation error**

undo debugging link-aggregation error

View User view

Default Level 1: Monitor level

Parameters None

Description Use the **debugging link-aggregation error** command to enable debugging for link aggregation errors.

Use the **undo debugging link-aggregation error** command to disable debugging for link aggregation errors.

By default, debugging for link aggregation errors is disabled.

Table 78 Description on the fields of debugging link-aggregation error command

Field	Description
File	The program file that incurs a running error
Line	The number of the line where the error occurs
ERROR	Error description

Examples # Enable debugging for link aggregation errors to view the error information prompted during the system running.

```
<Sysname> debugging link-aggregation error
*0.21953 Sysname LAGG/8/lacpErrorEvent:
 File e:v500d05sp1softwarelacplacp_agm.c, Line: 1200
 ERROR------  Portindex: 1   LACP_SendLACPPacket ,g_ucLacpSysMAC NULL !
```

// File e:v500d05sp1softwarelacplacp_agm.c has a running error, which occurs at line 1200. The ERROR field indicated that the system MAC address obtained is null.

debugging link-aggregation event

Syntax **debugging link-aggregation event**

undo debugging link-aggregation event

View User view

Default Level 1: Monitor level

Parameters None

Description Use the **debugging link-aggregation event** command to enable debugging for link aggregation events.

Use the **undo debugging link-aggregation event** command to disable debugging for link aggregation events.

By default, debugging for link aggregation events is disabled.

Table 79 Description on the fields of debugging link-aggregation event command

Field	Description
Agg Index	Aggregation group ID
Cfg MD5	MD5 digest
Restriction Value	Hardware restriction parameter
Admin Key	Administration key
Port Pri	Port LACP priority
Sys Mac	System MAC address
Sys Pri	System LACP priority
Oper Key	Port operation key

Examples # Enable debugging for link aggregation events to view the information about the events concerning link aggregation groups.

```
<Sysname> debugging link-aggregation event
<Sysname> display  link-aggregation summary

Aggregation Group Type: S -- Static , M -- Manual
Loadsharing Type: Shar -- Loadsharing, NonS -- Non-Loadsharing
Actor ID: 0x8000, 00e0-fc57-367f

  AL  AL   Partner ID          Select Unselect Share Master
  ID  Type                       Ports  Ports    Type  Port
--------------------------------------------------------------------------------
  10  M    none                  1      0        NonS  Ethernet1/1
```

// Aggregation group 10 existed. It contained Ethernet 1/1.

Remove aggregation group 10.

```
<Sysname> system-view
[Sysname] undo link-aggregation group 10
*0.91991886 Sysname LAGG/8/AggDel:Link Aggregation 10 is deleted.
```

// Aggregation group 10 was removed.

```
*0.91991961 Sysname LAGG/8/OperKeyDel:Oper key 1 is deleted.
```

// The operation key of port Ethernet 1/1 (Key 1) was removed.

```
*0.91992115 Sysname LAGG/8/AggDel:Slot=2;Link Aggregation 10 is dele
ted.
```

// Aggregation group 10 was removed on interface card 2.

29 MODEM CONFIGURATION COMMANDS

modem

Syntax **modem** [**both** | **call-in** | **call-out**]

undo modem [**both** | **call-in** | **call-out**]

View User interface view

Parameter **both**: Permits both modem call-in and modem call-out.

call-in: Permits only modem call-in.

call-out: Permits only modem call-out.

Description Use the **modem** command to enable modem call-in and call-out on the interface.

Use the **undo modem** command to disable modem call-in or call-out.

By default, both modem call-in and call-out are disabled on the interface.

Example # Enable receiving incoming Modem calls on User-interface 1.

```
<Sysname> system-view
[Sysname] user-interface tty 1
[Sysname-ui-tty1] modem call-in
```

modem auto-answer

Syntax **modem auto-answer**

undo modem auto-answer

View User interface view

Parameter None

Description Use the **modem auto-answer** command to have the external modem connected to the asynchronous interface automatically answer or hook off.

Use the **undo modem auto-answer** command to disable the connected external modem to answer automatically. In this case, the modem answers only when receiving an AT command sent by software.

By default, the connected external modem is set to non-auto answer mode.

Use this command depending on the answer state of the connected external modem. When the modem is in auto-answer mode (AA LED of the modem lights), configure the **modem auto-answer** command to prevent the router from sending an answer command after the modem answers automatically. If the modem is in non-auto answer mode, configure the **undo modem auto-answer** command.

If the configuration of this command is not consistent with the current answer state of the connected modem, anomalies may occur. You are not encouraged to configure this command.

Example # Set the answer mode of the modem connected to the asynchronous serial interface User-interface1 to auto.

```
<Sysname> system-view
[Sysname] user-interface tty 1
[Sysname-ui-tty1] modem auto-answer
```

modem timer answer

Syntax **modem timer answer** *time*

undo modem timer answer

View User interface view

Parameter *time:* Timeout time, in the range 1 to 60 seconds.

Description Use the **modem timer answer** command to set the interval from user hookoff to dial.

Use the **undo modem timer answer** command to restore the default.

By default, the valid interval is 30 seconds.

This command is only valid for AUX interface and other asynchronous interfaces.

Example # Set the valid interval from user hookoff to dial to 50 seconds.

```
<Sysname> system-view
[Sysname] user-interface aux 0
[Sysname-ui-aux0] modem timer answer 50
```

sendat

Syntax **sendat** *at-string*

View Interface view (The interface can be an asynchronous serial interface, a asynchronous/synchronous serial interface operating in the asynchronous mode, an AUX interface, or an AM interface.)

Parameter *at-string*: AT command string. This argument can contain "+++", "A/" or any string beginning with AT.

For detailed description of AT commands, see Table 80

Description Use the **sendat** command to send AT command to modem manually.

The **sendat** command sends strings to modem as AT commands without checking whether or not the strings are valid commands. The characters that are in lowercase in the string are converted to the corresponding uppercase characters automatically.

If debugging for modem is enabled on the interface, the result code returned by modem is displayed. If you specify to display the executed commands, The AT commands executed are displayed as well.

- *To accept AT commands from the modem, you must first put the modem in AT command mode. So sending commands in transmitting mode is invalid.*
- *The **sendat** command can issue only one AT command at a time.*
- *After Modem is configured with the AT command, its operating state might be changed, thus affecting the functions such as dialup. Please use this function with caution under the guidance of technicians.*

Table 80 Description on common AT commands

Command	Description
AT	Commands used to configure a modem, except A/ (Repeat Last Command) and +++ (Escape Code), begin with **AT**. **AT** informs the modem that commands are being sent to it. If you execute the AT command only, the modem returns OK or 0, which indicates that it is ready to accept commands.
A	Use **A** command to enable a modem to answer an incoming call without waiting for the ringing. You can use this command when you configure to answer an incoming call manually or the modem is configured to connect to another modem in actively. All the commands following the **A** command in the same command line are ignored.

Table 80 Description on common AT commands

Command	Description
Bn	Specifies the communication standard to be adopted and the transmission speed. The communication standard can be ITU or Bell. The n argument can be 0, 1, 2/3, 15, or 16.
	B0 specifies ITU V.22 and sets the transmission speed to 1,200 bps.
	B1 specifies Bell 212 and sets the transmission speed to 1,200 bps, which is a default setting.
	B2/B3 disables ITU V23 return path.
	B15 specifies ITU V21 and sets the transmission speed to 3,000 bps.
	B16 specifies 103J and sets the transmission speed to 300 bps, which is a default setting.
En	Sets the modem to echo commands to the workstation. The n argument can be o or 1.
	E0 disables echo of commands to the workstation.
	E1 enables echo of commands to the workstation, which is a default setting.
Dn	Dial Command enables the modem to dial the number following D in the command line. In the mode of pulse dialing, the modem ignores nonnumeric characters.
Hn	Hang up Control specifies the way to hang up a modem,
	H0 hangs up a modem, which is a default setting.
	H1 disconnects a modem through off hook.
In	Inquiries to display the modem product ID, ROM checksum or ROM checksum status. The n argument can be 0/3, 1, 2, 4, 5 or 9.
	I0/I3 displays the default speed and hardware version of controller in the modem.
	I1 calculates and displays ROM checksum.
	I2 checks ROM, calculates and checks checksum, and displays the information of OK or ERROR.
	I4 displays hardware version of data pump.
	I5 displays the ID, software version, hardware version and the country code of modem board.
	I9 displays the country code.
Ln	Specifies the speaker volume to low, medium and high. The n argument ranges from 0 to 3.
	L0/L1 sets the volume to be low.
	L2 sets the volume to be medium.
	L3 sets the volume to be high.
Mn	Monitors a speaker to be on or off when faxing and communicating. The n argument ranges from 0 to 3.
	M0 sets a speaker to be off.
	M1 sets a speaker to be on before carrier signal is detected, M1 is a default setting.
	M2 sets a speaker to be on when modem is disconnected.
	M3 sets a speaker to be on before carrier signal is detected except the span of dialing.

Table 80 Description on common AT commands

Command	Description
Nn	Specifies the local modem to perform negotiation connected with remote modem of different speed. The n argument is 0 or 1. **N0** adopts the communication standard specified by S37 register and ATB commands to perform digital switch during sending or receiving calling. **N1** adopts the transmission speed specified by S37 register and ATB commands to negotiate.
On	Forces a modem to be in the online mode. The n argument can be 0, 1 or 3. **O0** sets a modem to be in online mode. **O1** Initiates the balance and reorganizes the sequences before returns to the online mode. **O3** Negotiates the transmission speed before returns to the online mode. Note that this command causes a modem to operate in the online mode again after you switch to the command mode by executing the +++ (Escape Code) command,
Qn	Enables modem to send result codes. The n argument can be 0 or 1. **Q0** enables output result codes, which is a default setting. **Q1** disables output result codes.
Sr=n	Sets the value of a specified register to be n. You can use this command to modify the value of a specified register. You can specify the register to be set by specifying the r argument. The r argument is a number that can be one among 0 through 27, 29, 31 through 33, 35, 37, and 89. The n argument is the value assigned to the register, which ranges from 0 to 255.
T	Specifies to perform tone dialing (the default). This command can also be used as the dialing corrector.
P	Specifies to perform pulse dialing. After you execute this command, a modem performs pulse dialing until you execute the **T** command. This command can also be used as the dialing corrector.
Vn	Specifies format of result codes returned by modem. The n argument can be 0 or 1. **V0** sends result codes (numeric). **V1** sends result codes (text), which is a default setting.

Example # Send dialing command to call number 169.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] physical-mode async
[Sysname-Serial2/0] sendat ATD169
```

service modem-callback

Syntax **service modem-callback**

undo service modem-callback

View System view

Parameter None

Description Use the **service modem-callback** command to enable the callback function of modems.

Use the **undo service modem-callback** command to disable the callback function of modems.

By default, the callback function of modems is disabled.

When a modem line is active, that is, when the modem detects the carrier or data is being received, you may enable callback. As the **service modem-callback** command uses modem scripts to implement callback before entering PPP, it enables callback before accounting is started. This can thus help you save cost.

Example # Enable the callback function.

```
<Sysname> system-view
[Sysname] service modem-callback
```

30 PORT MIRRORING CONFIGURATION COMMANDS

display mirroring-group

Syntax **display mirroring-group** { *groupid* | **local** }

View Any view

Parameter *groupid*: Port mirroring group number. The value range is 1 to 5 for MSR 20 and BSR 30 series routers and 1 to 10 for MSR 50 series routers.

local: Specifies local port mirroring groups.

Description Use the **display mirroring-group** command to display the information about a port mirroring group.

The output information varies with port mirroring group type and is organized by mirroring group numbers.

Example # Display the information about all the port mirroring groups.

```
<Sysname> display mirroring-group local
mirroring-group 3:
type: local
status: active
mirroring port:
Ethernet1/1 inbound
    Ethernet1/2 both
monitor port : Ethernet1/3
```

Table 81 Description on the fields of the display mirroring-group command

Field	Description
mirroring-group	Port mirroring group number
type	Port mirroring group type
status	Status of a port mirroring group. "Active" for already effective, and "inactive" for not effective yet.
mirroring port	Source mirroring port
monitor port	Destination mirroring port

mirroring-group

Syntax **mirroring-group** *groupid* **local**

undo mirroring-group { *groupid* | **local** }

View System view

Parameter *groupid*: Port mirroring group number. The value range is 1 to 5 for MSR 20 and BSR 30 series routers and 1 to 10 for MSR 50 series routers.

local: Creates a local port mirroring group/removes all local port mirroring groups.

Description Use the **mirroring-group** command to create a port mirroring group.

Use the **undo mirroring-group** command to remove the specified port mirroring group or all local port mirroring groups.

Example # Create a local port mirroring group numbered 1.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
```

mirroring-group mirroring-port

Syntax **mirroring-group** *groupid* **mirroring-port** *mirroring-port-list* { **both** | **inbound** | **outbound** }

undo mirroring-group *groupid* **mirroring-port** *mirroring-port-list* { **both** | **inbound** | **outbound** }

View System view

Parameter *groupid*: Port mirroring group number. The value range is 1 to 5 for MSR 20 and BSR 30 series routers and 1 to 10 for MSR 50 series routers.

mirroring-port-list: List of ports to be added to the port mirroring group. You can specify multiple ports by providing this argument in the form of { *interface-type interface-number* [**to** *interface-type interface-number*] }&<1-8>, where the *interface-type* argument is port type, the *interface-number* argument is the port number, and &<1-8> means that you can provide up to eight port indexes/port index lists for this argument.

both: Specifies to mirror both inbound and outbound packets.

inbound: Specifies to mirror inbound packets only.

outbound: Specifies to mirror outbound packets only.

Description Use the **mirroring-group mirroring-port** command to add ports to a port mirroring group as source ports.

Use the **undo mirroring-group mirroring-port** command to remove source ports from a port mirroring group.

Note that:

- Layer 2 Ethernet ports, Layer 3 Ethernet interfaces, POS interfaces, and CPOS interfaces can all be source mirroring ports of local port mirroring groups.
- When you use the **undo mirroring-group mirroring-port** command to remove source ports from a port mirroring group, make sure the **both/inbound/outbound** keyword specified matches the actual packet direction of the ports.

Example # Add port Ethernet1/1 through Ethernet1/23 to port mirroring group 1 as source ports (assuming that port mirroring group 1 already exists).

```
<Sysname> system-view
[Sysname] mirroring-group 1 mirroring-port ethernet 1/1 to ethernet 1/23 both
```

[Sysname] mirroring-group 1 mirroring-port pos 5/1 to pos 5/4 both

[Sysname] mirroring-group 1 mirroring-port cpos 6/1 to cpos 6/4 both

Remove port Ethernet1/1 through Ethernet1/10 from port mirroring group 1.

```
[Sysname] undo mirroring-group 1 mirroring-port ethernet 1/1 to ethe
rnet 1/10 both
```

[Sysname] undo mirroring-group 1 mirroring-port pos 5/1 to pos 5/2 both

```
[Sysname] undo mirroring-group 1 mirroring-port cpos 6/1 to cpos 6/2 both
```

mirroring-group monitor-port

Syntax **mirroring-group** *groupid* **monitor-port** *monitor-port-id*

undo mirroring-group *groupid* **monitor-port** *monitor-port-id*

View System view

Parameter *groupid*: Port mirroring group number. The value range is 1 to 5 for MSR 20 and BSR 30 series routers and 1 to 10 for MSR 50 series routers.

monitor-port-id: Port index, in the form of *interface-type interface-number*.

Description Use the **mirroring-group monitor-port** command to add a port to a port mirroring group as the destination port.

Use the **undo mirroring-group monitor-port** command to remove the destination port from a port mirroring group.

Note that:

- A port mirroring group can contain only one destination port.
- Before add the destination port for a port mirroring group, make sure the port mirroring group exists.

- Layer 2 Ethernet ports, Layer 3 Ethernet interfaces, and tunnel interfaces can all be destination mirroring ports of local port mirroring groups.
- Member ports of an existing port mirroring group cannot be destination ports.

Example # Add port Ethernet1/1 to port mirroring group 1 (a remote destination port mirroring group) as the destination port.

```
<Sysname> system-view
[Sysname] mirroring-group 1 monitor-port ethernet 1/1
```

mirroring-port

Syntax **[mirroring-group** *groupid* **] mirroring-port { both | inbound | outbound }**

undo [mirroring-group *groupid* **] mirroring-port { both | inbound | outbound }**

View Interface view

Parameter *groupid*: Port mirroring group number. The value range is 1 to 5 for MSR 20 and BSR 30 series routers and 1 to 10 for MSR 50 series routers.

both: Mirrors both inbound and outbound packets.

inbound: Mirrors the inbound packets only.

outbound: Mirrors the outbound packets only.

Description Use the **mirroring-port** command to add the current port to a port mirroring group as a source mirroring port.

Use the **undo mirroring-port** command to remove the configuration.

Note that:

- If you do not specify the **mirroring-group** *groupid* keyword-argument combination, these two commands apply to port mirroring group 1.
- Depending on device models, you can add ports/interfaces to local port mirroring groups as source mirroring ports in Layer 2 Ethernet port view, Layer 3 Ethernet interface view, POS interface view, and CPOS interface view.
- When you use the **undo mirroring-port** command to remove the current port from a port mirroring group, make sure the **both/inbound/outbound** keyword specified matches the actual packet direction of the port.

Example # Add port Ethernet1/1 to port mirroring group 2, which already exists.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] mirroring-group 2 mirroring-port both
```

Add POS 5/1 to local port mirroring group 3.

```
<Sysname> system-view
[Sysname] mirroring-group 3 local
[Sysname] interface pos 5/1
[Sysname-Pos5/1] mirroring-group 3 mirroring-port both
```

Add CPOS 6/1 to local port mirroring group 4.

```
<Sysname> system-view
[Sysname] mirroring-group 4 local
[Sysname] controller cpos 6/1
[Sysname-Cpos6/1] mirroring-group 4 mirroring-port both
```

monitor-port

Syntax [**mirroring-group** *groupid*] **monitor-port**

undo [**mirroring-group** *groupid*] **monitor-port**

View Interface view

Parameter *groupid*: Port mirroring group number. The value range is 1 to 5 for MSR 20 and BSR 30 series routers and 1 to 10 for MSR 50 series routers.

Description Use the **monitor-port** command to add the current port to a port mirroring group as the destination mirroring port.

Use the **undo monitor-port** command to remove the configuration.

If you do not specify the **mirroring-group** *groupid* keyword-argument combination, the **monitor-port** command adds the current port to port mirroring group 1.

Note that:

- Depending on device models, you can add ports/interfaces to local port mirroring groups as destination mirroring ports in Layer 2 Ethernet port view, Layer 3 Ethernet interface view, and tunnel interface view.
- Member ports of an existing port mirroring group cannot be destination ports.

Example # Add port Ethernet 1/1 to port mirroring group 1 (a local port mirroring group) as the destination port.

```
<Sysname> system-view
[Sysname] mirroring-group 1 local
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] monitor-port
```

31 PPP AND MP CONFIGURATION COMMANDS

display interface mp-group

Syntax **display interface mp-group** [*mp-number*]

View Any view

Parameter *mp-number*: Multilink point to point protocol group (MP-group) interface number, which can be the number of any existing MP-group interface.

Description Use the **display interface mp-group** command to view the information about an existing MP-group interface. If the *mp-number* argument is not specified, the information about all existing MP-group interfaces is displayed.

Example # View the information about the interface MP-group 12.

```
<Sysname> display interface mp-group 12
Mp-group12 current state: DOWN
Line protocol current state: DOWN
Description: Mp-group12 Interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)
Internet protocol processing : disabled
Link layer protocol is PPP
LCP initial
Physical is MP
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards) 0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
Last 300 seconds input:  0 bytes/sec 0 packets/sec
Last 300 seconds output:  0 bytes/sec 0 packets/sec
     0 packets input, 0 bytes, 0 drops
     0 packets output, 0 bytes, 0 drops
```

Table 82 Description on the fields of the display interface mp-group command

Field	Description
current state	Physical state of the interface (up or down)
Line protocol current state	State of the data link layer protocol (up or down)
Description	Description string of the interface
The Maximum Transmit Unit	Maximum transmit unit (MTU) of the interface
Hold timer	Hold time of the link state (up/down) of the current interface
Internet protocol processing	State of the network layer protocol (enabled or disabled)

Table 82 Description on the fields of the display interface mp-group command

Field	Description
LCP initial	Link control protocol (LCP) negotiation is complete
Physical	Physical type of the interface
Last 300 seconds input: 0 bytes/sec 0 packets/sec	Average rate of input packets and output packets in the last 300 seconds (in bps)
Last 300 seconds output: 0 bytes/sec 0 packets/sec	
0 packets input, 0 bytes, 0 drops	Total amount of input packets of the interface (in the number of packets and in bytes respectively), and the number of dropped packets within the input packets
0 packets output, 0 bytes, 0 drops	Total amount of output packets of the interface (in the number of packets and in bytes respectively), and the number of dropped packets within these output packets

display interface virtual-template

Syntax **display interface virtual-template** [*number*]

View Any view

Parameter *number*: Virtual template (VT) number, which can be the number of any existing VT.

Description Use the **display interface virtual-template** command to view the information about a VT. If you do not provide the *number* argument, this command will display the information about all the existing VTs.

Related command: **interface virtual-template**.

Example # View the information about VT 1.

```
<Sysname> display interface virtual-template 1
Virtual-Template1 current state: UP
Line protocol current state: UP (spoofing)
Description: Virtual-Template1 Interface
The Maximum Transmit Unit is 1500
Internet protocol processing : disabled
Link layer protocol is PPP
LCP initial
Physical is None
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards) 0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
Last 300 seconds input:  0 bytes/sec 0 packets/sec
Last 300 seconds output:  0 bytes/sec 0 packets/sec
     0 packets input, 0 bytes, 0 drops
     0 packets output, 0 bytes, 0 drops
```

Refer to Table 82 for the description on the other fields.

display ppp mp

Syntax **display ppp mp** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display ppp mp** command to display information and statistics of MP interfaces.

Related command: **link-protocol ppp**, **ppp mp**.

Example # Display the information about MP interfaces configured through the MP-group.

```
<Sysname> display ppp mp
Mp-group is Mp-group0
max-bind: 20, min-fragment: 128 ,LFI max-delay: 100

 Bundle Multilink, 6 members, slot 0, Master link is Mp-group0
 Peer's endPoint descriptor: 1e9935f57c85
 Bundle Up Time: 2005/03/13  19:54:23:60
  0 lost fragments, 0 reordered, 0 unassigned, 0 interleaved,
 sequence 0/0 rcvd/sent
 The member channels bundled are:
      Serial1/1:15     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:16     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:17     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:18     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:19     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:20     Up-Time:2005/03/13  19:54:23:60
 Inactive member channels: 4 members
      Serial1/1:21     (inactive)
      Serial1/1:22     (inactive)
      Serial1/1:23     (inactive)
      Serial1/1:24     (inactive)
```

Table 83 Description on the fields of the display ppp mp command

Field	Description
Mp-group is Mp-group0	The MP-group interface is MP-group0.
max-bind	Maximum number of links in a MP bundle
min-fragment	Minimum size of an MP fragment
LFI max-delay	Maximum delay to transmit an LFI fragment
Bundle Multilink	Endpoint MP username is Multilink
6 member	Six channels are bound.
slot 0	The channels are bound on slot 0.
Master link is MP-group0	The master channel is MP-group0.
Peer's endPoint descriptor: 1e9935f57c85	The endpoint descriptor of the peer is 1e9935f57c85.
Bundle Up Time: 2005/03/13 19:54:23:60	The MP channel went up at 19:54:23:60 on March 13, 2005.
0 lost fragments	Number of the lost fragments

Table 83 Description on the fields of the display ppp mp command

Field	Description
0 reordered	Number of the packets reassembled
0 unassigned	Number of the packets waiting for being reassembled
0 interleaved	Number of the interleaved packets
sequence 0/0 rcvd/sent	Received sequence number/sent sequence number
The member channels bundled are	The following displays all the member channels bundled on this logical channel
Serial1/1:15 Up-Time:2005/03/13 19:54:23:60	Subchannel Serial1/1:15 is up at 19:54:23:60 on March 13, 2005
Inactive member channels	List of inactive subchannels

Display information about MP interfaces, which are configured via MP-groups.

```
<Sysname> display ppp mp
Mp-group is Mp-group0
max-bind: 20, min-fragment: 128 ,LFI max-delay: 100

 Bundle Multilink, slot 0, Master link is Mp-group0
 Peer's endPoint descriptor: 1e9935f57c85
 Bundle Up Time: 2005/03/13  19:54:23:60
  0 lost fragments, 0 reordered, 0 unassigned, 0 interleaved,
 sequence 0/0 rcvd/sent
 Member channels: 6 active, 4 inactive
      Serial1/1:15     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:16     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:17     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:18     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:19     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:20     Up-Time:2005/03/13  19:54:23:60
      Serial1/1:21     (inactive)
      Serial1/1:22     (inactive)
      Serial1/1:23     (inactive)
      Serial1/1:24     (inactive)
```

For description on the output fields, refer to Table 83.

display virtual-access

Syntax **display virtual-access** [*va-number* | **dialer** *dialer-number* | **peer** *peer-address* | **user** *user-name* | **vt** *vt-number*] *

View Any view

Parameter *va-number*: VA interface number, in the range 0 to 128.

dial *dialer-number*: Specifies a dialer interface number, which is in the range of 0 to 1023.

peer *peer-address*: Specifies the IP address of the peer of the VA interface, expressed in dotted decimal notation.

user *user-name*: Specifies a user name used for logging in through the VA interface. The *user-name* argument is a string of 1 to 80 characters.

vt *vt-number*: Specifies the number of the VT associated to the virtual access (VA) interface. The *user-name* argument ranges from 0 to 1023.

Description Use the **display virtual-access** command to view the information about specific VA interfaces.

VA interfaces are created automatically by the system, and they adopt the settings of specific VTs. A VA interface can be removed due to failures of lower layer connections or user intervention.

Example # Display the information about all the VA interfaces adopting the settings of VT 1.

```
<Sysname> display virtual-access vt 1
Virtual-Template1:0 current state :UP
Line protocol current state :UP
Description : Virtual-Template1:0 Interface
The Maximum Transmit Unit is 1500
Link layer protocol is PPP
LCP opened, MP opened, IPCP opened, OSICP opened
Physical is MP, baudrate: 64000
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards) 0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
Last 300 seconds input:  0 bytes/sec 0 packets/sec
Last 300 seconds output:  0 bytes/sec 0 packets/sec
     0 packets input, 0 bytes, 0 drops
     0 packets output, 0 bytes, 0 drops
```

Refer to Table 82 for the description on the fields of the **display interface virtual-access** command.

interface mp-group

Syntax **interface mp-group** *mp-number*

undo interface mp-group *mp-number*

View System view

Parameter *mp-number*: MP group interface number, ranging from 0 to 1023.

Description Use the **interface mp-group** command to create an MP group interface or enter MP group interface view.

Use the **undo interface mp-group** command to remove an MP-group interface.

This command need to be used in conjunction with the **ppp mp mp-group** command. You can execute the two commands regardless of the order in which they are executed.

Example # Create MP group 3 interface.

```
<Sysname> system-view
[Sysname] interface mp-group 3
[Sysname-Mp-group3]
```

interface virtual-template

Syntax **interface virtual-ethernet** *number*

undo interface virtual-ethernet *number*

View System view

Parameter *number*: VT number, ranging from 0 to 1023.

Description Use the **interface virtual-template** command to create a VT or enter VT view.

Use the **undo interface virtual-template** command to remove a VT.

To remove a VT, make sure that all the relevant VA interfaces are removed and the VT is not being used.

Example # Create VT 10 interface.

```
<Sysname> system-view
[Sysname] interface virtual-template 10
[Sysname-Virtual-Template10]
```

ip address ppp-negotiate

Syntax **ip address ppp-negotiate**

undo ip address ppp-negotiate

View Interface view

Parameter None

Description Use the **ip address ppp-negotiate** command to enable IP address negotiation on the local interface, so that the local interface can accept the IP address allocated by the remote end.

Use the **undo ip address ppp-negotiate** command to disable IP address negotiation.

By default, IP address negotiation is disabled.

Related command: **remote address**, **ppp ipcp remote-address forced**.

Example # Configure the IP address of interface Serial 1/0 to be negotiable.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ip address ppp-negotiate
```

link-protocol ppp

Syntax **link-protocol ppp**

View Interface view

Parameter None

Description Use the **link-protocol ppp** command to configure the link-layer protocol encapsulated on the interface as PPP.

By default, all interfaces except the Ethernet interface are encapsulated with PPP.

Example # Configure interface Serial 1/0 to encapsulate PPP.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] link-protocol ppp
```

ppp account-statistics enable

Syntax **ppp account-statistics enable**

undo ppp account-statistics enable

View Interface view

Parameters None

Description Use the **ppp account-statistics enable** command to enable the PPP accounting statistics function.

Use the **undo ppp account-statistics enable** command to disable the PPP accounting statistics function.

By default, the PPP accounting statistics function is disabled.

Examples # Enable the PPP accounting statistics function on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ppp account-statistics enable
```

ppp authentication-mode

Syntax **ppp authentication-mode** { **chap** | **pap** } [[**call-in**] **domain** *isp-name*]

undo ppp authentication-mode

View Interface view

Parameter **chap**, **pap**: Authentication modes. Use either mode.

call-in: Performs authentication only when receives a call from the remote end.

domain *isp-name*: Domain name during authentication, a string of 1 to 24 characters.

Description Use the **ppp authentication-mode** command to configure the PPP authentication mode used when the local device authenticates the peer.

Use the **undo ppp authentication-mode** command to disable authentication.

If you configure the **ppp authentication-mode** { **chap** | **pap** } command without specifying the **domain**, the default domain named system is used by default. Local authentication will be adopted and the address pool for address allocation must be the one you have configured for this domain.

If the **domain** is specified, you must configure an address pool in the specified domain.

If the username received includes a domain name, this domain name will be used for authentication (if the name does not exist, authentication is denied). Otherwise, the domain name configured for PPP authentication will be used.

If the username does not include a domain name, and the domain name configured for PPP authentication does not exist, authentication is denied.

By default, PPP authentication is not performed.

There are two types of PPP authentication: PAP and CHAP.

- PAP is a two-way handshake authentication, using plain text password.
- CHAP is a three-way handshake authentication, using ciphertext password.

In addition, you can also adopt the AAA authentication algorithm list (if defined) to perform authentication.

CHAP or PAP is just an authentication process. It is AAA that decides whether the authentication is successful or not. AAA uses a local authentication database or a AAA server to perform authentication.

For detailed description on how to create a local user and configure its attributes, and on how to create a domain and configure its attributes, refer to "local-user" on page 1940 and "domain" on page 1936.

For authentication on a dial-up interface, you are recommended to configure authentication on both the physical interface and the dialer interface. When the physical interface receives a DCC call request, it first initiates PPP negotiation and authenticates the dial-in user, and then passes the call to the upper layer protocol.

Related command: **local-user** on page 1940, **ppp chap user**, **ppp pap local-user**, ppp pap password, and **ppp chap password**.

Example # Authenticate the peer device by means of PAP on interface Serial 1/0.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp authentication-mode pap domain system
```

ppp chap password

Syntax **ppp chap password** { **cipher** | **simple** } *password*

undo ppp chap password

View Interface view

Parameter **cipher**: Indicates to display the password in ciphertext.

simple: Indicates to display the password in plain text.

password: Default CHAP password, a string of 1 to 16 characters. When the **simple** keyword is used, this password is in plain text. When the **cipher** keyword is used, this password can either be in ciphertext or in plain text. The plain text is a string of no more than 16 characters, like aabbcc. The ciphertext has a fixed length of 24 characters, like _(TT8F]Y5SQ=^Q‘MAF4<1!!.

Description Use the **ppp chap password** command to configure the password for CHAP authentication.

Use the **undo ppp chap password** command to cancel the configuration.

Related command: **ppp authentication-mode chap**.

Example # Set the username to Sysname, which is to be displayed in plain text in CHAP authentication.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp chap password simple sysname
```

ppp chap user

Syntax **ppp chap user** *username*

undo ppp chap user

View Interface view

Parameter *username:* Username of CHAP authentication, a string of 1 to 80 characters, which is the one sent to the peer device to be authenticated.

Description Use the **ppp chap user** command to configure the user name when performing CHAP authentication.

Use the **undo ppp chap user** command to delete the existing configuration.

By default, the user name of the CHAP authentication is blank.

While configuring CHAP authentication, you should configure the *username* of both ends as the *local-user* of its peer, and configure the *password* accordingly.

Related command: **ppp authentication-mode**.

Example # On interface Serial 1/0, configure the local username as Root when performing CHAP authentication

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp chap user Root
```

ppp ipcp dns

Syntax **ppp ipcp dns** *primary-dns-address* [*secondary-dns-address*]

undo ppp ipcp dns *primary-dns-address* [*secondary-dns-address*]

View Interface view

Parameter *primary-dns-address*: IP address of the primary DNS server.

secondary-dns-address: IP address of the secondary DNS server.

Description Use the **ppp ipcp dns** command to set the device to allocate DNS server address for the peer.

Use the **undo ppp ipcp dns** command to disable the device to allocate DNS server address for the peer.

By default, the device does not allocate DNS server addresses for its peer.

When connected using PPP, a device can assign a DNS server address to its peer after negotiation (usually based on the request of the peer), allowing the peer to access the network directly using domain name.

If a PC is connected to the device using PPP, you can use the **winipcfg** command or the **ipconfig/all** command to view its DNS server address assigned by the device.

A sysname device can provide a primary DNS server address and a secondary DNS server address.

Example # Configure the local device to assign primary DNS server address 100.1.1.1, and secondary DNS server address 100.1.1.2 to its peer.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp ipcp dns 100.1.1.1 100.1.1.2
```

ppp ipcp dns admit-any

Syntax **ppp ipcp dns admit-any**

undo ppp ipcp dns admit-any

View Interface view

Parameter None

Description Use the **ppp ipcp dns admit-any** command to configure the device to passively accept the DNS server address assigned by the peer, even without sending a DNS request.

Use the **undo ppp ipcp dns admit-any** command to disable this function.

By default, a device does not passively accept DNS server address assigned by the peer.

When a device is connected to another device (for example, a network access server of a service provider) using PPP, the device can be configured to accept the DNS server address allocated by the peer to resolute the domain name.

Example # Set the interface Serial 1/0 of the local device to accept DNS server address allocated by the peer.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp ipcp dns admit-any
```

ppp ipcp dns request

Syntax **ppp ipcp dns request**

undo ppp ipcp dns request

View Interface view

Parameter None

Description Use the **ppp ipcp dns request** command to enable a device to request its peer for the DNS server address actively through a port.

Use the **undo ppp ipcp dns request** command to restore the default.

By default, a device does not request its peer for the DNS server address actively.

You can configure a device to request its peer (especially in cases where a device is connected to the operator's access server through a dialup link) for the DNS server address during PPP negotiation, after which domain names can be resolved on the device.

You can check the DNS server address of a port by displaying the information about the port.

Example # Enable the device to request its peer for the DNS server address actively through Serial 2/0 interface.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ppp ipcp dns request
```

ppp ipcp remote-address forced

Syntax **ppp ipcp remote-address forced**

undo ppp ipcp remote-address forced

View Interface view

Parameter None

Description Use the **ppp ipcp remote-address forced** command to forbid the peer to use self-configured IP address, but have to use the one allocated by the local device.

Use the **undo ppp ipcp remote-address forced** command to cancel this feature.

By default, the peer can use its self-configured IP address in PPP IPCP negotiation. The peer can request the local device for an address or use a fixed IP address configured by itself

If you do not want the peer to use self-configured IP address, you must configure the **ppp ipcp remote-address forced** command on the local interface.

Related command: **remote address**.

Example # Configure the interface serial 1/0 to allocate the IP address 10.0.0.1 to the peer. The peer may accept this assigned address, or use its self-configured address, or have no IP address.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] remote address 10.0.0.1
```

Configure the interface serial 1/0 to allocate the IP address 10.0.0.1 to the peer. The peer must accept this allocated address and cannot use its self-configured address or go without IP address.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] remote address 10.0.0.1
[Sysname-Serial1/0] ppp ipcp remote-address forced
```

ppp lqc

Syntax **ppp lqc** *close-percentage* [*resume-percentage*]

undo ppp lqc

View Interface view

Parameter *close-percentage*: If the link quality decreases below this percentage, the link will go down. The value ranges from 0 to 100.

resume-percentage: If the link quality recovers above this percentage, the link will go up. The value ranges from 0 to 100.

Description Use the **ppp lqc** command to enable PPP link quality control (LQC).

Use the **undo ppp lqc** command to disable PPP link quality control.

By default, PPP LQC is disabled.

By default, the arguments *resume-percentage* and *close-percentage* are equal. But in actual configuration, the *resume-percentage* must not be smaller than *close-percentage*.

PPP LQC functions to monitor the quality of PPP links, including those in MP bundles. A link goes down when its quality drops below the close percentage and goes up when its quality exceeds the resume-percentage. To avoid flapping, a link experiences a delay before it is reused.

Before you enable PPP LQC, the PPP interface sends keepalives to the peer every some time. After you enable LQC on the interface, it sends link quality reports (LQRs) instead of keepalives to monitor the link.

When link quality is normal, the system calculates link quality based on each LQR and disables the link if the results of two consecutive calculations are below the close-percentage. Once the link is disabled, the system starts to calculate link

quality every ten LQRs, and brings the link up if the results of three consecutive calculations are higher than the resume-percentage. This means a disabled link must experience 30 keepalive periods before it can go up again. If a large keepalive period is specified, it may take long time for the link to go up.

When enabling LQC at both ends of a PPP link, you must set the same parameters on the devices involved. Normally, it is not recommended to enable LQC at both ends of a link. In addition, LQC on dial-up line is not recommended too. This is because that when a link on dial-up line is disabled, the DCC would disconnect the dial-up line, causing LQC not to work. It is not until there are data to transmit, will DDC brings the dial-up line up again and LQC resumes to work.

Example # Enable LQC on interface Serial 1/0, setting close-percentage to 90 and resume-percentage to 95.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp lqc 90 95
```

ppp mp

Syntax **ppp mp**

undo ppp mp

View Interface view

Parameter None

Description Use the **ppp mp** command to enable MP on the interface encapsulated with PPP.

Use the **undo ppp mp** command to disable this feature.

By default, the interface encapsulated with PPP operates in the Single PPP mode.

To increase bandwidth, multiple PPP links can be bound to form a logical MP interface.

Example # Configure the PPP encapsulated interface Serial 1/0 to work in MP mode.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp mp
```

ppp mp binding-mode

Syntax **ppp mp binding-mode** { **authentication** | **both** | **descriptor** }

undo ppp mp binding-mode

View Virtual template interface view, dialer interface view

Parameter **authentication**: Performs MP binding according to PPP authentication username.

both: Performs MP binding according to both the PPP authentication username and the endpoint descriptor.

descriptor: Performs the MP binding according to the endpoint descriptor.

Description Use the **ppp mp binding-mode** command to set the MP binding mode.

Use the **undo ppp mp binding-mode** command to restore the default MP binding mode.

By default, MP binding is based on both the PPP authentication username and the endpoint descriptor.

The username is the peer's username received while performing PAP or CHAP authentication. The endpoint descriptor, which uniquely specifies a device, refers to the peer's endpoint descriptor received when performing LCP negotiation. Based on the username or endpoint descriptor, the system can locate the specified VT interface and create a MP binding according to the configuration on the template.

Note that:

- When MP binding is only based on descriptors, users cannot be differentiated. So, to bind users to different groups, use the keyword **both** in the command.
- When MP binding is only based on authentication usernames, peer devices cannot be differentiated. So, when multiple peer devices exist, use the keyword **both** in the command.

Related command: **ppp mp user**.

Example # Perform MP binding based on PPP authentication username.

```
<Sysname> system-view
[Sysname] interface dialer 0
[Sysname-Dialer0] ppp mp binding-mode authentication
```

ppp mp max-bind

Syntax **ppp mp max-bind** *max-bind-num*

undo ppp mp max-bind

View Virtual template interface view, dialer interface view

Parameter *max-bind-num*: Specifies the maximum number of links which can be bound, in the range 1 to 128.

Description Use the **ppp mp max-bind** command to configure the maximum number of links allowed in an MP bundle.

Use the **undo ppp mp max-bind** command to restore the default value, which is 16.

Generally speaking, it is unnecessary to configure this argument, but in case you need to configure it, you must do it under the guidance of technical engineers. Such a configuration may affect the performance of PPP.

- *If MP fails to delete links, it is possibly because that the maximum number of bundled links is smaller than what has actually been configured. Make sure that the maximum binding number is larger than the actual one.*
- *After you change the maximum number of bundled links in an MP on a virtual-template or dialer interface, you must **shutdown** and then **undo shutdown** the relevant physical interfaces before modification takes effect.*

Related command: **ppp mp**.

Example # Set the maximum number of binding links to 12.

```
<Sysname> system-view
[Sysname] interface virtual-template 0
[Sysname-Virtual-Template0] ppp mp max-bind 12
```

ppp mp min-bind

Syntax **ppp mp min-bind** *min-bind-num*

undo ppp mp min-bind

View Dialer interface view

Parameter *min-bind-num*: Specifies the minimum number of links in an MP bundle, in the range 1 to 128.

Description Use the **ppp mp min-bind** command to configure the minimum number of PPP links that an MP bundle should contain.

Use the **undo ppp mp min-bind** command to restore the default value.

By default, the minimum number of PPP links in an MP bundle is 0, which means that MP dial-up relies on traffic detection.

In dial-up application, you sometimes need multiple links to bear services simultaneously to guarantee the minimum bandwidth in transmitting a packet. In this case, you can use this command to set the minimum links to be bound.

Note that, after you configure the **ppp mp min-bind** command, MP dial-up no longer depends on traffic detection. Moreover, links that have been established will not be removed even in case of timeout. This means that after the **ppp mp**

min-bind command is configured, the **dialer timer idle** command no longer takes effect.

The argument *min-bind-num* must be no greater than *max-bind-num*.

Related command: **dialer threshold** on page 324

Example # Set the minimum number of links contained in an MP bundle to 4.

```
<Sysname> system-view
[Sysname] interface dialer 0
[Sysname-dialer0] ppp mp min-bind 4
```

ppp mp min-fragment

Syntax **ppp mp min-fragment** *size*

undo ppp mp min-fragment

View Virtual template interface view, dialer interface view, MP-group interface view

Parameter *size*: Specifies the minimum MP outgoing packet size to be fragmented, in bytes. The value ranges from 128 to 1500. If the MP outgoing packet is smaller than this value, it will not be fragmented. If the MP packet is larger than or equal to this value, it will be fragmented.

Description Use the **ppp mp min-fragment** command to set the minimum size of MP outgoing packet to be fragmented.

Use the **undo ppp mp min-fragment** command to restore the default, that is, 128 bytes.

If you do not want small packets to be fragmented, you can specify the *size* argument to an appropriate value.

- *If MP bundle is implemented through hardware (CPOS chip for example), the minimum fragment size varies with chips (for example, the fragment size on certain chips can only be 128, 256, and 512 bytes). In this case, you need to make sure the setting specified by the **ppp mp min-fragment** command conforms to the hardware specification for the MP bundle and the sub-channel LCP link to be established successfully.*
- *After executing the **ppp mp min-fragment** command, you need to shut down and then bring up all the bundled ports for the new setting to take effect.*

Example # Set the minimum MP packet size for fragmentation to 500 bytes.

```
<Sysname> system-view
[Sysname] interface virtual-template 0
[Sysname-Virtual-Template0] ppp mp min-fragment 500
```

ppp mp mp-group

Syntax **ppp mp mp-group** *number*

undo ppp mp

View Interface view

Parameter *number*: MP-group interface number, in the range 0 to 1023.

Description Use the **ppp mp mp-group** command to add the current interface to the specified MP-group.

Use the **undo ppp mp mp-group** command to remove the current interface from the specified MP-group.

This command should be used along with the **interface mp-group** command. With the two commands, you can create an MP-group interface first and then add an interface to the MP-group. It does not matter if you reverse the two steps.

Note that only physical interfaces can be added to an MP group. Logical interfaces such as Tunnel interfaces do not support this command.

Example # Add interface Serial 3/0 to MP-group 3.

```
<Sysname> system-view
[Sysname] interface serial 3/0
[Sysname-Serial3/0] ppp mp mp-group 3
```

ppp mp user

Syntax **ppp mp user** *username* **bind virtual-template** *number*

undo ppp mp user *username*

View System view

Parameter *username:* User name, a string of 1 to 80 characters.

virtual-template *number*: Specifies a virtual-template. The *number* argument is in the range of 0 to 1023.

Description Use the **ppp mp user** command to bind an MP user to a virtual template.

Use the **undo ppp mp user** command to remove the specified binding.

In establishing a PPP connection, after PPP authentication succeeds, if a virtual-template is specified, MP will be bound based on the parameters of the virtual-template and a new virtual interface will be formed to transfer data.

You can configure the following parameters on the virtual-template:

- Local IP address and the IP address (or IP address pool) assigned to the peer
- PPP working parameter

Related command: **ppp mp** and **ppp mp max-bind**.

Example # Specify the VT interface that corresponds to user 1 as 1, and configure the IP address of the VT as 202.38.60.1.

```
<Sysname> system-view
[Sysname] ppp mp user user1 bind virtual-template 1
[Sysname] interface virtual-template 1
[Sysname-Virtual-Template1] ip address 202.38.60.1 255.255.255.0
```

ppp mp virtual-template

Syntax **ppp mp virtual-template** *number*

undo ppp mp

View Interface view

Parameter *number:* Specifies the VT interface number to be bound on the interface, in the range 0 to 1023.

Description Use the **ppp mp virtual-template** command to configure the VT interface number to be bound on the interface, enabling the interface to work in MP mode.

Use the **undo ppp mp** command to remove MP binding of the interface, making the interface to work in PPP mode.

By default, MP binding on the interface is disabled, and the interface works in PPP mode.

This command specifies the VT interface number to be bound on the interface. In configuring MP binding on the interface configured with this command, you needs not configure PAP or CHAP authentication.

Two or more interfaces with the same virtual template number is bound directly together. Moreover, once you used this command on an interface, you cannot use the **ppp mp** command on the same interface, and vice versa.

Example # Configure interface serial 1/0 encapsulated with PPP to work in MP mode, with the VT interface being Virtual-Template1

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp mp virtual-template 1
```

ppp pap local-user

Syntax **ppp pap local-user** *username* **password** { **cipher** | **simple** } *password*

undo ppp pap local-user

View Interface view

Parameter *username*: Specifies the username sent by the local device when it is authenticated by the peer device via PAP, a string of 1 to 80 characters.

cipher: Displays the password in ciphertext.

simple: Displays the password in plain text.

password: Specifies the password sent by the local device when it is authenticated by the peer device using PAP, a string of 1 to 16 characters. When the **simple** keyword is used, this password is in plain text. When the **cipher** keyword is used, this password can be either in ciphertext or plain text. The plain text is a string of no more than 16 characters, like aabbcc. The ciphertext has a fixed length of 24 characters, like _(TT8F]Y5SQ=^Q‘MAF4<1!!.

Description Use the **ppp pap local-user** command to configure the username and password sent by the local device when it is authenticated by the peer device via the PAP method.

Use the **undo ppp pap local-user** command to disable the configuration.

By default, both the username and the password are empty.

When the local router is authenticated via the PAP method by the peer device, the *username* and *password* sent by the local device must be the same as the *username* and *password* of the peer router.

Related command: **local-user** on page 1940, **password** on page 1941

Example # Set the username of the local device authenticated by the peer via PAP as user1 and the password as pass1.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp pap local-user user1 password simple pass1
```

ppp timer negotiate

Syntax **ppp timer negotiate** *seconds*

undo ppp timer negotiate

View Interface view

Parameter *seconds:* Period of negotiation timeout in seconds. In PPP negotiation, if the local device fails to receive a response from the peer during this period of time, PPP will resend the last packet. This period ranges from 1 to 10 seconds.

Description Use the **ppp timer negotiate** command to set the PPP negotiation timeout interval.

Use the **undo ppp timer negotiate** command to restore the default value.

By default, the PPP negotiation timeout interval is three seconds.

Example # Set the PPP negotiation timeout interval to five seconds.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp timer negotiate 5
```

remote address

Syntax **remote address** { *ip-address* | **pool** [*pool-number*] }

undo remote address

View Interface view

Parameter *ip-address*: Indicates the IP address assigned to the peer.

pool [*pool-number*]: Specifies an address pool identified by the *pool-number* argument. An IP address from this address pool will be assigned to the peer. The *pool-number* argument ranges from 0 to 99 and defaults to 0.

Description Use the **remote address** command to allocate IP address for the peer device.

Use **undo remote address** to remove the IP address allocated for the peer device.

By default, an interface does not allocate IP address for the peer device. If the *pool-numbe*r argument is not specified while using this command, the global address pool 0 will be used by default.

This command can be used in situation when the local device is configured with an IP address, while the peer has no IP address. To accomplish the configuration, you need to configure the **ip address ppp-negotiate** command on the peer device, and configure the **remote address** command on the local device, so that the peer device can accept IP address allocated to it through PPP negotiation.

CAUTION: *This command allows the peer device to configure its IP address by itself even if it has received an IP address allocated by the local device. If you do not want this to happen, you must configure the* ***ppp ipcp remote-address forced*** *command to forbid the peer device to configure its own IP address.*

Related command: **ip address ppp-negotiate**, **ppp ipcp remote-address forced**

Example # Configure Interface Serial 1/0 to allocate IP address 10.0.0.1 to its peer device.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] remote address 10.0.0.1
```

timer hold

Syntax **timer hold** *seconds*

undo timer hold

View Interface view

Parameter *seconds:* Time interval for the interface to send keepalive packet in seconds. The value ranges from 0 to 32767 and defaults to 10. If the value is set to 0, keepalive packet will not be sent.

Description Use the **timer hold** command to set the timer to send keepalive packet.

Use the **undo timer hold** command to restore the default value, or 10 seconds.

If the timer is set to 0 seconds, this means keepalive packets will not be sent out.

On slow links, the *seconds* argument must not be too small. As a slow link takes long to transmit large packets, this may cause the sending and receiving of keepalive packet to be postponed. If an interface does not receive keepalive packet from the peer device for many keepalive periods, it regards the link to be bad. If this period exceeds the value specified by the *seconds* argument, the link will be shut down.

When the interfaces are configured with PPP, the same keepalive interval should be configured on both sides of the link.

Example # Set the period to send keepalive packet on interface Serial 1/0 to 20 seconds.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] timer hold 20
```

32 PPP LINK EFFICIENCY MECHANISM CONFIGURATION COMMANDS

display ppp compression iphc rtp

Syntax **display ppp compression iphc rtp** [*interface-type interface-number*]

View Any view

Parameter *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display ppp compression iphc rtp** command to view statistics about IPHC RTP header compression.

Note that:

- When IPHC RTP header compression is applied on an MP link, the compression is performed on the VA (virtual access) interfaces. In this case, you can check the compression information on MP templates, such as VT or Dialer.
- When IPHC RTP header compression is applied on a normal PPP link, the compression is performed on the physical link. In this case, you can check the compression information on the physical interfaces only.

Example # Display statistics about IPHC RTP header compression.

```
<Sysname> display ppp compression iphc rtp
```

display ppp compression iphc tcp

Syntax **display ppp compression iphc tcp** [*interface-type interface-number*]

View Any view

Parameter *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display ppp compression iphc tcp** command to display statistics about IPHC TCP header compression.

Note that:

- When IPHC TCP header compression is applied on an MP link, the compression is performed on the VA (virtual access) interfaces. In this case, you can check the compression information on MP templates, such as VT or Dialer.
- When IPHC TCP header compression is applied on a normal PPP link, the compression is performed on the physical link. In this case, you can check the compression information on the physical interfaces only.

Example # Display statistics about IPHC TCP header compression.

```
<Sysname> display ppp compression iphc tcp
```

display ppp compression stac-lzs

Syntax **display ppp compression stac-lzs** [*interface-type interface-number*]

View Any view

Parameter *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display ppp compression stac-lzs** command to view statistics about STAC-LZS compression.

Note that:

- When STAC-LZS header compression is applied on an MP link, the compression is performed on the VA (virtual access) interfaces. In this case, you can check the compression information on MP templates, such as VT or Dialer.
- When STAC-LZS compression is applied on a normal PPP link, the compression is performed on the physical link. In this case, you can check the compression information on the physical interfaces only.

Example # Display information about STAC-LZS compression.

```
<Sysname> display ppp compression stac-lzs
Staz-lzs compression
  Interface: Serial1/1:0
    Received:
      Compress/Error/Discard/Total: 302/0/0/302 (Packets)
    Sent:
      Compress/Error/Total: 302/0/302 (Packets)
```

ip tcp vjcompress

Syntax **ip tcp vjcompress**

undo ip tcp vjcompress

View Interface view

Parameter None

Description Use the **ip tcp vjcompress** command to enable a PPP interface to compress the VJ TCP header.

Use the **undo ip tcp vjcompress** command to disable the PPP interface to compress the VJ TCP header.

By default, the VJ TCP header compression is disabled on PPP interfaces.

If a PPP interface is enabled to perform VJ TCP header compression, so should the interface at the opposite end.

Example # Enable VJ TCP header compression on interface Serial 1/0.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ip tcp vjcompress
```

ppp compression iphc

Syntax **ppp compression iphc** [**nonstandard**]

undo ppp compression iphc

View Interface view

Parameter **nonstandard**: Nonstandard encapsulation mode.

Description Use the **ppp compression iphc** command to enable IP header (TCP header and RTP header mainly) compression on the interface.

Use the **undo ppp compression iphc** command to disable IP header compression.

By default, TCP header compression and RTP header compression are disabled.

Once IP header compression is enabled, the header compression for TCP packets used to establish RTP sessions is also enabled. When IP header compression is disabled, the header compression for TCP packets used to establish RTP sessions is also disabled.

To enable IP header compression, you need to execute the **ppp compression iphc** command on both ends of the link.

Note that:

- If the configuration is applied on VT and Dialer interfaces, ISDN and asynchronous dialer interfaces, the configuration takes effect only after you shutdown and then bring up the interfaces.

- If the configuration is applied on a MP bundle, you need to shut down and then bring up all the member interfaces of the MP bundle for the configuration to take effect.

Related command: **ppp compression iphc rtp-connections**, **ppp compression iphc tcp-connections**.

Example # Enable IP header compression on interface Serial 1/0.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp compression iphc
```

ppp compression iphc rtp-connections

Syntax **ppp compression iphc rtp-connections** *number*

undo ppp compression iphc rtp-connections

View Interface view

Parameter *number*: The maximum connection number of RTP header compression. The value ranges from 3 to 1000.

Description Use the **ppp compression iphc rtp-connections** command to specify the maximum number of RTP header compression connections allowed on an interface.

Use the **undo ppp compression iphc rtp-connections** command to restore the default value, which is 16.

RTP is connection oriented; the number of RTP connections that a link can accommodate is relatively large. The compression algorithm, however, requires the device to maintain some information for each connection when compressing headers. To restrict the memory load generated by compression, you can use the **ppp compression iphc rtp-connections** command to limit the number of compression. For example, if you limit RTP connections to three, the packets on the fourth RTP connection will not be compressed.

The configuration takes effect after you execute the command **shutdown** and then **undo shutdown** on the interface. If you are configuring MP, you must execute the commands **shutdown** and **undo shutdown** on all MP member interfaces.

Example # Set the number of compression-enabled RTP header connections to 10 on interface Serial 1/0.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp compression iphc rtp-connections 10
```

ppp compression iphc tcp-connections

Syntax **ppp compression iphc tcp-connections** *number*

undo ppp compression iphc tcp-connections

View Interface view

Parameter *number*: The maximum connection number of TCP header compression. The value ranges from 3 to 256.

Description Use the **ppp compression iphc tcp-connections** command to configure the maximum number of connections in TCP header compression.

Use the **undo ppp compression iphc tcp-connections** command to restore the default value, which is 16.

TCP is connection oriented; the number of TCP connections that a link can accommodate is relatively large. The use of compression however requires the router to maintain some information for each connection when compressing headers. To restrict the memory load generated by compression, you can use the **ppp compression iphc tcp-connections** command to limit the number of compression-enabled TCP connections to three for example. The packets on the fourth TCP connection are not compressed as a result.

The configuration takes effect only after you perform the **shutdown** and then the **undo shutdown** operations on the interface. If the configuration is for an MP bundle, you should perform the operations on all MP member interfaces.

Example # Set the number of compression-enabled TCP connections to 10 on interface Serial 1/0.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] ppp compression iphc tcp-connections 10
```

ppp compression stac-lzs

Syntax **ppp compression stac-lzs**

undo ppp compression stac-lzs

View Interface view

Parameter None

Description Use the **ppp compression stac-lzs** command to enable STAC-LZS compression for PPP.

Use the **undo ppp compression stac-lzs** command to disable STAC-LZS compression on the current interface.

By default, this compression is disabled.

STAC-LZS compression is supported on the current version of system. You can configure STAC-LZS compression on an interface to reduce size of data frames through lossless compression. However, as this can increase the load on the device, you are recommended to disable the function when the device is heavily loaded.

Note that STAC-LZS compression takes effect on a PPP link only when the **stac-lzs** option is configured on both ends of the link. Currently, outbound expedite forwarding is not applicable on links with Stac-LZS compression enabled. So, it is recommended that you disable outbound fast forwarding before execute the **ppp compression stac-lzs** command.

Note that:

- If the configuration is applied on VT and Dialer interfaces, ISDN and asynchronous dialer interfaces, the configuration takes effect only after you shut down and then bring up the interfaces.
- If the configuration is applied on a MP bundle, you need to shut down and then bring up all the member interfaces of the MP bundle for the configuration to take effect.

Example # Enable STAC-LZS compression on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ppp compression stac-lzs
```

ppp mp lfi

Syntax **ppp mp lfi**

undo ppp mp lfi

View Virtual template interface view, MP-group interface view, dialer interface view

Parameter None

Description Use the **ppp mp lfi** command to enable link fragmentation and interleaving (LFI) on the interface.

Use the **undo ppp mp lfi** command to disable the function.

By default, LFI is disabled.

Example # Enable LFI on Virtual-Template1.

```
<Sysname> system-view
[Sysname] interface virtual-template 1
[Sysname-Virtual-Template1] ppp mp lfi
```

ppp mp lfi delay-per-frag

Syntax **ppp mp lfi delay-per-frag** *time*

undo ppp mp lfi delay-per-frag

View Virtual template interface view, MP-group interface view, dialer interface view

Parameter *time*: Maximum time delay of LFI fragment in ms, in the range 1 to 1000.

Description Use the **ppp mp lfi delay-per-frag** command to set the maximum time delay for transmitting a LFI fragment.

Use the **undo ppp mp lfi delay-per-frag** command to restore the default value, or 10 ms.

Example # Set the maximum time delay of LFI fragment of Virtual-Template1 to 20 ms.

```
<Sysname> system-view
[Sysname] interface virtual-template 1
[Sysname-Virtual-Template1] ppp mp lfi delay-per-frag 20
```

reset ppp compression iphc

Syntax **reset ppp compression iphc** [*interface-type interface-number*]

View User view

Parameter *Interface-type Interface-number:* Specifies an Interface by its type and number.

Description Use the **reset ppp compression iphc** command to delete IP header compression statistics.

If the *interface-type* and *interface-number* arguments are not specified, the IP header compression statistics on all interfaces will be cleared.

Example # Reset statistics about IP header compression on all interfaces.

```
<Sysname> reset ppp compression iphc
```

33 PPPoE Server Configuration Commands

display pppoe-server session

Syntax **display pppoe-server session { all | packet }**

View Any view

Parameter **all**: Displays all information about each PPPoE session.

packet: Displays statistics about the packets on each PPPoE session.

Description Use the **display pppoe-server session** command to view the status and statistics of PPPoE session.

*The support for the **display pppoe-server session packet** command varies with device models.*

Example # View all the session information of PPPoE.

```
<Sysname> display pppoe-server session all
SID Intf                 State  OIntf          RemMAC          LocMAC
2   Virtual-Template1:0  UP  Ethernet1/0  0050.ba22.7369  00e0.fc08.f4de
```

Table 84 Description on the fields of the display pppoe-server session all command

Field	Description
SID	PPPoE session identifier
Intf	The corresponding Virtual-Template interface
State	State PPPoE of sessions
OIntf	corresponding Ethernet interface
RemMAC	Remote MAC address
LocMAC	Local MAC address

View the statistics of PPPoE session.

```
Sysname> display pppoe-server session packet
SID   RemMAC    LocMAC        InP     InO   InD     OutP     OutO  OutD
1  0050ba1a02ce 0001af02a40f  42      2980  0       16       343   0
```

Table 85 Description on the fields of the display pppoe-server session packet command

Field	Description
SID	PPPoE session identifier
RemMAC	Remote MAC address
LocMAC	Local MAC address

Table 85 Description on the fields of the display pppoe-server session packet command

Field	Description
InP	In Packets, Packages received
InO	In Octets, Bytes received
InD	In Discards, Received and then discarded packages
OutP	Out Packets, Packages sent
OutO	Out Octets, Bytes sent
OutD	Out Discard, Discarded packages that might be sent

pppoe-server bind

Syntax **pppoe-server bind virtual-template** *number*

undo pppoe-server bind

View Interface view

Parameter *number*: Number of the virtual-template interface, in the range 0 to 1023.

Description Use the **pppoe-server bind** command to enable PPPoE on the virtual-template specified by the Ethernet interface.

Use the **undo pppoe-server bind** command to disable PPPoE protocol on the relevant interface.

By default, PPPoE protocol is disabled.

Example # Enable PPPoE on interface Ethernet 1/0, and bind Virtual-Template1 with interface Ethernet 1/0

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] pppoe-server bind virtual-template 1
```

pppoe-server log-information off

Syntax **pppoe-server log-information off**

undo pppoe-server log-information off

View System view

Parameter None

Description Use the **pppoe-server log-information off** command to disable the PPPoE server to display the PPP log information.

Use the **undo pppoe-server log-information off** command to enable the function.

By default, the PPPoE server displays the PPP log information.

Displaying too much log information can affect the performance of the device and can be a nuisance to user during configuration. You can use this command to disable the PPPoE server to display the PPP log information.

Example # Disable the PPPoE server to display PPP log information.

```
<Sysname> system-view
[Sysname] pppoe-server log-information off
```

pppoe-server max-sessions local-mac

Syntax **pppoe-server max-sessions local-mac** *number*

undo pppoe-server max-sessions local-mac

View System view

Parameter *number:* Maximum number of sessions that can be established at a local MAC address, in the range 1 to 4069.

Description Use the **pppoe-server max-sessions local-mac** command to set the maximum number of PPPoE sessions that can be established at a local MAC address.

Use the **undo pppoe-server max-sessions local-mac** command to restore the default configuration.

By default, the value of *number* is 100.

Example # Set the maximum number of PPPoE sessions that can be established at a local MAC address to 50.

```
<Sysname> system-view
[Sysname] pppoe-server max-sessions local-mac 50
```

pppoe-server max-sessions remote-mac

Syntax **pppoe-server max-sessions remote-mac** *number*

undo pppoe-server max-sessions remote-mac

View System view

Parameter *number*: Maximum number of PPPoE sessions that can be established by the system with regard to a peer MAC address, in the range 1 to 4096.

Description Use the **pppoe-server max-sessions remote-mac** command to set the maximum number of PPPoE sessions that can be established by the system with regard to a peer MAC address.

Use the **undo pppoe-server max-sessions remote-mac** command to restore the default configuration.

By default, the value of *number* is 100.

Example # Set the maximum number of PPPoE sessions that can be established by the system with regard to a peer MAC address to 50.

```
<Sysname> system-view
[Sysname] pppoe-server max-sessions remote-mac 50
```

pppoe-server max-sessions total

Syntax **pppoe-server max-sessions total** *number*

undo pppoe-server max-sessions total

View System view

Parameter *number*: Maximum number of PPPoE sessions that the system can establish, which ranges from 1 to 65535.

Description Use the **pppoe-server max-sessions total** command to set the maximum number of PPPoE sessions that the system can establish.

Use the **undo pppoe-server max-sessions total** command to restore the default configuration.

By default, the value of *number* is 4096.

Example # Set the maximum number of PPPoE sessions established by the system to 3000.

```
<Sysname> system-view
[Sysname] pppoe-server max-sessions total 3000
```

reset pppoe-server

Syntax **reset pppoe-server** { **all** | **interface** *interface-type interface-number* | **virtual-template** *number* }

View User view

Parameter **all**: Terminates all the PPPoE sessions.

interface *interface-type interface-number*: Specifies an interface by its type and number.

virtual-template *number*: Specifies a virtual template interface.

Description Use the **reset pppoe-server** command to terminate a PPPoE session on the server side.

Example # Terminate the session established on virtual template interface 1 on the server side.

```
<Sysname> reset pppoe-server virtual-template 1
```

34 PPPoE Client Configuration Commands

display pppoe-client session

Syntax **display pppoe-client session** { **packet** | **summary** } [**dial-bundle-number** *number*]

View Any view

Parameter **packet**: Displays the statistics of PPPoE session data packet.

summary: Displays the summary of PPPoE session.

dial-bundle-number *number*: Displays the statistics of the specified PPPoE session, in the range 1 to 255. If PPPoE session is not specified, the system will display the statistics of all PPPoE sessions.

Description Use the **display pppoe-client session** command to display the state and statistics of PPPoE session.

Example # Display the summary of PPPoE session.

```
<Sysname> display pppoe-client session summary
There are 2 sessions in total:
ID   Bundle  Dialer  Intf          Client-MAC    Server-MAC    State
1     1        1     Eth1/0        00e0fc0254f3  00049a23b050  PPPUP
2     2        2     Eth1/0        00e0fc0254f3  00049a23b050  PPPUP
```

Table 86 Description on the fields of display pppoe-client session summary

Field	Description
ID	Session ID, PPPoE session ID
Server-MAC	MAC address of PPPoE server
Client-MAC	MAC address of PPPoE client
Dialer	Corresponding dialer interface of PPPoE session
Bundle	Dialer bundle containing PPPoE session
Intf	Ethernet interface containing PPPoE session
State	State of PPPoE session

Display the statistics of PPPoE session packet

```
<Sysname> display pppoe-client session packet
PPPoE Client Session:
ID    InP         InO         InD         OutP        OutO       OutD
================================================================
```

```
1       164         6126        0           83          1069        0
2       304         9886        0           156         2142        0
```

Table 87 Description on the fields of display pppoe-server session packet

Field	Description
ID	PPPoE session ID
InP	In Packets: number of received packets
InO	In Octets: number of received octets
InD	In Discards: number of illegal packets received and discarded
OutP	Out Packets: number of packets sent
OutO	Out Octets: number of octets sent
OutD	Out Discards: number of illegal packets sent and discarded

pppoe-client dial-bundle-number

Syntax **pppoe-client dial-bundle-number** *number* [**no-hostuniq**] [**idle-timeout** *seconds* [**queue-length** *packets*]]

undo pppoe-client dial-bundle-number *number*

View Ethernet interface view, virtual Ethernet interface view

Parameter **dial-bundle-number** *number*: Dialer bundle number corresponding to PPPoE session, in the range 1 to 255 The *number* argument can be used to uniquely specify a PPPoE session, or as a PPPoE session.

no-hostuniq: The call originated from PPPoE client does not carry the Host-Uniq field. By default, **no-hostuniq** is not configured.

idle-timeout *seconds*: Idle time of PPPoE session in seconds, its value ranges from 1 to 65535. If the parameter is not configured, PPPoE session will work in permanent online mode. Otherwise, it works in packet trigger mode.

queue-length *packets*: packet number cached in the system before PPPoE session is established, its value ranges from 1 to 100. Only after **idle-timeout** is configured will the parameter be enabled. By default, *packets* is 10.

Description Use the **pppoe-client** command to establish a PPPoE session and specify the dialer bundle corresponding to the session.

Use the **undo pppoe-client** command to delete a PPPoE session.

By default, no PPPoE session is configured.

An Ethernet interface can be configured with multiple PPPoE sessions, which means an Ethernet interface can belong to multiple dialer bundles. However, a dialer bundle can own only one Ethernet interface. Each PPPoE session correspond to one dialer bundle. If a dialer bundle at a certain dialer interface has had one Ethernet interface been used by PPPoE, other interfaces cannot be added to this dialer bundle. Likewise, if a dialer bundle has had interfaces other than the PPPoE

Ethernet interface, this dialer bundle can also not be added to the Ethernet interface used by PPPoE Client.

When PPPoE session works in permanent online mode, and the physical lines go UP, the device will immediately initiate PPPoE call to establish PPPoE session. This PPPoE connection will exist constantly unless users use the command **undo pppoe-client** to delete PPPoE session. When PPPoE session works in packet trigger mode, the device will not initiate PPPoE call to establish PPPoE session unless it has data to transmit. If there is no data transmission on the PPPoE link within *seconds*, the device will automatically terminate PPPoE session. Only after it has new data to transmit, PPPoE session will be re-established.

Related command: **reset pppoe-client**.

*The difference between the **reset pppoe-client** command and the undo pppoe-client command lies in: the former only temporarily terminates a PPPoE session, while the latter permanently deletes a PPPoE session.*

No matter a PPPoE session works in permanent on-line mode or in packet triggering mode, it will be deleted permanently by the undo pppoe-client command. If it is necessary to recreate a PPPoE session, the user must reconfigure it.

Example # Create a PPPoE session on the interface Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] pppoe-client dial-bundle-number 1
```

reset pppoe-client

Syntax **reset pppoe-client** { **all** | **dial-bundle-number** *number* }

View User view

Parameter **all**: Clears all PPPoE sessions.

dial-bundle-number *number*: Dialer bundle number, in the range 1 to 255, which is used to clear the PPPoE session corresponding to dialer bundle.

Description Use the **reset pppoe-client** command to terminate PPPoE session and re-initiate the connection later.

When a PPPoE session works in permanent on-line mode, if it is terminated by the **reset pppoe-client** command, the device will automatically recreate a PPPoE session in 16 seconds. When a PPPoE session works in packet triggering mode, if it is terminated via the **reset pppoe-client** command, the device will recreate a PPPoE session only upon data transmission.

Related command: pppoe-client.

*The difference between the **reset pppoe-client** command and the undo pppoe-client command lies in: the former only temporarily terminates a PPPoE session, while the latter permanently deletes a PPPoE session.*

Example # Clear all PPPoE sessions, and re-initiate PPPoE session later.

```
<Sysname> reset pppoe-client all
```

35 PPP DEBUGGING COMMANDS

debugging ppp

Syntax **debugging ppp** { **all** [**interface** *interface-type interface-number*] | **bcp** | **cbcp packet** [**interface** *interface-type interface-number*] | **ccp** | **chap** | **compression iphc** { **rtp** | **tcp** } | **core event** [**interface** *interface-type interface-number*] | **ip packet** [**interface** *interface-type interface-number*] | **ipcp** | **ipv6** | **ipv6cp** | **ipx** | **ipxcp** | **lcp** | **lqc** | **mp** | **mpls-multicast packet** [**interface** *interface-type interface-number*] | **mpls-unicast packet** [**interface** *interface-type interface-number*] | **mplscp** | **osi-npdu** | **osicp** | **pap** | **scp** | **vjcomp** { **all** | **error** | **event** | **packet** | **state**} [**interface** *interface-type interface-number*] }

undo debugging ppp { **all** [**interface** *interface-type interface-number*] | **bcp** | **cbcp packet** [**interface** *interface-type interface-number*] | **ccp** | **chap** | **compression iphc** { **rtp** | **tcp** } | **core event** [**interface** *interface-type interface-number*] | **ip packet** [**interface** *interface-type interface-number*] | **ipcp** | **ipv6** | **ipv6cp** | **ipx** | **ipxcp** | **lcp** | **lqc** | **mp** | **mpls-multicast packet** [**interface** *interface-type interface-number*] | **mpls-unicast packet** [**interface** *interface-type interface-number*] | **mplscp** | **osi-npdu** | **osicp** | **pap** | **scp** | **vjcomp** { **all** | **error** | **event** | **packet** | **state**} [**interface** *interface-type interface-number*] }

View User view

Default Level 1. Monitor level

Parameters **all**: All PPP debugging.

bcp: PPP Bridging Control Protocol (BCP) debugging.

cbcp: PPP Callback Control Protocol (CBCP) debugging.

ccp: PPP Compression Control Protocol (CCP) debugging.

chap: PPP CHAP debugging.

compression: PPP IP header compression (TCP and RTP) debugging.

core: PPP kernel event debugging.

ip: IP packet debugging.

ipcp: IP Control Protocol (IPCP) debugging.

ipv6: IPv6 packet debugging.

ipv6cp: IPv6 Control Protocol (IPv6CP) debugging.

ipx: IPX debugging.

ipxcp: IPX Control Protocol (IPXCP) debugging.

lcp: PPP Link Control Protocol (CCP) debugging.

lqc: PPP link quality control (LQC) debugging.

mp: MP debugging.

mpls-multicast: MPLS multicast debugging.

mpls-unicast: MPLS unicast debugging.

mplscp: MPLS Control Protocol (MPLSCP) debugging.

osi-npdu: OSI NPDU debugging.

osicp: OSI Control Protocol (OSICP) debugging.

pap: PAP debugging.

scp: Stac LZS debugging.

vjcomp: VJ TCP/IP header compression debugging.

error: PPP error debugging.

event: PPP event debugging.

packet: PPP packet debugging.

state: PPP state debugging.

interface-type interface-number: Specifies an interface by its type and number.

Description Use the **debugging ppp** command to enable PPP debugging.

Use the **undo debugging ppp** command to disable PPP debugging.

By default, all PPP debugging is disabled. The following tables describe some significant output fields of PPP debugging commands.

Table 88 Description on the fields of the debugging ppp event command

Field	Description
event	A PPP event occurred.
state	The state of a PPP state machine.
Up	The lower layer went up.
Down	The lower layer went down.
Open	The link was administratively opened.
Close	The link was administratively closed.

Table 88 Description on the fields of the debugging ppp event command

Field	Description
Timeout(T0+,T0-)	A timeout event occurred. T0+ indicates that the restart counter is greater than 0; thus, retransmission is required. T0- indicates that the restart counter is less than 0; thus, retransmission is not needed.
Receive-Configure-Request(RCR+,RCR-)	A Configure-Request packet was received from the peer. RCR+ indicates that the request is acceptable and a Configure-Ack should be sent back. RCR- indicates that the request is unacceptable, and a Configure-Nak or Configure-Rej should be sent back.
Receive-Configure-Ack(RCA)	A valid Configure-Ack packet was received from the peer. The packet is a positive response to a configuration request.
Receive-Configure-Nak/Rej(RCN)	A valid Configure-Nak/Rej packet was received from the peer. The packet is a negative response to some or all requested configuration options.
Receive-Terminate-Request(RTR)	A Terminate-Request packet was received indicating that the peer wanted to close the connection.
Receive-Terminate-Ack(RTA)	A Terminate-Ack packet was received from the peer.
Receive-Unknown-Code(RUC)	An unknown packet was received from the peer.
Receive-Code-Reject, Receive-Protocol-Reject(RXJ+,RXJ-)	A Code-Reject or Protocol-Reject packet was received from the peer. RXJ+ indicates that the rejected options are within the scope of normal operation and thus the rejection is acceptable. RXJ- indicates that the rejected options are not acceptable and link termination will result.
Receive-Echo-Request	An Echo-Request packet was received from the peer.
Receive-Echo-Reply	An Echo-Reply packet was received from the peer.
Receive-Discard-Request(RXR)	A Discard-Request packet was received from the peer.

Table 89 Description on the fields of the debugging ppp ipcp command

Field value	Field name	Description
2	*IP-Compression-Protocol*	The adopted IP compression protocol.
3	*IP Address*	IP address negotiation.
129	*Primary DNS Server Address*	Requested or allocated the primary DNS server.
130	*Primary NBNS Server Address*	Requested or allocated the primary NBNS server.

Table 89 Description on the fields of the debugging ppp ipcp command

Field value	Field name	Description
131	*Secondary DNS Server Address*	Requested or allocated a secondary DNS server.
132	*Secondary NBNS Server Address*	Requested or allocated a secondary NBNS server.

Examples # Two devices are connected using Serial interfaces. Enable PPP on the two interfaces. PPP negotiation starts between them. Enable PPP debugging.

```
*0.784906 Sysname PPP/8/debug2:
  PPP Event:
      Serial2/0 LCP Open  Event
      state initial
```

// On interface Serial 2/0, the LCP state machine was opened and was in the initial state.

```
*0.784906 Sysname PPP/8/debug2:
  PPP State Change:
      Serial2/0 LCP : initial --> starting
```

// LCP moved from the initial state to the starting state.

```
*0.784906 Sysname PPP/8/debug2:
  PPP Event:
      Serial2/0 LCP Lower Up  Event
      state starting
```

// A lower layer up event was reported for LCP. The LCP state machine was in the starting state.

```
*0.784906 Sysname PPP/8/debug2:
  PPP State Change:
      Serial2/0 LCP : starting --> reqsent
```

// LCP moved from the starting state to the reqsent state.

```
*0.784906 Sysname PPP/8/debug2:
  PPP Packet:
      Serial2/0 Output LCP(c021) Pkt, Len 35
      State reqsent, code ConfReq(01), id 2a, len 31
      MRU(1), len 4, val 05dc
      AuthProto(3), len 4, PAP c023
      MagicNumber(5), len 6, val 31180c00
      MRRU(11), len 4, val 05dc
      Discri(13), len 9, val 01fa4d432c8451
```

// Interface Serial 2/0 sent a 35-byte LCP packet. The type of the packet is Configure-Request, its ID is 2a, and its length is 31 bytes with the header removed. The LCP state machine transited to the request sent state as a result. The packet contains these configuration options for negotiation: MRU (the TLV length is four bytes, and the desired MRU value is 05dc); the authentication protocol (the TLV length is four bytes and the desired authentication protocol is PAP); the magic-number (the TLV length is 6 bytes, and the value is 31180c00); the MRRU

(the TLV length is four bytes and the desired MRRU is 05dc); and the endpoint discriminator of MP (the TLV length is 9 bytes, and the value is 01fa4d432c8451.)

36 BRIDGING CONFIGURATION COMMANDS

bridge aging-time

Syntax **bridge aging-time** *seconds*

undo bridge aging-time

View System view

Parameters *seconds*: Aging time of dynamic bridge table entries, in seconds, with an effective range of 10 to 1000000.

Description Use the **bridge aging-time** command to configure the aging time of dynamic bridge table entries.

Use the **undo bridge aging-time** command to restore the default setting.

By default, the aging time of dynamic bridge table entries is 300 seconds.

Example # Set the aging time of dynamic bridge table entries to 500 seconds.

```
<Sysname> system-view
[Sysname] bridge aging-time 500
```

bridge bridge-set enable

Syntax **bridge** *bridge-set* **enable**

undo bridge *bridge-set* **enable**

View System view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

Description Use the **bridge** *bridge-set* **enable** command to enable a bridge set.

Use the **undo bridge** *bridge-set* **enable** command to remove a bridge set.

- *Before you can enable the bridge set feature, you need to enable bridging first.*
- *Other related configurations can take effect only if the bridging and bridge set features are enabled. This command is required for bridge configuration.*

Example # Enable bridge set 1.

```
<Sysname> system-view
[Sysname] bridge 1 enable
```

bridge bridging

Syntax **bridge** *bridge-set* **bridging** { **ip** | **ipx** | **others** }

undo bridge *bridge-set* **bridging** { **ip** | **ipx** | **others** }

View System view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

ip: Specifies the Internet protocol (IP).

ipx: Specifies the internetwork packet exchange (IPX) protocol.

others: Specifies other protocols than IP and IPX.

Description Use the **bridge bridging** command to enable bridging of the specified network layer protocol(s) on the specified bridge set.

Use the **undo bridge bridging** command to disable bridging of the specified network layer protocol(s) on the specified bridge set.

By default, bridging of all network layer protocols is enabled.

Note that non-routable packets will be discarded if bridging of IP or IPX is disabled in a bridge set.

Example # Disable IP bridging on bridge set 1.

```
<Sysname> system-view
[Sysname] undo bridge 1 bridging ip
```

Enable IP bridging on bridge set 1.

```
<Sysname> system-view
[Sysname] bridge 1 bridging ip
```

bridge enable

Syntax **bridge enable**

undo bridge enable

View System view

Parameters None

Description Use the **bridge enable** command to enable the bridging functionality.

Use the **undo bridge enable** command to disable the bridging functionality.

By default, bridging is disabled.

Other related configurations can take effect only if the bridging and bridge set features are enabled. This command is required for bridge configuration.

Example # Enable bridging.

```
<Sysname> system-view
[Sysname] bridge enable
```

bridge learning

Syntax **bridge** *bridge-set* **learning**

undo bridge *bridge-set* **learning**

View System view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

Description Use the **bridge learning** command to enable dynamic address learning to allow the specified bridge set to add dynamic address entries into the bridge table.

Use the **undo bridge learning** command to disable dynamic address learning.

By default, dynamic address learning is enabled, namely all bridge sets are allowed to add dynamic address entries into the bridge table.

Example # Enable dynamic address learning.

```
<Sysname> system-view
[Sysname] bridge 1 learning
```

bridge mac-address

Syntax **bridge** *bridge-set* **mac-address** *mac-address* { **deny | permit** } [**dlsw** | **interface** *interface-type interface-number*]

undo bridge *bridge-set* **mac-address** *mac-address* [**interface** *interface-type interface-number*]

View System view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

mac-address: MAC address, in the format of H-H-H

deny: Discards frames whose source address or destination address is the specified address on all interfaces or the specified interface.

permit: Forwards frames whose source address or destination address is the specified address on all interfaces or the specified interface.

interface: Specifies an outbound interface.

interface-type interface-number: Specifies an interface by its name and number.

dlsw: Specified that the outbound interface is a DLSw module.

Description Use the **bridge mac-address** command to configure a static bridge table entry.

Use the **undo bridge mac-address** command to remove a static bridge table entry.

Example # Configure a static bridge table entry so that Ethernet1/0 can forward frames with a destination MAC address of 0000-0000-0111.

```
<Sysname> system-view
[Sysname] bridge 1 mac-address 0000-0000-0111 permit interface ethernet 1/0
```

bridge routing

Syntax **bridge** *bridge-set* **routing** { **ip** | **ipx** }

undo bridge *bridge-set* **routing** { **ip** | **ipx** }

View System view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

ip: Specifies the Internet protocol (IP).

ipx: Specifies the internetwork packet exchange (IPX) protocol.

Description Use the **bridge routing** command to enable routing of the specified protocol(s) on the specified bridge set.

Use the **undo bridge routing** command to disable routing of the specified protocol(s) on the specified bridge set.

By default, routing of network layer protocols is disabled.

If the bridge set is configured to route the specified protocol, the packets of the protocol that need to be routed will be routed.

Example # Enable IP routing in bridge set 1.

```
<Sysname> system-view
[Sysname] bridge 1 routing ip
```

bridge routing-enable

Syntax **bridge routing-enable**

undo bridge routing-enable

View System view

Parameters None

Description Use the **bridge routing-enable** command to enable bridge routing.

Use the **undo bridge routing-enable** command to disable bridge routing.

By default, bridge routing is disabled.

Routing of a particular protocol can be implemented only if bridge routing is enabled.

Example # Enable bridge routing.

```
<Sysname> system-view
[Sysname] bridge routing-enable
```

bridge-set

Syntax **bridge-set** *bridge-set*

undo bridge-set *bridge-set*

View Interface view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

Description Use the **bridge-set** command to add the current interface into a bridge set.

Use the **undo bridge-set** command to remove the current interface from a bridge set.

By default, a bridge set does not contain any interface.

Example # Add Ethernet1/0 into bridge set 1.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] bridge-set 1
Promiscuous operation mode was set automatically.
```

- *As shown above, after being added into bridge set 1, Ethernet1/0 automatically works in the promiscuous operation mode. When working in the*

promiscuous operation mode, an Ethernet interface forwards all correct frames, without filtering any MAC address.

- *Bridging is possible only between interfaces in the same bridge set.*

As shown above, after being added into bridge set 1, Ethernet1/0 automatically works in the promiscuous operation mode. When working in the promiscuous operation mode, an Ethernet interface forwards all correct frames, without filtering any MAC address.

display bridge address-table

Syntax **display bridge address-table** [**bridge-set** *bridge-set* | **dlsw** | **interface** *interface-type interface-number* | **mac** *mac-address*] [**dynamic** | **static**]

View Any view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

dlsw: Displays the bridge table information about DLSw.

interface-type interface-number : Specifies an interface by its name and number.

mac-address: MAC address, in the format of H-H-H

dynamic: Displays the information about dynamically learned addresses in the bridge table.

static: Displays the information about manually configured about addresses in the bridge table.

Description Use the **display bridge address-table** command to view the bridge table information.

Example # View the information about all the manually configured entries in the bridge table.

```
<Sysname> display bridge address-table static
The total of the address-items is 1
 Mac-address     Set Flag Aging-time    Receive       Send Interface-name
 0000-0001-0001    2   NS   00:02:04          0          0  Ethernet1/0
 Flag meaning:  P--PERMIT   N--DENY  D--DYNAMIC  S--STATIC
```

View the information about a dynamically learned MAC address 1234-5678-1234 in the bridge table.

```
<Sysname> display bridge address-table mac 1234-5678-1234 dynamic
 Mac-address     Set Flag Aging-time    Receive       Send Interface-name
 1234-5678-1234    1   PD   00:02:48         36          0  Ethernet1/0
 Flag meaning:  P--PERMIT   N--DENY  D--DYNAMIC  S--STATIC
```

Table 90 Description on the fields of the display bridge address-table command

Field	Description
Mac-address	MAC address

Table 90 Description on the fields of the display bridge address-table command

Field	Description
Set	Bridge set number
Flag	Flag can be any of the four values: P--PERMIT N--DENY D--DYNAMIC S--STATIC
	P: The permit rule is used for MAC address filtering
	N: The deny rule is used for MAC address filtering
	D: This entry is a dynamic entry
	S: This entry is a static entry
Aging-time	The aging time of bridge table entries
Receive	Number of received frames destined for this MAC address
Send	Number of forwarded frames destined for this MAC address
Interface-name	Outbound interface name

display bridge information

Syntax **display bridge information** [**bridge-set** *bridge-set*]

View Any view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

Description Use the **display bridge information** command to view the information about the specified bridge set or all bridge sets.

Example # View the information about all bridge sets.

```
<Sysname> display bridge information
Bridge module is activated,2 port take part in bridge module at all;
 Address table has 15 item, with  1 static one; life cycle is 300 (s).

Bridge set 1 :
  configure :bridge 1 enable;
             bridging ip, undo bridging ipx; bridging others;
             undo routing ip, undo routing ipx;
             bridge 1 learning
  interface :total 2 interface(s) in the set
             Ethernet1/0 : up
             Ethernet1/1 : up
Bridge set 2 :
  configure :bridge 2 enable;
             bridging ip, undo bridging ipx; bridging others;
             undo routing ip, undo routing ipx;
             bridge 2 learning
  interface :total 2 interface(s) in the set
             Ethernet1/0.1 :up
             Ethernet1/0.2 :up
```

Table 91 Description on the fields of the display bridge information command

Field	Description
configure	Configuration properties of this bridge set. For example, the "configuration" part of bridge set 1 indicates that bridge set 1 can bridge IP packets, it cannot bridge IPX packets, and it can dynamically learn MAC addresses
interface	Interfaces in this bridge sets and their status, where up represents that the interface is active, while "down" represents that the interface is inactive. Bridging is possible only between active interfaces in the same bridge set.

As shown above, bridge set 1 and bridge set 2 in the system are active. The information of each bridge set includes two parts: configure and interface.

display bridge traffic

Syntax **display bridge traffic** [**bridge-set** *bridge-set* | **dlsw** | **interface** *interface-type interface-number*]

View Any view

Parameters *bridge-set*: Displays the statistics information about bridged traffic in the specified bridge set. *bridge-set* must be an integer in the range of 1 to 255.

dlsw: Displays the statistics information of bridged traffic that has passed the DLSw module.

interface-type interface-number: Displays the statistics information about bridged traffic that has passed the specified interface.

Description Use the **display bridge traffic** command to view the statistic information about bridged traffic.

If no parameter is provided, this command displays the statistics about all the bridged traffic on the device.

Example # View the statistics information about bridged traffic that has passed Ethernet1/0.

```
<Sysname> display bridge traffic interface ethernet 1/0
the statistic of interface Ethernet1/0 in bridge set 1 :
Input:
         10 total, 1 bpdu, 2 single,
         0 multi, 0 broadcast;
         0 ip,0 ipx, 0 other protocol;
         0 eth2, 0 snap,
         0 dlsw, 0 other,
         0 vlan;
Output:
         0 total, 0 bpdu, 0 single,
         0 multi, 0 broadcast;
         0 ip, 0 ipx, 0 other protocol;
```

```
          0 eth2, 0 snap,
          0 dlsw, 0 other,
          0 vlan;
Send way:
          0 broadcast, 0 fast, 0 other
Discard:
          0 by import state,
          0 for local frame ,
          0 by mac table,
          0 by import filter,
          0 by outport filter,
          0 by ip filter ,
          0 other
```

Table 92 Description on the fields of the display bridge traffic command

Field	Description
Input	Indicates what kinds of and how many frames were received on this interface. "10 total, 1 bpdu, 2 single," means that totally 10 frames were received on this interface, including one BPDU and two unicast packets
Output	Indicates what kinds of and how many frames were sent out on this interface
Send way	Indicates how frames were sent
Discard	Indicates why and how many frames were discarded
0 by import state	The number of frames discarded due to abnormal inbound interface state
0 for local frame	The number of frames discarded because the source address and destination address map to the same interface
0 by mac table	The number of frames discarded due to denied entries configured in the bridge table
0 by import filter	The number of frames discarded due to the filtering rules configured on the inbound interfaces
0 by outport filter	The number of frames discarded due to the filtering rules configured on the outbound interfaces
0 by ip filter	The number of frames discarded due to the filtering rules configured at the IP layer
0 other	The number of frames discarded due to other reasons

display interface bridge-template

Syntax **display interface bridge-template** [*interface-number*]

View Any view

Parameter *interface-number*: Specifies an bridge-template interface.

Description Use the **display interface bridge-template** command to display the statistics information of a bridge-template interface.

Example # Display the statistics information of bridge-template 1.

```
<Sysname> display interface bridge-template 1
Bridge-template1 current state :UP
Line protocol current state :UP
Description : Bridge-template1 Interface
The Maximum Transmit Unit is 1500
Internet Address is 2.0.0.1/30
IP Sending Frames' Format is PKTFMT_ETHNT_2, Hardware address is 000f-e207-f301
IPv6 Packet Frame Type: PKTFMT_ETHNT_2,  Hardware Address: 000f-e200-1234
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards)  0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
Last 300 seconds input:  0 bytes/sec 0 packets/sec
Last 300 seconds output:  0 bytes/sec 0 packets/sec
     0 packets input, 0 bytes, 0 drops
     0 packets output, 0 bytes, 0 drops
```

Table 93 Description on the fields of display interface bridge-template

Field	Description
Bridge-template1 current state :UP	State of the bridge-template interface
Line protocol current state	State of the data link layer protocol (UP/DOWN)
Description : : Bridge-template1 Interface	Descriptive string of the interface
The Maximum Transmit Unit	MTU of the interface
Internet Address is 2.0.0.1/30	IP address of the interface
IP Packet Frame Type	Packet encapsulation format
Hardware Address	Hardware address (MAC address)
IPv6 Packet Frame Type	IPv6 packet encapsulation formats
Output queue : (Urgent queue : Size/Length/Discards)	Statistics for output queue: ■ Packet statistics for the urgent queue ■ Packet statistics for the protocol queue ■ Packet statistics for the FIFO queue
Output queue : (Protocol queue : Size/Length/Discards)	
Output queue : (FIFO queuing : Size/Length/Discards)	
Last 300 seconds input: 0 bytes/sec 0 packets/sec Last 300 seconds output: 0 bytes/sec 0 packets/sec	Average rate at which packets are input and output through the current interface in the last 300 seconds (in bytes per second)
0 packets input, 0 bytes, 0 drops	Total number and total size in bytes of input packets and the number of dropped packets on the interface
0 packets output, 0 bytes, 0 drops	Total number and size in bytes of output packets and the number of dropped packets on the interface

fr map bridge

Syntax **fr map bridge** *dlci* **broadcast**

undo fr map bridge *dlci*

View Interface view

Parameters *dlci*: Local virtual circuit number, in the range of 16 to 1007

broadcast: Specifies to allow bridging of broadcasts over this FR-to-bridging mapping.

Description Use the **fr map bridge** command to create an FR-to-bridging mapping on the specified virtual circuit.

Use the **undo fr map bridge** command to remove an FR-to-bridging mapping.

By default, no FR-to-bridging mappings exist.

Related command: **display fr map-info** on page 376.

Example # Create an FR-to-bridging mapping on the virtual circuit by the DLCI of 50 on Serial2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] link-protocol fr
[Sysname-Serial2/0] fr interface-type dce
[Sysname-Serial2/0] fr dlci 50
[Sysname-Serial2/0] bridge-set 1
[Sysname-Serial2/0] fr map bridge 50 broadcast
```

interface bridge-template

Syntax **interface bridge-template** *bridge-set*

undo interface bridge-template *bridge-set*

View System view

Parameters *bridge-set*: Bridge set number, an integer in the range of 1 to 255.

Description Use the **interface bridge-template** command to create a bridge-template interface for a bridge set.

Use the **undo interface bridge-template** command to remove a bridge-template interface.

A bridge set can have only one bridge-template interface.

Related command: **bridge routing-enable**.

Example # Create a bridge-template interface for bridge set 1.

```
<Sysname> system-view
[Sysname] interface bridge-template 1
[Sysname-Bridge-template1]
```

mac-address (bridge-template interface view)

Syntax **mac-address** *mac-address*

undo mac-address

View Bridge-template interface view

Parameters *mac-address*: MAC address, in the format of H-H-H

Description Use the **mac-address** command to configure a MAC address for the current bridge-template interface.

Use the **undo mac-address** command to configure the configured MAC address of the current bridge-template interface.

By default, if a bridge set contains Ethernet interfaces, its bridge-template interface will use the MAC address of a random Ethernet interface. If the bridge set contains no Ethernet interfaces, its bridge-template interface will use the system default MAC address.

Related command: **interface bridge-template**.

Different models of devices may have different deferent system default MAC addresses. Refer to your specific device model.

Example # Set the MAC address of the bridge-template interface of bridge set 1 to 0000-0011-0011.

```
<Sysname> system-view
[Sysname] interface bridge-template 1
[Sysname-Bridge-template1] mac-address 0000-0011-0011
```

map bridge-group

Syntax **map bridge-group broadcast**

undo map bridge-group

View PVC view

Parameters None

Description Use the **map bridge-group broadcast** command to enable bridging over the current PVC.

Use the **undo map bridge-group** command to disable bridging over the current PVC.

By default, bridging over a PVC is disabled. If you configure both the **map bridge virtual-ethernet** and **map bridge-group** commands, only the **map bridge virtual-ethernet** takes effect.

Example # Enable bridging over PVC 32/102.

```
<Sysname> system-view
[Sysname] interface atm 1/0
[Sysname-Atm1/0] pvc 32/102
[Sysname-atm-pvc-Atm1/0-32/102] map bridge-group broadcast
```

reset bridge address-table

Syntax **reset bridge address-table** [**bridge-set** *bridge-set* | **dlsw** | **interface** *interface-type interface-number*]

View User view

Parameters *bridge-set*: Clears MAC address entries of the specified bridge set. *bridge-set* must be an integer in the range of 1 to 255.

dlsw: Clears MAC address entries of the DLSw module.

interface-type interface-number: Clears MAC address entry of the specified interface.

Description Use the **reset bridge address-table** command to remove one or more dynamic bridge table entries.

Example # Clear all dynamic entries about bridge set 1 from the bridge table.

```
<Sysname> reset bridge address-table bridge-set 1
```

reset bridge traffic

Syntax **reset bridge traffic** [**bridge-set** *bridge-set* | **dlsw** | **interface** *interface-type interface-number*]

View User view

Parameters *bridge-set*: Clears traffic statistics information about the specified bridge set. *bridge-set* must be an integer in the range of 1 to 255.

dlsw: Clears the traffic statistics information about the DLSw module.

interface-type interface-number: Clears the traffic statistics information about the specified interface.

Description Use the **reset bridge traffic** command to clear the statistic information about bridged traffic.

Example # Clear the traffic statistics information about bridge set 1.

```
<Sysname> reset bridge traffic bridge-set 1
```

x25 map bridge

Syntax **x25 map bridge x121-address** *x.121-address* **broadcast**

undo x25 map bridge x121-address *x.121-address*

View Interface view

Parameters **x121-address** *x.121-address*: X.121 address of the peer host.

broadcast: Enables bridging of broadcasts to the X.25 destination.

Description Use the **x25 map bridge** command to create an X.25-to-bridging mapping.

Use the **undo x25 map bridge** command to remove an X25-to-bridging mapping.

By default, no X.25-to-bridging mappings exist.

Related command: **display x25 map** on page 426.

Example # Create an X.25-to-bridging mapping on Serial2/0.

```
<Sysname> system-view
[Sysname] interface serial 1/0
[Sysname-Serial1/0] link-protocol x25
[Sysname-Serial1/0] x25 x121-address 100
[Sysname-Serial1/0] x25 map bridge x121-address 20112451 broadcast
[Sysname-Serial1/0] bridge-set 1
```

37 ISDN CONFIGURATION COMMANDS

dialer isdn-leased (ISDN BRI interface view)

Syntax **dialer isdn-leased** { **128k** | *number* }

undo dialer isdn-leased { **128k** | *number* }

View ISDN BRI interface view

Parameter **128k**: 128 kbps ISDN leased line connection.

number: 64 kbps ISDN leased line connection. It can be 0 for the first B channel or 1 for the second B channel.

Description Use the **dialer isdn-leased 128k** command to configure 128 kbps leased line connection.

Use the **undo dialer isdn-leased 128k** command to remove 128 kbps leased line connection.

Use the **dialer isdn-leased** *number* command to configure 64 kbps leased line connection.

Use the **undo dialer isdn-leased** *number* command to remove 64 kbps leased line connection.

By default, no ISDN leased line connection is configured.

You must manually remove the existing leased line configuration before switching from single B channel leased line to 128 kbps leased line.

- *You cannot configure this command on the BRI interfaces provided by 2S1B modules.*
- *For more information about configuring ISDN leased lines on CE1/PRI and CT1/PRI interfaces, refer to "dialer isdn-leased (physical interface view)" on page 320.*

Example # Configure 128 kbps leased line connection.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] dialer isdn-leased 128k
```

display isdn active-channel

Syntax **display isdn active-channel** [**interface** *interface-type interface-number*]

View Any view

Parameter *interface-type interface-number:* Specifies an interface by its type and number.

Description Use the **display isdn active-channel** command to view the active call information on ISDN interfaces. If no interface has been specified, the system will display the active call information on all the ISDN interfaces.

The displayed information can help you with ISDN call troubleshooting.

Example # Display the active call information on the interface BRI 1/0.

```
<Sysname> display isdn active-channel interface bri 1/0
Bri 1/0
  Channel Info: B1
  Call Property: Digital        Call Type: Out
  Calling Number: -             Calling Subaddress: -
  Called Number: 6688164        Called Subaddress: -
  UserName: -                   IP Address: -
  Start Time: 05-04-30 14:27:52
  Time Used: 00:04:34
```

Table 94 Description on the fields of the display isdn active-channel command

Field	Description
Channel Info	Information about the channel
Call Property	Call property: digital or analog
Call Type	Call type: incoming or outgoing
Calling Number	Calling number
Calling Subaddress	Calling subaddress
Called Number	Called number
Called Subaddress	Called subaddress
UserName	User name used in PPP negotiation for authentication
IP Address	IP address of the peer end
Start Time	Time at which the link was set up
Time Used	Duration of the call

display isdn call-info

Syntax **display isdn call-info** [**interface** *interface-type interface-number*]

View Any view

Parameter *interface-type interface*-number: Specifies an interface by its type and number.

Description Use the **display isdn call-info** command to view the current state of ISDN interfaces. If no interface has been specified, the system will display the current states of all the ISDN interfaces.

Executing this command will output the state of each layer of the ISDN protocol on one or all interfaces, including the information of Q.921, Q.931 and CC modules. You may make troubleshooting based on the output information.

Example # Display the current state of ISDN interface 2/0.

```
<Sysname> display isdn call-info interface bri 2/0
Bri 2/0(User-side): ACTIVE
  Link Layer 1:  TEI = 65, State = MULTIPLE_FRAME_ESTABLISHED
  Link Layer 2:  TEI = NONE, State = TEI_UNASSIGNED
  Link Layer 3:  TEI = NONE, State = TEI_UNASSIGNED
  Link Layer 4:  TEI = NONE, State = TEI_UNASSIGNED
  Link Layer 5:  TEI = NONE, State = TEI_UNASSIGNED
  Link Layer 6:  TEI = NONE, State = TEI_UNASSIGNED
  Link Layer 7:  TEI = NONE, State = TEI_UNASSIGNED
  Link Layer 8:  TEI = NONE, State = TEI_UNASSIGNED
  Network Layer: 1 connection(s)
    Connection 1 :
      CCIndex:0x0055 , State: Active , CES:1 , Channel:0x00000001
      TEI: 65
      Calling_Num[:Sub]:
      Called_Num[:Sub]: 6688164
```

Table 95 Description on the fields of the display isdn call-info command

Field	Description
BRI 2/0(User-side): ACTIVE	Interface BRI 2/0 is operating at the user side of ISDN; the D channel is active
Link Layer 1	Connections 1 through 8 at layer 2 of the BRI interface
…	
Link Layer 8	
TEI	Terminal equipment identifier
State	Current state of the layer 2 link. It can be one of the following:
	TEI_UNASSIGNED
	ASSIGN_AWAITING_TEI
	ESTABLISH_AWAITING_TEI
	TEI_ASSIGNED
	AWAITING_ESTABLISHMENT
	AWAITING_RELEASE
	MULTIPLE_FRAME_ESTABLISHED
	TIMER_RECOVER
	TEI_ASSIGNED_EXT1: a state option for TBR3 test, meaning a deactivation instruction is received from the underlying layer
	TEI_ASSIGNED_EXT2: a state option for TBR3 test, meaning link establishment request is received
Network Layer: 1 connection(s)	Only one network layer connection is present on the interface.

Table 95 Description on the fields of the display isdn call-info command

Field	Description
CCIndex	Index of the call at the CC layer
State	Current state of the layer 3 link of the BRI interface. It can be one of the following:
	NULL
	CALL_INITIATED
	OVERLAP_SENDING
	OUTGOING_CALL_PROCEEDING
	CALL_DELIVERED
	CALL_PRESENT
	CALL_RECEIVED
	CONNECT_REQUEST
	INCOMING_CALL_PROCEEDING
	ACTIVE
	DISCONNECT_REQUEST
	DISCONNECT_INDICATION
	SUSPEND_REQUEST
	RESUME_REQUEST
	RELEASE_REQUEST
	OVERLAP_RECEIVING
CES	Connection endpoint suffix
Channel	ISDN B channel map for the call
Calling_Num[:Sub]:	Calling number: calling sub-address.
Called_Num[:Sub]	Called number: called sub-address

display isdn call-record

Syntax **display isdn call-record** [**interface** *interface-type interface-number*]

View Any view

Parameter *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display isdn call-record** command to view the information of ISDN call history. If no interface is specified, the system displays all ISDN call history.

Executing this command will display information of the calls activated up to now, but the number of retained entries is limited to 100.

Example # Display the information of ISDN call history.

```
<Sysname> display isdn call-record
Call Calling     Called    Start               Stop           Seconds
Type Number      Number    Time                Time              Used
In   10660016  10660016    03-07-05 11:23:09   -                  0
In   10660022  10660022    03-07-05 11:23:09   -                  0
```

```
Out   -          660016       03-07-05 11:23:01   03-07-05 11:23:04  3
Out   -          660022       03-07-05 11:23:01   03-07-05 11:23:04  3
In    10660016   10660016     03-07-05 11:23:01   03-07-05 11:23:04  3
In    10660022   10660022     03-07-05 11:23:01   03-07-05 11:23:04  3
```

Table 96 Description on the fields of the display isdn call-record command

Field	Description
Call Type	Call type: incoming or outgoing
Calling Number	Calling number
Called Number	Called number
Start Time	Time at which the call is set up
Stop Time	Time at which the call is terminated
Seconds Used	Duration of the call in seconds

display isdn parameters

Syntax **display isdn parameters** { *protocol* | **interface** *interface-type interface-number* }

View Any view

Parameter *protocol*: ISDN protocol type, which can be **ans**, **at&t**, **dss1**, **etsi**, **ni**, **ni2**, **ntt**, or **qsig**.

interface-type interface-number*:* Specifies an interface by its type and number.

Description Use the **display isdn parameters** command to view the system parameters at layers 2 and 3 of the ISDN protocol, such as the durations of system timers and frame size.

If only ISDN protocol is specified, the system will display the default system parameters of ISDN.

Example # Display the system parameters of the ISDN protocol DSS1.

```
<Sysname> display isdn parameters dss1
DSS1 ISDN layer 2 system parameters:
 T200(sec)   T201(sec)   T202(sec)    T203(sec)   N200   K(Bri)    K(Pri)
  1           1           2            10          3      1         7

DSS1 ISDN layer 3 system timers:
  Timer-Number      Value(sec)
  T301                    240
  T302                    15
  T303                    4
  T304                    30
  T305                    30
  T308                    4
  T309                    90
  T310                    40
  T313                    4
  T314                    4
  T316                    120
  T317                    10
  T318                    4
  T319                    4
```

```
T321                    30
T322                    4
```

Table 97 Description of the fields of the display isdn parameters command

Item	Description
T200(sec)	Retransmit-timer (in seconds) of the L2 protocol of ISDN
T201(sec)	TEI test request retransmit-timer (in seconds) of the L2 protocol of ISDN
T202(sec)	TEI request retransmit-timer (in seconds) of the ISDN L2 protocol
T203(sec)	The maximum link idle time (in seconds) of the ISDN L2 protocol
N200	The maximum number of retransmissions
K(BRI)	The maximum number of unacknowledged frames (slide window size) on the ISDN BRI port
K(PRI)	The maximum number of unacknowledged frames (slide window size) on the ISDN PRI port
Timer-Number	ISDN L3 timer
Value(sec)	Duration (in seconds) of each ISDN L3 timer

display isdn spid

Syntax **display isdn spid** [**interface** *interface-type interface-number*]

View Any view

Parameter *interface-type interface-number:* Specifies an interface by its type and number.

Description Use the **display isdn spid** command to view information on SPID on the BRI interface encapsulated with the NI protocol.

You may execute this command to view the SPID type, SPID value and some other information when ISDN is running. Executing this command without specifying an interface, you may view information on SPI on all the SPID-supported BRI interfaces.

Example # Display the related information of SPID on the NI-supported interface BRI 1/0.

```
<Sysname> display isdn spid interface bri 1/0
Interface Bri1/0 :
  SPID Type: AUTO

  SPID B1:
  SPID Num:
  Neg State: SPID_UNASSIGNED
  Init State: INIT_NULL

  SPID B2:
  SPID Num:
  Neg State: SPID_UNASSIGNED
  Init State: INIT_NULL
```

```
SPID timer: 30 seconds
SPID resend: 1 times
```

Table 98 Description on the fields of the display isdn spid interface command

Field	Description
SPID Type	SPID Type, which can be NIT, STATIC (having only the L3 initialization process), or AUTO (including both the negotiation and the L3 initialization)
SPID B1	SPID value of the BRI interface B1 channel.
SPID Num	SPID value of the BRI interface. It can be a static configuration or the result of a dynamic negotiation, all depending on the specified SPID Type.
Neg State	Negotiation state of the SPID, which can be SPID_UNASSIGNED, ASSIGN_AWAITING_SPID, SPID_ASSIGNED, ASSIGN_AWAITING_CALL_CLEAR.
Init State	Initialization state of the SPID, which can be INIT_NULL, INIT_IND, INIT_PROCEEDING, INIT_END, INIT_AWAITING_CALL_CLEAR.
SPID B2	SPID value of the BRI interface B2 channel.
SPID timer	Duration of the timer TSPID
SPID resend	SPID message retransmission times

isdn bch-local-manage

Syntax **isdn bch-local-manage** [**exclusive**]

undo isdn bch-local-manage

View ISDN interface view

Parameter **exclusive**: Exclusive local management mode for ISDN B channels. When the B channel indicated by the exchange is inconsistent with the one required by the local end, call failure occurs.

Description Use the **isdn bch-local-manage** command to enable local ISDN B channel management.

Use the **undo isdn bch-local-manage** command to disable the setting.

By default, the local ISDN B channel management is not enabled but is in the charge of ISDN switch.

It is very important to put appropriate control on the B channels used for calls in process, especially in the PRI mode. Proper channel management can improve call efficiency and reduce call loss. Normally, the centralized B channel management provided by exchanges can work well. For this reason, you are recommended to adopt the management function provided by exchanges in most cases, despite the ISDN module can provide the channel management function as well.

Configured with **isdn bch-local-manage** command, the router operates in local B-channel management mode to select available B channels for calls. Despite this, the connected exchange has higher priority in B channel selection. If the B channel

the router selected for a call is different from the one indicated by the exchange, the one indicated by the exchange is used for communication.

Configured with the **isdn bch-local-manage exclusive** command, the router operates in exclusive local B-channel management mode. In this mode, the B channel selected by the router must be adopted for communication. In the Channel ID information element of the call Setup message sent for a call, the router indicates that the B channel is mandatory and unchangeable. If the connected exchange indicates a B channel different from the one selected by the router, call failure occurs.

Example # Enable interface BRI 2/0 local ISDN B channel management.

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname-Bri2/0] isdn bch-local-manage
```

isdn bch-select-way

Syntax **isdn bch-select-way** { **ascending** | **descending** }

View ISDN interface view

Parameter **ascending**: Selects B channels in ascending order.

descending: Selects B channels in descending order.

Description Use the **isdn bch-select-way** command to set a B channel selection method but it does not work when the switch manages ISDN B channel. Meanwhile, the setting of **isdn bch-select-way** is a waste without configuring **isdn bch-local-manage** command on the user side.

When operating in B channel local management mode, the router selects B channels in ascending order by default.

Example # Configure B channel selection method on the interface BRI 2/0 to descending order.

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname-Bri2/0] isdn bch-select-way descending
```

isdn caller-number

Syntax **isdn caller-number** *caller-number*

undo isdn caller-number

View ISDN interface view

Parameter *caller-number*: Caller number that an incoming ISDN call can carry, which is a character string of 1 to 24 characters.

Description Use the **isdn caller-number** command to configure the range of the numbers that the router can receive.

Use the **undo isdn caller-number** command to delete the configured caller number.

Example # Configure the router to receive only the incoming calls from the caller numbers with 400.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0]isdn caller-number 400
```

isdn calling

Syntax **isdn calling** *calling-number*

undo isdn calling

View ISDN interface view

Parameter *calling-number*: Calling number.

Description Use the **isdn calling** command to have the messages from a calling party to a called party carry the calling number. This command mainly applies on BRI interfaces. If a calling party has configured this command on its BRI interface, the call party will be able to see the calling number by viewing the call history information.

Use the **undo isdn calling** command to delete calling number in the messages that a calling party transmitted.

Example # Configure the message from a calling party to a called party on interface BRI 1/0 to carry calling number.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn calling 8060170
```

isdn check-called-number

Syntax **isdn check-called-number** *check-index called-party-number* [: *subaddress*]

undo isdn check-called-number *check-index*

View ISDN interface view.

Parameter *check-index*: Called number or subaddress checking index, which is in the range of 1 to 3.

called-party-number: Called number, a string of 1 to 20 digits.

subaddress: Subaddress, which is a string of digits and/or case-insensitive English letters and is 1 to 20 characters in length.

Description Use the **isdn check-called-number** command to configure the called number or subaddress that the system should verify when receiving a digital call.

Use the **undo isdn check-called-number** command to remove the configuration.

By default, the system does not check the called number or subaddress carried by incoming digital calls.

This command is used for setting the examined item when a digital call is received. If a subaddress is specified, the system will deny an incoming digital call if the calling party sends a wrong subaddress or does not send at all.

Example # Check whether the called number carried by incoming digital calls is 66668888 on the interface BRI 1/0.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn check-called-number 1 66668888
```

isdn check-time

Syntax **isdn check-time** *date-time*

undo isdn check-time

View System view

Parameter *date-time*: Time to be set when ISDN call checking is launched, in the format of **HH:MM**.

Description Use the **isdn check-time** command to enable ISDN call checking and set the time when ISDN call checking is launched.

Use the **undo isdn check-time** command to restore the default.

By default, ISDN call checking is disabled.

With ISDN call checking enabled, the system checks to see whether or not the call control blocks of the CC module and the Q.931 module are synchronized by checking all the ISDN call records on the set time point every day. The ISDN calls whose call control blocks are not synchronized are released.

Example # Enable ISDN call checking and set the time to launch ISDN call checking to 08:30.

```
<Sysname> system-view
[Sysname] isdn check-time 8:30
```

isdn crlength

Syntax **isdn crlength** *call-reference-length*

undo isdn crlength

View ISDN interface view

Parameter *call-reference-length*: ISDN call reference length, which can be one or two bytes.

Description Use the **isdn crlength** command to set length of the call reference used when a call is placed on an ISDN interface.

Use the **undo isdn crlength** command to restore the default ISDN call reference length on the interface.

By default, the call reference length is two bytes for E1 PRI and T1 PRI interfaces and one byte for BRI interfaces.

Call reference is equal to the sequence number that the protocol assigns to each call. It is one or two bytes in length and can be used cyclically.

When the router receives a call from a remote device, it can automatically identify the length of the call reference. However, some devices on the network do not have such capability. In the event that the router is required to place calls to such a device connected to it, you must configure the router to use the same call reference length configured on the connected device.

*You are not allowed to configure this command on an ISDN interface if there is still a call on it. This command can take effect only if it is configured when there is no call on the interface. Alternatively you can manually disable the interface by executing the **shutdown** command, configure the command, and then enable the interface by executing the **undo shutdown** command. The operations, however, will lead to the disconnection of the call existing on the interface.*

Example # Set the call reference length carried by the ISDN messages on the PRI interface serial/0:15 to 1 byte.

```
<Sysname> system-view
[Sysname] interface serial1/0:15
[Sysname-Serial1/0:15] isdn crlength 1
```

isdn ignore connect-ack

Syntax **isdn ignore connect-ack**

undo isdn ignore connect-ack

View ISDN interface view

Parameter None

Description Use the **isdn ignore connect-ack** command to configure the router to switch the ISDN protocol state to ACTIVE to start the data and voice service communications after sending a CONNECT message without having to wait for a CONNECT ACK message. Use the **undo isdn ignore connect-ack** command to restore the default setting.

By default, in the event that the router is communicating with an exchange, the ISDN protocol must wait for the CONNECT ACK message in response to the CONNECT message before it can switch to the ACTIVE state to start data and voice service communications.

- *In the event that the router is communicating with an ISDN exchange, its settings must be the same as those on the exchange.*
- *You are not allowed to configure this command on an ISDN interface if there is still a call on it. This command can take effect only if it is configured when there is no call on the interface. Alternatively, you can manually disable the interface by executing the **shutdown** command, configure the command, and then enable the interface by executing the **undo shutdown** command. The operations, however, will lead to the disconnection of the call existing on the interface.*

Example # Set the call process on the BRI interface 1/0 to proceed to the ACTIVE state without waiting for CONNECT ACK messages.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn ignore connect-ack
```

isdn ignore hlc

Syntax **isdn ignore hlc**

undo isdn ignore hlc

View ISDN interface view

Parameter None

Description Use the **isdn ignore hlc** command to disable ISDN to carry the higher layer compatibility (HLC) information element in the SETUP messages sent when placing voice calls.

Use the **undo isdn ignore hlc** command to configure ISDN to carry the HLC information element in SETUP messages.

By default, HLC information element is carried in SETUP messages when placing voice calls.

- *In the event that the router is communicating with an ISDN exchange, its settings must be the same as those on the exchange.*
- *You are not allowed to configure this command on an ISDN interface if there is still a call on it. This command can take effect only if it is configured when there is no call on the interface. Alternatively, you can manually disable the interface by executing the **shutdown** command, configure the command, and then enable the interface by executing the **undo shutdown** command. The operations, however, will lead to the disconnection of the call existing on the interface.*

Example # Configure ISDN to carry the HLC information element in the SETUP messages for the voice calls placed on the BRI interface 1/0.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn ignore hlc
```

isdn ignore llc

Syntax **isdn ignore llc**

undo isdn ignore llc

View ISDN interface view

Parameter None

Description Use the **isdn ignore llc** command to disable ISDN to carry the Lower Layer Compatibility (LLC) information element in the SETUP messages sent when placing voice calls.

Use the **undo isdn ignore llc** command to configure ISDN to carry the LLC information element in SETUP messages.

By default, LLC information element is carried in SETUP messages when placing voice calls.

- *In the event that the router is communicating with an ISDN exchange, its settings must be the same as those on the exchange.*
- *You are not allowed to configure this command on an ISDN interface if there is still a call on it. This command can take effect only if it is configured when there is no call on the interface. Alternatively, you can manually disable the interface by executing the **shutdown** command, configure the command, and then enable the interface by executing the **undo shutdown** command. The operations, however, will lead to the disconnection of the call existing on the interface.*

Example # Disable ISDN to carry the LLC information element in the SETUP messages for the voice calls placed on the interface BRI 1/0.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn ignore llc
```

isdn ignore sending-complete

Syntax **isdn ignore sending-complete** [**incoming** | **outgoing**]

undo isdn ignore sending-complete [**incoming** | **outgoing**]

View ISDN interface view

Parameter **incoming**: Ignores the Sending Complete Information Element in Setup messages when receiving a call.

outgoing: Sends Setup messages without the Sending Complete Information Element when placing a call.

Description Use the **isdn ignore sending-complete** command to configure the ISDN protocol to ignore the Sending Complete Information Element in Setup messages when receiving a call, or to send Setup messages without the Sending Complete Information Element when placing a call.

Use the **undo isdn ignore sending-complete** command to restore the default setting.

As for the data exchange performed between a router and an ISDN switch, the default is as follows.

- For an incoming call, the router checks the received Setup messages for the Sending Complete Information Element to determine whether or not the number is received completely. If a Setup message does contain the Sending Complete Information Element, the number is not received completely.
- For outgoing calls, a Setup message containing the Sending Complete Information Element indicates that the number is sent completely.

If you execute the **isdn ignore sending-complete** command with no keyword specified, the Sending Complete Information Element-related operations are performed when a router receives a call or places a call.

- *In the event that the router is communicating with an ISDN exchange, its settings must be the same as those on the exchange.*
- *Only with DSS1, QSIG or ETSI on interface ISDN protocol can this command be configured.*

You are not allowed to configure this command on an ISDN interface if there is still a call on it. This command can take effect only if it is configured when there is no call on the interface. Alternatively, you can manually disable the interface by

executing the **shutdown** command, configure the command, and then enable the interface by executing the **undo shutdown** command. The operations, however, will lead to the disconnection of the call existing on the interface.

You can configure this command on an interface only when the ISDN protocol running on the interface is DSS1, Q.SIG, NI2, or ETSI.

Example # Ignore the Sending Complete Information Element in the received SETUP messages.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn ignore sending-complete incoming
```

Disable carrying the Sending Complete Information Element in the transmitted SETUP messages.

```
[Sysname-Bri1/0] isdn ignore sending-complete outgoing
```

isdn L3-timer

Syntax **isdn L3-timer** *timer-name time-interval*

undo isdn L3-timer { **all** | *timer-name* }

View ISDN interface view

Parameter *timer-name*: Name of a L3 timer of the ISDN protocol.

time-interval: Timer duration, which can take on one of the values listed in the following table.

all: Restores the default durations of all the L3 timers.

Table 99 Description of Q931 timers

timer-name	Timer-name	Value range (in seconds)	Default (in seconds)
t301	T301	30 to 1200	240
t302	T302	5 to 60	15
t303	T303	2 to 10	4
t304	T304	10 to 60	30
t305	T305	4 to 30	30
t308	T308	2 to 10	4
t309	T309	10 to 180	90
t310	T310	10 to 180	40
t313	T313	2 to 10	4
t316	T316	20 to 180	120
t322	T322	2 to 10	4

Description Use the **isdn L3-timer** command to configure the duration of an ISDN protocol L3 timer. Use the **undo isdn L3-timer** command to restore the default duration of the ISDN L3 timer on the interface.

You can view the default durations of the L3 timers in the ISDN protocol by executing the **display isdn parameters** command.

Example # Set the duration of the L3 timer T301 on the interface BRI 1/0 to 160 seconds.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn l3-timer t301 160
```

isdn link-mode

Syntax **isdn link-mode p2p**

undo isdn link-mode

View ISDN BRI interface

Parameter None

Description Use the **isdn link-mode p2p** command to configure a BRI interface to operate in the point-to-point mode.

Use the **undo isdn link-mode** command to restore the default BRI interface operating mode.

By default, a BRI interface operates in the point-to-multipoint mode, in which a BRI interface operating on the network side can have multiple end devices attached to it.

Example # Configure BRI1/0 interface to operate in the point-to-point mode.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn link-mode p2p
```

isdn number-property

Syntax **isdn number-property** *number-property* [**calling** | **called**] [**in** | **out**]

undo isdn number-property [**calling** | **called**] [**in** | **out**]

View ISDN interface view

Parameter *number-property*: Type and number scheme of ISDN numbers. The argument takes on a hex value in the range of 0 to 7F. When it is expressed in 8 bits, bits 1 through 4 represent the code scheme, bits 5 through 7 represent the code type, and bit 8 is

reserved. The following table lists the possible number types and code schemes. For more information, see the related protocol reference manual.

Table 100 Types and code schemes of ISDN numbers

Protocol	Field (Bit) value								Definition
		Type			Code scheme				
	8	7	6	5	4	3	2	1	
		Type			Code scheme				
	8	7	6	5	4	3	2	1	
ANSI		0	0	0					User-specified
		0	1	0					National network identification
		0	1	1					International network identification
					0	0	0	0	Unknown/user-specified
					0	0	0	1	Carrier identification code
					0	0	1	1	Data network identification code (ITU-T Recommendation X.121)
AT&T		0	0	0					Unknown
		0	0	1					International number
		0	1	0					National number
		1	0	0					Subscriber number
					0	0	0	0	Unknown
					0	0	0	1	ISDN/telephony numbering loan (Recommendation E.164/E.163)
					1	0	0	1	Private numbering plan
DSS1		0	0	0					Unknown
		0	0	1					International number
		0	1	0					National number
		0	1	1					Network specific number
		1	0	0					Subscriber number
		1	1	0					Abbreviated number
		1	1	1					Reserved for extension
					0	0	0	0	Unknown
					0	0	0	1	ISDN/telephony numbering plan (Recommendation E.164)
					0	0	1	1	Data numbering plan (Recommendation X.121)
					0	1	0	0	Telex numbering plan (Recommendation F.69)
					1	0	0	0	National standard numbering plan
					1	0	0	1	Private numbering plan
					1	1	1	1	Reserved for extension
ETSI		0	0	0					Unknown
		0	0	1					International number
		0	1	0					National number
		0	1	1					Network specific number
		1	0	0					Subscriber number

Table 100 Types and code schemes of ISDN numbers

Protocol	Field (Bit) value								Definition
		Type			Code scheme				
	8	7	6	5	4	3	2	1	
		1	1	0					Abbreviated number
		1	1	1					Reserved for extension
					0	0	0	0	Unknown
					0	0	0	1	ISDN/telephony numbering plan (Recommendation E.164)
					0	0	1	1	Data numbering plan (Recommendation X.121)
					0	1	0	0	Telex numbering plan (Recommendation F.69)
					1	0	0	0	National standard numbering plan
					1	0	0	1	Private numbering plan
					1	1	1	1	Reserved for extension
NI		0	0	0	0	0	0	0	Unknown number in Unknown numbering plan
		0	0	1	0	0	0	1	International number in ISDN numbering plan (Rec. E.164)
		0	1	0	0	0	0	1	National number in ISDN numbering plan (Rec. E.164)
		0	1	1	1	0	0	1	Network specific number in private numbering plan
		1	0	0	0	0	0	1	Local (directory) number in ISDN numbering plan (Rec. E.164)
		1	1	0	1	0	0	1	Abbreviated number in private numbering plan
NTT		0	0	0					Unknown
		0	1	0					National number
		0	1	1					Network specific number
		1	0	0					Subscriber number
					0	0	0	0	Unknown
					0	0	0	1	ISDN/telephony numbering plan (Recommendation E.164)
					1	0	0	1	Private numbering plan
QSIG		0	0	0	0	0	0	0	Unknown number in Unknown numbering plan
		0	0	0	0	0	0	1	Unknown number in ISDN/Telephony numbering plan (ITU-T Rec.E.164/E.163)
		0	0	1	0	0	0	1	International number in ISDN/Telephony numbering plan (ITU-T Rec.E.164/E.163)
		0	1	0	0	0	0	1	National number in ISDN/Telephony numbering plan (ITU-T Rec.E.164/E.163)
		0	1	1	0	0	0	1	Subscriber number in ISDN/Telephony numbering plan (ITU-T Rec.E.164/E.163)
		0	0	0	1	0	0	1	Unknown number in private numbering plan

Table 100 Types and code schemes of ISDN numbers

Protocol	Field (Bit) value								Definition
		Type			Code scheme				
	8	7	6	5	4	3	2	1	
		0	0	1	1	0	0	1	Level 2 regional number in private numbering plan
		0	1	0	1	0	0	1	Level 1 regional number in private numbering plan
		0	1	1	1	0	0	1	PISN specific number in private numbering plan
		1	0	0	1	0	0	1	Level 0 regional number in private numbering plan

The undefined bits in all the protocols are reserved for other purposes.

calling: The specified number property is for calling numbers.

called: The specified number property is for called numbers.

in: The specified number property is for calling numbers and called numbers in incoming ISDN calls.

out: The specified number property is for calling numbers and called numbers in outgoing ISDN calls.

Description

Use the **isdn number-property** command to set the type and code scheme of calling or called numbers in incoming or outgoing ISDN calls.

Use the **undo isdn number-property** command to restore the default.

By default, the system selects ISDN number type and code scheme depending on upper layer service.

If the **isdn number-property** command is configured, the system adopts the configured ISDN number type and code scheme without considering the upper layer service.

The following table shows how to set number type and code scheme.

Table 101 Set the type and code scheme of ISDN numbers

Operation	Command
Set a number type and code scheme for the called numbers in incoming calls	**isdn number-property** *number-property* **called in**
Remove the number type and code scheme for the called numbers in incoming calls	**undo isdn number-property called in**
Set a number type and code scheme for the called numbers in outgoing calls	**isdn number-property** *number-property* **called out**
Remove the number type and code scheme for the called numbers in outgoing calls	**undo isdn number-property called out**
Set a number type and code scheme for the calling numbers in incoming calls	**isdn number-property** *number-property* **calling in**

Table 101 Set the type and code scheme of ISDN numbers

Operation	Command
Remove the number type and code scheme for the calling numbers in incoming calls	**undo isdn number-property calling in**
Set a number type and code scheme for the calling numbers in outgoing calls	**isdn number-property** *number-property* **calling out**
Remove the number type and code scheme for the calling numbers in outgoing calls	**undo isdn number-property calling out**
Set a number type and code scheme for the calling numbers in incoming and outgoing calls	**isdn number-property** *number-property* **calling**
Remove the number type and code scheme for the calling numbers in incoming and outgoing calls	**undo isdn number-property calling**
Set a number type and code scheme for the called numbers in incoming and outgoing calls	**isdn number-property** *number-property* **called**
Remove the number type and code scheme for the called numbers in incoming and outgoing calls	**undo isdn number-property called**
Set a number type and code scheme for the calling and called numbers in incoming calls	**isdn number-property** *number-property* **in**
Remove the number type and code scheme for the calling and called numbers in incoming calls	**undo isdn number-property in**
Set a number type and code scheme for the calling and called numbers in outgoing calls	**isdn number-property** *number-property* **out**
Remove the number type and code scheme for the calling and called numbers in outgoing calls	**Undo isdn number-property out**
Set a number type and code scheme for the calling and called numbers in incoming and outgoing calls	**isdn number-property** *number-property*
Remove the number type and code scheme for the calling and called numbers in incoming and outgoing calls	**undo isdn number-property**

Example # On interface BRI 1/0, set both number type and code scheme of calling numbers in incoming ISDN calls to unknown.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn number-property 0 calling in
```

On interface BRI 1/0, set both number type and code scheme of called numbers in outgoing ISDN calls to unknown.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn number-property 0 called out
```

isdn overlap-sending

Syntax **isdn overlap-sending** [*digits*]

undo isdn overlap-sending

View ISDN interface view

Parameter *digits*: Maximum number of digits that can be sent each time in overlap-sending mode, in the range 1 to 15. The default is 10.

Description Use the **isdn overlap-sending** command to set the system to send the called number information in the overlap mode on the ISDN interface.

Use the **undo isdn overlap-sending** command to set the system to send the called information in full mode.

In overlap-sending mode, the digits of each called number will be sent separately and the number of the digits sent each time can be set using this command.

In full-sending mode, all the digits of each called number will be collected and sent at a time.

By default, full-sending mode applies.

You are not allowed to configure this command on an ISDN interface if there is still a call on it. This command can take effect only if it is configured when there is no call on the interface. Alternatively, you can manually disable the interface by executing the **shutdown** command, configure the command, and then enable the interface by executing the **undo shutdown** command. The operations, however, will lead to the disconnection of the call existing on the interface.

Overlap-sending is only suitable for five ISDN protocols: ANSI, DSS1, ETSI, NI, and QSIG.

Example # Apply the overlap-sending function on the interface BRI 1/0 and set the number of digits allowed to send each time to 12 digits.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn overlap-sending 12
```

isdn pri-slipwnd-size

Syntax **isdn pri-slipwnd-size** *window-size*

isdn pri-slipwnd-size default

View Interface view

Parameter *window-size*: Slide window size in the range of 5 to 14. By default, the slide window size on PRI interfaces is 7.

Description Use the **isdn pri-slipwnd-size** command to set the slide window size on a PRI interface.

Use the **isdn pri-slipwnd-size default** command to restore the default slide window size on the PRI interface.

Example # Configure the slide window size on the interface CE1/PRI 1/0 to 10.

```
<Sysname> system-view
[Sysname] controller e1 1/0
[Sysname-E1 1/0] using ce1
[Sysname-E1 1/0] quit
[Sysname]interface serial 1/0:15
[Sysname-Serial1/0:15] isdn pri-slipwnd-size 10
```

isdn protocol-mode

Syntax **isdn protocol-mode { network | user }**

undo isdn protocol-mode

View Interface view

Parameter *mode*: ISDN protocol mode to be set, which can be **network** (for network side mode) and **user** (for user side mode).

Description Use the **isdn protocol-mode** command to set the protocol mode for an ISDN interface.

Use the **undo isdn protocol-mode** command to restore the default protocol mode.

By default, an ISDN interface operates in the user side mode.

Example # Set the protocol mode to network side mode for BRI 2/0 interface (assuming that the interface is a BSV interface).

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname-Bri2/0] isdn protocol-mode network
```

isdn protocol-type

Syntax **isdn protocol-type** *protocol*

undo isdn protocol-type

View ISDN interface view

Parameter *protocol*: ISDN protocol, which can be **ANSI**,**AT&T**, **DSS1**, **ETSI**, **NI**, **NI2**,**NTT**, or **QSIG**.

Description Use the **isdn protocol-type** command to set the ISDN protocol to be run on an ISDN interface.

Use the **undo isdn protocol-type** command to restore the default.

By default, both BRI and PRI interfaces run ISDN protocol DSS1.

You are allowed to configure:

- ANSI ISDN on BRI and T1 PRI interfaces;
- AT&T ISDN on T1 PRI interfaces;
- DSS1 ISDN on BRI, E1 PRI, and T1 PRI interfaces;
- ETSI ISDN on BRI, E1 PRI, and T1 PRI interfaces;
- NI (National ISDN) on BRI interfaces;
- NI2 (National ISDN) on T1 PRI interfaces;
- QSIG ISDN on E1 PRI and T1 PRI interfaces;
- NTT ISDN on BRI and T1 PRI interfaces.

You are not allowed to configure this command on an ISDN interface if there is still a call on it. This command can take effect only if it is configured when there is no call on the interface. Alternatively, you can manually disable the interface by executing the **shutdown** command, configure the command, and then enable the interface by executing the **undo shutdown** command. The operations, however, will lead to the disconnection of the call existing on the interface.

Example # Apply ISDN ETSI on interface BRI 1/0.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn protocol-type etsi
```

isdn q921-permanent

Syntax **isdn q921-permanent**

undo isdn q921-permanent

View ISDN BRI interface view

Parameter None

Description Use the **isdn q921-permanent** command to enable the Q.921 permanent link function.

Use the **undo isdn q921-permanent** command to disable the Q.921 permanent link function.

After you enable the function, the ISDN BRI interface automatically sets up and maintains one or two Layer 2 links, whether Layer 3 calls are present on it or not. Two Layer 2 links involves when two-TEI mode is enabled on the interface.

Example # Enable the Q.921 permanent link function on interface BRI 2/0.

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname-Bri2/0] isdn q921-permanent
```

isdn send-restart

Syntax **isdn send-restart**

undo isdn send-restart

View System view

Parameter None

Description Use the **isdn send-restart** command to enable PRI interfaces to actively send ISDN RESTART messages.

Use the **undo isdn send-restart** command to disable PRI interfaces to actively send ISDN RESTART messages.

After the function is enabled, PRI interfaces actively send RESTART messages. to clear calls of the remote end before maintaining B channels.

By default, the PRI interface actively sends RESTART messages to the remote end before maintaining B channels.

Example # Enable the PRI interface to send RESTART messages before maintaining B channels.

```
<Sysname> system-view
[Sysname] isdn send-restart
```

isdn spid auto_trigger

Syntax **isdn spid auto_trigger**

View ISDN BRI interface view

Parameter None

Description Use the **isdn spid auto_trigger** command to enable SPID auto-negotiation once on the BRI interface running the NI protocol.

On a BRI interface compliant with the North American ISDN protocol, the router can place a call only after SPID negotiation or initialization. SPID information can be obtained via static configuration or dynamic negotiation. You may manually trigger a new SPID negotiation request by executing this command if the SPID negotiation in dynamic negotiation fails or just for the purpose of testing.

By default, a BRI interface does not originate a SPID negotiation request unless triggered by a call.

This command applies only on the BRI interface running the NI protocol.

Example # Manually trigger a new SPID negotiation request on the interface BRI 1/0.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid auto_trigger
```

isdn spid nit

Syntax **isdn spid nit**

undo isdn spid nit

View ISDN BRI interface view

Parameter None

Description Use the **isdn spid nit** command to set the SPID processing mode to NIT (Not Initial Terminal) on an NI-compliant BRI interface.

Use the **undo isdn spid nit** command to disable the NIT mode on the BRI interface.

By default, NIT mode does not apply on BRI interfaces. Instead, static SPID or dynamic SPID negotiation is applied.

On an NI-compliant BRI interface, calls can be placed only after the SPID negotiation or initialization is finished. When the router is communicating with an NI-compliant exchange that does not support SPID negotiation, you can use this command to set the SPID processing mode on the router to NIT and the ISDN will ignore ISPID negotiation and initialization.

This command applies only on NI-compliant BRI interfaces.

Example # Ignore SPID negotiation and initialization on the interface BRI 1/0, adopting the NIT mode.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid nit
```

isdn spid timer

Syntax **isdn spid timer** *seconds*

undo isdn spid timer

View ISDN BRI interface view

Parameter *seconds*: Duration of the SPID timer, which is in the range of 1 to 255 seconds, and defaults to 30 seconds.

Description Use the **isdn spid timer** command to set the duration of the timer TSPID for an NI-compliant BRI interface to *seconds*.

Use the **undo isdn spid timer** command to restore the default duration of the timer TSPID for the NI-compliant BRI interface.

On a BRI NI-compliant interface, calls can be placed only after the SPID negotiation or initialization is finished. SPID information can be obtained via static configuration or dynamic negotiation. The timer TSPID is started when the terminal originates a negotiation or initialization request by sending the INFORMATION message. You can use this command to modify the duration of TSPID.

This command applies only on NI-compliant BRI interfaces.

Example # Set the duration of TSPID on the interface BRI 1/0 to 50 seconds.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid timer 50
```

isdn spid service

Syntax **isdn spid service** [**audio** | **data** | **speech**]

undo isdn spid service

View ISDN BRI interface view

Parameter **audio**: Supports audio service.

data: Supports data service.

speech: Supports voice service.

Description Use the **isdn spid service** command to configure the service types that must be supported in SPID negotiation on the BRI interface adopting NI protocol.

Use the **undo isdn spid service** command to delete the service types that must be supported in SPID negotiation on the BRI interface adopting NI protocol.

There are three types of services. You can select any one or none. None means all services are supported. By default, SPID needs to support data and voice service simultaneously.

Generally, as for the BRI interface adopting the ISDN NI protocol, you need to negotiate or initialize SPID before originate a call. During negotiation, SPCS may send multiple SPIDs and carry the service types supported by the SPID, therefore, the router needs to choose a proper SPID according to the local service type.

This command can only be applied on the BRI interface adopting NI protocol.

Example # Set the service type supported by BRI interface to data and voice.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid service data
[Sysname-Bri1/0] isdn spid service speech
```

isdn spid resend

Syntax **isdn spid resend** *times*

undo isdn spid resend

View ISDN BRI interface view

Parameter *times*: The number of INFORMATION message retransmission attempts with an integer in the range of 1 to 255 times, which defaults to 1.

Description Use the **isdn spid resend** command to set the number of INFORMATION message retransmission attempts for SPID negotiation or initialization on an NI-compliant BRI interface.

Use the **undo isdn spid resend** command to restore the default number of INFORMATION message retransmission attempts on the interface.

On a BRI interface compliant with the ISDN protocol in North America, calls can be placed only after the SPID negotiation or initialization is finished. The timer TSPID is started when the terminal originates a negotiation or initialization request by sending the INFORMATION message. If the terminal does not receive any response upon the expiration of TSPID, it will retransmit the INFORMAITON message. You can use this command to modify the number of INFORMATION message retransmission attempts.

This command applies only on NI-compliant BRI interfaces.

Example # Set the allowed number of INFORMATION retransmission attempts to five.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid resend 5
```

isdn spid1

Syntax **isdn spid1** *spid* [*LDN*]

undo isdn spid1

View ISDN BRI interface view

Parameter *spid*: String of 1 to 20 digits.

LDN: Local dialing number, a string of 1 to 30 digits.

Description Use the **isdn spid1** command to configure SPID information for the B1 channel on the NI-compliant BRI interface.

Use the **undo isdn spid1** command to remove the SPID information of the B1 channel on the interface.

On a BRI interface compliant with the ISDN protocol (North America), calls can be placed only after the SPID negotiation or initialization is finished. SPID information can be obtained via static configuration or dynamic negotiation. By default, dynamic negotiation. Only after SPID information is configured for the B1 channel on the BRI interface can the system makes the L3 initialization to place calls normally.

In addition, when the router works with an ISDN NI compliant switch (the DMS100 for example) in North America, you must use this command to configure a unique SPID and LDN for each B channel to ensure a successful MP channel call. Otherwise, only one B channel can be brought up. Also note that both SPID and LDN are provided by your service provider and the configuration of LDN voids the configuration of the **isdn calling** command.

By default, Both SPID and LDN for the B1 channel on the BRI interface are null.

This command applies only on NI-compliant BRI interfaces.

Example # Set SPID to "012345" for the B1 channel on the interface BRI 1/0.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid1 012345
```

Assign the SPID 012345 and the LDN 54321 to the B1 channel on the BRI 1/0 interface.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid1 012345 54321
```

isdn spid2

Syntax **isdn spid2** *spid* [*LDN*]

undo isdn spid2

View ISDN BRI interface view

Parameter *spid*: String of 1 to 20 digits.

LDN: Local dialing number, a string of 1 to 30 digits.

Description Use the **isdn spid2** command to configure SPID information for the B1 channel on an NI-compliant BRI interface.

Use the **undo isdn spid2** command to remove the SPID information of the B1 channel on the interface.

On a BRI interface compliant with the ISDN protocol in North America, calls can be placed only after the SPID negotiation or initialization is finished. SPID information can be obtained via static configuration or dynamic negotiation. Only after SPID information is configured for the B2 channel on the BRI interface can the system makes the L3 initialization to place calls normally.

In addition, when the router works with an ISDN NI compliant switch (the DMS100 for example) in North America, you must use this command to configure a unique SPID and LDN for each B channel to ensure a successful MP channel call. Otherwise, only one B channel can be brought up. Also note that both SPID and LDN are provided by your service provider and the configuration of LDN voids the configuration of the **ISDN calling** command.

By default, both SPID and LDN for the B2 channel on the BRI interface are null.

This command applies only on NI-compliant BRI interfaces.

Example # Set SPID to "012345" for the B2 channel on the interface BRI 1/0.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid2 012345
```

Assign the SPID 012345 and the LDN 54321 to the B2 channel on the BRI interface BRI 2/0.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Sysname-Bri1/0] isdn spid2 012345 54321
```

isdn statistics

Syntax **isdn statistics** { **clear** | **continue** | **display** [**flow**] | **start** | **stop** }

View ISDN interface view

Parameter **clear**: Clears the statistics.

continue: Continues counting.

display: Displays the statistics.

display flow: Displays the statistic information about message flows.

start: Starts counting.

stop: Stops counting.

Description Use the **isdn statistics** command to have the system make statistics on the information received and transmitted at an ISDN interface.

By default, no statistics is made on the information transmitted and received at interfaces.

Use the **isdn statistics start** command in the view of an interface to start making statistics on the messages received and transmitted at the interface.

Use the **isdn statistics display** command to view the statistic information.

Use the **isdn statistics continue** command to continue the effort in making statistics.

Use the **isdn statistics display flow** command to view the statistics in the form of flow.

Use the **isdn statistics stop** command to stop making statistics.

Use the **isdn statistics clear** to clear the statistic information.

Example # Start counting incoming and outgoing messages on CE1/PRI interface serial 1/0:15.

```
<Sysname> system-view
[Sysname] interface serial1/0:15
[Sysname-Serial1/0:15] isdn statistics start
```

After a while, stop counting incoming and outgoing messages on CE1/PRI interface serial 1/0:15.

```
[Sysname-Serial1/0:15] isdn statistics stop
```

Display statistics about the received and sent messages forCE1/PRI interface serial 1/0:15.

```
[Sysname-Serial1/0:15] isdn statistics display
Q.931 message received and sent out on current port:
CALL_PROC         Send(0)             Recv(6)
SETUP             Send(6)             Recv(13)
CONN              Send(13)            Recv(5)
SETUP_ACK         Send(0)             Recv(6)
CONNECT_ACK       Send(5)             Recv(13)
DISCONNECT        Send(3)             Recv(16)
RELEASE           Send(1)             Recv(18)
RELEASE_COM       Send(18)            Recv(1)
```

isdn two-tei

Syntax **isdn two-tei**

undo isdn two-tei

View BRI interface view

Parameter None

Description Use the **isdn two-tei** command to have the router requests the connected switch for a new TEI value before calling for a B channel.

Use the **undo isdn two-tei** command to restore the default TEI handling practice on the BRI interface.

This command applies in the situation where the switch with which the router works is an ISDN NI compliant switch (the DMS100 for example) in North America. In this case, you must ensure that the TEI value assigned to each B channel is unique to ensure a successful MP channel call. Otherwise, only one B channel can be brought up and calling for MP fails.

By default, all the B channels on the BRI interface use one TEI value.

Example # Configure the router to request the connected switch for a new TEI value before calling to bring up a B channel.

```
<Sysname> system-view
[Sysname] interface bri 1/0
[Router-Bri1/0] isdn two-tei
```

permanent-active

Syntax **permanent-active**

undo permanent-active

View ISDN BRI interface view

Parameter None

Description Use the **permanent-active** command to specify an ISDN BRI interface to be in permanent active state on physical layer.

Use the **undo permanent-active** command to cancel the configuration.

Note that these two commands are only applicable to ISDN BRI interfaces on BSV boards and operating on network side.

By default, BSV interfaces operating on the network side are not in permanent active state on physical layer.

Note that:

- After you specify a BSV interface operating on the network side to be in permanent active state on physical layer using the **permanent-active** command, no deactivating request is sent to physical layer. In this case, the interface remains in the active state if it is up and the physical link operates smoothly.
- The **permanent-active** command functions differently comparing with the **isdn q921-permanent** command. The former maintains the active state of BRI interfaces on physical layer and is only applicable to BRI interfaces operating on the network side. It cannot activate the BRI interfaces that are in inactive state on physical layer. The latter, however, enables ISDN BRI interfaces operating on user side to set up and maintain Q.921 links automatically. If no Q.921 link is established, the **isdn q921-permanent** command triggers the ISDN BRI interface to establish Q.921 links.

The support for these two commands varies with device models.

Example # Specify BRI 2/0 interface to be in permanent active state on physical layer (assuming that the interface is a BSV interface and operating on network side).

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname-Bri2/0] isdn protocol-mode network
[Sysname-Bri2/0] permanent-active
```

power-source

Syntax **power-source**

undo power-source

View ISDN BRI interface view

Parameter None

Description Use the **power-source** command to enable remote powering on an ISDN BRI interface.

Use the **undo power-source** command to disable remote powering.

Note that these two commands are only applicable to ISDN BRI interfaces on BSV boards and operating on network side.

By default, remote powering is disabled.

The support for these two commands varies with device models.

Example # Enable remote powering on BRI 2/0 interface (assuming that the interface is a BSV interface and operating on network side).

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname-Bri2/0] isdn protocol-mode network
[Sysname-Bri2/0] power-source
```

shutdown

Syntax **shutdown**

undo shutdown

View ISDN interface view

Parameters None

Description Use the **shutdown** command to shut down an ISDN interface.

Use the **undo shutdown** command to bring up an ISDN interface.

By default, an ISDN interface is up.

Examples # Shut down BRI 2/0.

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname- Bri2/0] shutdown
```

Bring up BRI 2/0.

```
<Sysname> system-view
[Sysname] interface bri 2/0
[Sysname- Bri2/0] undo shutdown
```

38 MSTP CONFIGURATION COMMANDS

active region-configuration

Syntax **active region-configuration**

View MST region view

Parameters None

Description Use the **active region-configuration** command to activate your MST region configuration.

When you carry out this command, MSTP will replace the currently running MST region-related parameters with the parameters you have just configured, and will perform spanning tree computing again.

Related commands: **instance**, **region-name**, **revision-level**, **vlan-mapping modulo**, and **check region-configuration**.

Examples # Activate MST region configuration manually.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] active region-configuration
```

check region-configuration

Syntax **check region-configuration**

View MST region view

Parameters None

Description Use the **check region-configuration** command to view all the MST region configuration information, including the region name, VLAN-to-instance mapping and revision level settings.

Be sure that your MST region configurations are correct, especially the VLAN-to-instance mapping table. MSTP-compliant devices are in the same MST region only when they have the same region name, the same VLAN-to-instance

mapping table and the same MSTP revision level setting. A device will not be in a different region if it is different in any of these three settings. You can view all the MST region-related configuration information by using this command and determine the MST region the device is currently in, or check whether the MST region configuration is correct.

Related commands: **instance**, **region-name**, **revision-level**, **vlan-mapping modulo**, and **active region-configuration**.

Examples # View all the configuration information of the MST region

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] check region-configuration
Admin Configuration
   Format selector :0
   Region name     :00b010000001
   Revision level  :0

   Instance   Vlans Mapped
      0       1 to 9, 11 to 4094
     15       10
```

Table 102 Description on the fields of the check region-configuration command

Field	Description
Format selector	Configuration format selector of the MST region
Region name	MST region name
Revision level	Revision level of the MST region
Instance Vlans Mapped	VLAN-to-instance mappings in the MST region

display stp

Syntax **display stp** [**instance** *instance-id*] [**interface** *interface-list*] [**brief**]

View Any view

Parameters **instance** *instance-id*: Displays the spanning tree information of a particular MST instance. The minimum value of *instance-id* is 0, representing the common internal spanning tree (CIST), and the maximum value of *instance-id* is 15.

interface *interface-list*: Displays the spanning tree information on one or multiple ports. You can provide up to 10 port lists, by each of which you can specify an individual port in the form of *interface-type interface-number*, or a port range in the form of *interface-type start-interface-number* **to** *interface-type end-interface-number*, where the end port number must be greater than the start port number.

brief: Displays brief information.

Description Use the **display stp** command to view the MSTP status information and statistics information.

Based on the MSTP status information and statistics information, you can analyze and maintain the network topology or check whether MSTP is working normally.

Note that:

- If you do not specify any MST instance ID or port list, this command will display the MSTP information on all ports. The displayed information is sequenced by MST instance ID and by port name in each MST instance.
- If you specify an MST instance ID, this command will display the MSTP information on all ports in that MST instance. The displayed information is sequenced by port name.
- If you specify a port list, this command will display the MSTP information on the specified ports. The displayed information is sequenced by MST instance ID, and by port name in each MST instance.
- If you specify both an MST instance ID and a port list, this command will display the MSTP information of the specified MST instance on the specified ports.

The MSTP status information includes:

- CIST global parameters: Protocol work mode, device priority in the CIST instance (Priority), MAC address, hello time, max age, forward delay, maximum hops, common root of the CIST, external path cost from the device to the CIST common root, regional root, the internal path cost from the device to the regional root, CIST root port of the device, and status of the BPDU guard function (enabled or disabled).
- CIST port parameters: Port status, role, priority, path cost, designated bridge, designated port, edge port/non-edge port, whether connecting to a point-to-point link, maximum transmission rate (transmit limit), status of the root guard function (enabled or disabled), BPDU format, boundary port/non-boundary port, hello time, max age, forward delay, message age, remaining hops, whether a port in an aggregation group, and whether rapid state transition enabled (designated ports).
- MSTI global parameters: MSTI instance ID, bridge priority of the instance, regional root, internal path cost, MSTI root port, and master bridge.
- MSTI port parameters: Port status, role, priority, path cost, designated bridge, designated port, remaining hops, whether a port in an aggregation group, and whether rapid state transition enabled (for designated ports).

The statistics information includes:

- The number of TCN BPDUs, configuration BPDUs, RST BPDUs and MST BPDUs sent from each port
- The number of TCN BPDUs, configuration BPDUs, RST BPDUs, MST BPDUs and wrong BPDUs received on each port
- The number of BPDUs discarded on each port

Related commands: **reset stp**.

Examples # View the MSTP status information and statistics information.

```
<Sysname> display stp instance 0 interface Ethernet 1/1 to Ethernet
1/4 GigabitEthernet 1/1 to GigabitEthernet 1/4 brief
  MSTID      Port                  Role  STP State     Protection
    0     Ethernet1/1              ALTE  DISCARDING      LOOP
    0     Ethernet1/2              DESI  FORWARDING      NONE
    0     Ethernet1/3              DESI  FORWARDING      NONE
    0     Ethernet1/4              DESI  FORWARDING      NONE
    0     GigabitEthernet1/1       DESI  FORWARDING      NONE
    0     GigabitEthernet1/2       DESI  FORWARDING      NONE
    0     GigabitEthernet1/3       DESI  FORWARDING      NONE
    0     GigabitEthernet1/4*      DESI  FORWARDING      NONE
  (*) means port in aggregation group
```

Table 103 Description on the fields of the display stp command

Field	Description
MSTID	MST instance ID in the MST region
Port	Port name, corresponding to each MST instance
Role	Port role
STP State	MSTP status on the port, including forwarding, discarding, and learning
Protection	Protection type on the port, including root guard, loop guard, and BPDU guard
(*) means port in aggregation group	* indicates a port in an aggregation group

display stp abnormal-port

Syntax **display stp abnormal-port**

View Any view

Parameters None

Description Use the **display stp abnormal-port** command to view the information about abnormally blocked ports.

Any of the following reasons may cause a port to be abnormally blocked:

- Root guard action
- Loop guard action
- MSTP BPDU format compatibility protection action

Examples # View information about abnormally blocked ports.

```
<Sysname> display stp abnormal-port
MSTID       Blocked Port                    Reason
1           Ethernet1/0                  ROOT-Protected
2           Ethernet1/1                  LOOP-Protected
2           Ethernet1/2                  Formatcompatibility-Protected
```

Table 104 Description on the fields of the display stp abnormal-port command

Field	Description
MSTID	MST instance ID
Blocked Port	Name of blocked port, which corresponds to the related MST instance
Reason	Reason that caused abnormal blocking of the port. ■ ROOT-Protected: root guard action ■ LOOP-Protected: loop guard action ■ Formatcompatibility-Protected: MSTP BPDU format compatibility protection action

display stp down-port

Syntax **display stp down-port**

View Any view

Parameters None

Description Use the **display stp down-port** command to view the information about ports blocked by STP protection actions.

These actions include:

- BPDU attack guard action
- MSTP BPDU format compatibility protection action

Examples # View the information about ports blocked by STP protection actions.

```
<Sysname> display stp down-port
Down Port                Reason
Ethernet1/0          BPDU-Protected
Ethernet1/1          Formatfrequency-Protected
```

Table 105 Description on the fields of the display stp abnormal-port command

Field	Description
Down Port	Name of blocked port
Reason	Reason that caused the port to be blocked. ■ BPDU-Protected: BPDU attack guard action ■ Formatfrequency-Protected: MSTP BPDU format compatibility protection action

display stp history

Syntax **display stp** [**instance** *instance-id*] **history**

View Any view

Parameters **instance** *instance-id*: Displays the historic port role calculation information of a particular spanning tree instance. The minimum value of *instance-id* is 0, representing the common internal spanning tree (CIST), and the maximum value of *instance-id* depends on device model.

Description Use the **display stp history** command to view the historic port role calculation information of the specified spanning tree instance or all spanning tree instances.

Note that:

- If you do not specify a spanning tree instance ID, this command will display the historic port role calculation information of all spanning tree instances. The displayed information is sequenced by instance ID, and in the timing of port role calculation in each instance.
- If you specify a spanning tree instance ID, this command will display the historic port role calculation information of only this specified spanning instance, in the timing of port role calculation.

Examples # View the historic port role calculation information of the card on slot 1 in MSTP instance 2.

```
<Sysname> display stp instance 2 history slot 1
 --------------- STP slot 1 history trace ---------------
 -------------------  Instance 2   ---------------------
     Port Ethernet1/1
       Role change   : ROOT->DESI (Aged)
       Time          : 2006/08/08 00:22:56
       Port priority : 0.00e0-fc01-6510 0 0.00e0-fc01-6510 128.1

     Port Ethernet1/2
       Role change   : ALTER->ROOT
       Time          : 2006/08/08 00:22:56
       Port priority : 0.00e0-fc01-6510 0 0.00e0-fc01-6510 128.2
```

Table 106 Description on the fields of the display stp history command

Field	Description
Port	Port name
Role change	A role change of the port (**Aged** means that the change was caused by expiry of a configuration BPDU.)
Time	Time of port role calculation
Port priority	Port priority

display stp region-configuration

Syntax **display stp region-configuration**

View Any view

Parameters None

Description Use the **display stp region-configuration** command to view the currently effective configuration information of the MST region, including the region name, revision level, and user-configured VLAN-to-instance mappings.

Related commands: **stp region-configuration**.

Examples # View the currently effective MST region configuration information.

```
<Sysname> display stp region-configuration
Oper Configuration
   Format selector :0
   Region name     :hello
   Revision level  :0

   Instance   Vlans Mapped
      0       21 to 4094
      1       1 to 10
      2       11 to 20
```

Table 107 Description on the fields of the display stp region-configuration command

Field	Description
Format selector	MSTP-defined format selector
Region name	MST region name
Revision level	Revision level of the MST region
Instance Vlans Mapped	VLAN-to-instance mappings in the MST region

display stp root

Syntax **display stp root**

View Any view

Parameters None

Description Use the **display stp root** command to view the root bridge information of all MSTP instances.

Examples # View the root bridge information of all MSTP instances.

```
<Sysname> display stp root
MSTID    Root Bridge ID       ExtPathCost   IntPathCost     Root Port
0        0.0013.1923.da80         0              0
```

Table 108 Description on the fields of the display stp root command

Field	Description
MSTID	MST instance ID
Root Bridge ID	Root bridge ID
ExtPathCost	External path cost
IntPathCost	Internal path cost

Table 108 Description on the fields of the display stp root command

Field	Description
Root Port	Root port name (displayed only if a port of the current device is the root port of multiple instances)

display stp tc

Syntax **display stp** [**instance** *instance-id*] **tc**

View Any view

Parameters **instance** *instance-id*: Displays the statistics of TC BPDUs (also known as TCN BPDUs) received and sent by all ports in a particular spanning tree instance. The minimum value of *instance-id* is 0, representing the common internal spanning tree (CIST), and the maximum value of *instance-id* depends on the specific device model.

Description Use the **display stp tc** command to view the statistics of TC BPDUs received and sent.

Note that:

- If you do not specify a spanning tree instance ID, this command will display the statistics of TC BPDUs received and sent by all ports in all spanning trees. The displayed information is sequenced by instance ID and by port name in each spanning tree instance.
- If you specify a spanning tree instance ID, this command will display the statistics of TC BPDUs received and sent by all ports in the specified spanning tree instance, in port name order.

Examples # View the statistics of TC BPDUs received and sent by all ports on the card on slot 1 in MSTP instance 0.

```
<Sysname> display stp instance 0 tc slot 1
 -------------- STP slot 1 TC or TCN count -------------
 MSTID      Port                        Receive      Send
   0        Ethernet1/1                   6          4
   0        Ethernet1/2                   0          2
```

Table 109 Description on the fields of the display stp tc command

Field	Description
MSTID	MSTP instance ID in the MST region
Port	Port name
Receive	Number of TC BPDUs received on each port
Send	Number of TC BPDUs received by each port

instance

Syntax **instance** *instance-id* **vlan** *vlan-list*

undo instance *instance-id* [**vlan** *vlan-list*]

View MST region view

Parameters *instance-id*: MST instance ID, in the range of 0 to 15.

vlan-list: VLAN list. You can specify multiple VLANs or VLAN ranges by providing this argument in the form of *vlan-list* = { *vlan-id* [**to** *vlan-id*] }&<1-10>, where, *vlan-id* is in the range of 1 to 4094, and &<1-10> means that you can specify up to 10 VLANs or VLAN ranges for this argument.

Description Use the **instance** command to map the specified VLAN(s) to the specified MST instance.

Use the **undo instance** command to remove the specified VLAN(s) from the specified MST instance and map the removed VLAN(s) to the CIST (MST instance 0).

By default, all VLANs are mapped to the CIST.

Notice that:

- If you specify no VLAN in the **undo instance** command, all VLANs mapped to the specified MST instance will be remapped to the CIST.
- You cannot map the same VLAN to different MST instances. If you map a VLAN that has been mapped to an instance to a new instance, the old mapping will be automatically removed.

Related commands: **region-name**, **revision-level**, **check region-configuration**, **vlan-mapping modulo**, and **active region-configuration**.

Examples # Map VLAN 2 to MST instance 1.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] instance 1 vlan 2
```

region-name

Syntax **region-name** *name*

undo region-name

View MST region view

Parameters *name*: Name of the MST regions, a string of 1 to 32 characters.

Description Use the **region-name** command to configure the MST region name of your device.

Use the **undo region-name** command to restore the MST region name to the default setting.

By default, the MST region name of a device is its MAC address.

The MST region name, the VLAN-to-instance mapping table and the MSTP revision level of a device jointly determine the MST region the device belongs to.

Related commands: **instance**, **revision-level**, **check region-configuration**, **vlan-mapping modulo**, and **active region-configuration**.

Examples # Set the MST region name of the device to "hello".

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] region-name hello
```

reset stp

Syntax **reset stp** [**interface** *interface-list*]

View User view

Parameters **interface** *interface-list*: Clears the spanning tree statistics information on one or multiple ports. You can provide up to 10 port lists, by each of which you can specify an individual port in the form of *interface-type interface-number*, or a port range in the form of *interface-type start-interface-number* **to** *interface-type end-interface-number*, where the end port number must be greater than the start port number.

Description Use the **reset stp** command to clear the MSTP statistics information.

The MSTP statistics information includes the numbers of TCN BPDUs, configuration BPDUs, RST BPDUs and MST BPDUs sent/received through the specified port(s) (STP BPDUs and TCN BPDUs are counted only for the CIST).

This command clears the spanning tree-related statistics information on the specified port(s) if you specify the *interface-list* argument; otherwise, this command clears the spanning tree-related statistics on all ports.

Related commands: **display stp**.

Examples # Clear the spanning tree-related statistics information on ports Ethernet 1/1 through Ethernet 1/3.

```
<Sysname> reset stp interface Ethernet 1/1 to Ethernet 1/3
```

revision-level

Syntax **revision-level** *level*

undo revision-level

View MST region view

Parameters *level*: MSTP revision level, in the range of 0 to 65535. The system default is 0.

Description Use the **region-level** command to configure the MSTP revision level of your device.

Use the **undo region-level** command to restore the MSTP revision level to the default setting.

The MSTP revision level, the MST region name and the VLAN-to-instance mapping table of a device jointly determine the MST region the device belongs to.

Related commands: **instance**, **region-name**, **check region-configuration**, **vlan-mapping modulo**, and **active region-configuration**.

Examples # Set the MSTP revision level of the MST region to 5.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] revision-level 5
```

stp

Syntax **stp** { **enable** | **disable** }

undo stp

View System view, Ethernet interface view, port group view

Parameters **enable**: Enables the MSTP feature.

disable: Disables the MSTP feature.

Description Use the **stp** command to enable or disable the MSTP feature globally or for a port or a group of ports.

Use the **undo stp** command to restore the default MSTP status globally or for a port or a group of ports.

By default, MSTP is enabled for all ports, and disabled globally.

Note that:

- Configured in system view, the setting is effective for the device globally; configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.
- To control MSTP flexibly, you can disable the MSTP feature for certain ports so that they will not take part in spanning tree computing and thus to save the device's CPU resources.
- After you enable MSTP, the device determines whether to work in STP-compatible mode, in RSTP mode or in MSTP mode according to your MSTP work mode setting. After MSTP is disabled, the device becomes a transparent bridge.
- After being enabled, MSTP dynamically maintains spanning tree status of the corresponding VLANs based the received configuration BPDUs. After being disabled, it stops maintaining the spanning tree status.
- Refer to "Link Aggregation Configuration Commands" on page 473 for information about port groups.

Related commands: **stp mode**.

Examples # Enable the MSTP feature globally.

```
<Sysname> system-view
[Sysname] stp enable
```

Disable MSTP on port Ethernet 1/1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] stp disable
```

stp bpdu-protection

Syntax **stp bpdu-protection**

undo stp bpdu-protection

View System view

Parameters None

Description Use the **stp bpdu-protection** command to enable the BPDU guard function for the device.

Use the **undo stp bpdu-protection** command to disable the BPDU guard function for the device.

By default, the BPDU guard function is disabled.

Examples # Enable the BPDU guard function for the device.

```
<Sysname> system-view
[Sysname] stp bpdu-protection
```

stp bridge-diameter

Syntax **stp bridge-diameter** *bridge-number*

undo stp bridge-diameter

View System view

Parameters *bridge-number*: Specifies the switched network diameter, in the range of 2 to 7.

Description Use the **stp bridge-diameter** command to specify the network diameter, namely the maximum number of stations between any two terminal devices on the switched network.

Use the **undo stp bridge-diameter** command to restore the default network diameter setting.

By default, the network diameter of the switched network is 7.

An appropriate setting of hello time, forward delay and max age can speed up network convergence. The values of these timers are related to the network size. You can set these three timers indirectly by setting the network diameter. Based on the network diameter you configured, MSTP automatically sets an optimal hello time, forward delay, and max age for the device. With the network diameter set to 7 (the default), the three timer are also set to their defaults.

Note that this configuration is effective for the CIST and root bridge only, and not for MSTIs.

Related commands: **stp timer forward-delay**, **stp timer hello**, and **stp timer max-age**.

Examples # Set the network diameter of the switched network to 5.

```
<Sysname> system-view
[Sysname] stp bridge-diameter 5
```

stp compliance

Syntax **stp compliance** { **auto | dot1s | legacy** }

undo stp compliance

View Ethernet interface view, port group view

Parameters **auto**: Configures the port(s) to recognize the MSTP BPDU format automatically and accordingly determine the format of MSTP BPDUs to send.

dot1s: Configures the port(s) to receive and send only standard-format (802.1s-compliant) MSTP BPDUs.

legacy: Configures the port(s) to receive and send only compatible-format MSTP BPDUs.

Description Use the **stp compliance** command to configure the mode the port(s) will use to recognize and send MSTP BPDUs.

Use the **undo stp compliance** command to restore the default.

The default mode is **auto**, namely all ports recognize the BPDU format automatically.

Note that:

- Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.
- If the mode is set to **auto** on a port, the port automatically recognizes and resolves the received compatible-format BPDUs or 802.1s-compliant BPDUs, and sends, when needed, compatible-format or 802.1s-compliant BPDUs.
- If the mode is set to **legacy** or **dot1s**, on a port, the port can only receive and send BPDUs of the specified format. If the port is configured not to detect the packet format automatically while it works in the MSTP mode, and if it receives a packet in the format other than as configured, that port will become a designated port, and the port will remain in the discarding state to prevent the occurrence of a loop.

Examples # Configure Ethernet 1/1 to receive and send only standard-format (802.1s) MSTP packets.

```
<Sysname>system-view
[Sysname-Ethernet1/1] stp compliance dot1s
```

Restore the default mode for port Ethernet 1/1 to recognize and send MSTP BPDUs.

```
[Sysname-Ethernet1/1] undo stp compliance
```

stp config-digest-snooping

Syntax **stp config-digest-snooping**

undo stp config-digest-snooping

View System view, Ethernet interface view, port group view

Parameters None

Description Use the **stp config-digest-snooping** command to enable Digest Snooping.

Use the **undo stp config-digest-snooping** command to disable Digest Snooping.

The feature is disabled by default.

Notice that:

- You need to enable this feature both globally and on ports connected to other vendors' devices to make it take effect. It is recommended to enable the feature on all associated ports first and then globally, making all configured ports take effect at the same time to minimize the impact, and disable the feature globally to disable it on all associated ports.
- It is not recommended to enable Digest Snooping on the MST region edge port to avoid loops.
- Refer to "Link Aggregation Configuration Commands" on page 473 for information about port groups.

Examples # Enable global Digest Snooping.

```
<Sysname> system-view
[Sysname] stp config-digest-snooping
```

Enable Digest Snooping on Ethernet 1/1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] stp config-digest-snooping
```

stp cost

Syntax **stp** [**instance** *instance-id*] **cost** *cost*

undo stp [**instance** *instance-id*] **cost**

View Ethernet interface view, port group view

Parameters **instance** *instance-id*: Sets the path cost of the port(s) in a particular MST instance. The minimum value of *instance-id* is 0, representing the CIST, and the maximum value of *instance-id* is 15.

cost: Path cost of the port, the effective range of which depends on the path cost calculation standard adopted.

Description Use the **stp cost** command to set the path cost of the port(s) in the specified MST instance or all MST instances.

Use the **undo stp cost** command to restore the default.

By default, the device automatically calculates the path costs of ports in each MST instance based on the corresponding standard.

Note that:

- Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.
- If you set *instance-id* to 0, you are setting the path cost of the port in the CIST. The path cost setting of a port can affect the role selection of the port. Setting different path costs for the same port in different MST instances allows different VLAN traffic flows to be forwarded along different physical links, thus to enable per-VLAN load balancing. When the path cost of a port is changed, MSTP will re-compute the role of the port and initiate a state transition.
- If you do not provide **instance** *instance-id*, your configuration will take effect in the CIST instance only.

Examples # Set the path cost of port Ethernet 1/3 in MST instance 2 to 200.

```
<Sysname> system-view
[Sysname] interface ethernet 1/3
[Sysname-Ethernet1/3] stp instance 2 cost 200
```

stp edged-port

Syntax **stp edged-port** { **enable** | **disable** }

undo stp edged-port

View Ethernet interface view, port group view

Parameters **enable**: Configures the current port to be an edge port.

disable: Configures the current port to be a non-edge port.

Description Use the **stp edged-port enable** command to configure the current port to be an edge port.

Use the **stp edged-port disable** or **undo stp edged-port enable** command to configure the current port to be a non-edge port.

All Ethernet ports are non-edge ports by default.

Note that:

- Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.
- If a port directly connects to a user terminal rather than another device or a shared LAN segment, this port is regarded as an edge port. When the network topology changes, an edge port will not cause a temporary loop. Therefore, configuring a port as an edge port can enable the port to transition to the forwarding state rapidly. We recommend that you configure an Ethernet port directly connecting to a user terminal as an edge port before to enable it to transition to the forwarding state rapidly.

- Normally, configuration BPDUs from other devices cannot reach an edge port because it does not connect to any other device. Before the BPDU guard function is enabled, if a port receives a configuration BPDU, the port is working actually as a non-edge port even if you have configured in as an edge port.

Examples # Configure port Ethernet 1/1 as a non-edge port.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] stp edged-port disable
```

stp loop-protection

Syntax **stp loop-protection**

undo stp loop-protection

View Ethernet interface view, port group view

Parameters None

Description Use the **stp loop-protection** command to enable the loop guard function for a port or a group of ports.

Use the **undo stp loop-protection** command to restore default loop guard setting for a port of a group of ports.

By default, the loop guard function is disabled.

Note that, configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.

Examples # Enable the loop guard function for port Ethernet 1/1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] stp loop-protection
```

stp max-hops

Syntax **stp max-hops** *hops*

undo stp max-hops

View System view

Parameters *hops*: Maximum hops, in the range of 1 to 40

Description Use the **stp max-hops** command to set the maximum hops of the MST region on the device.

Use the **undo stp max-hops** command to restore the maximum hops to the default setting.

By default, the maximum hops of an MST region is 20.

In the CIST and MST instances, the maximum hops setting configured on the regional root bridge determines the maximum network diameter supported by the MST region. After a configuration BPDU leaves the root bridge, its hop count is decremented by 1 whenever it passes a device. When its hop count reaches 0, it will be discarded by the device that has received it. As a result, devices beyond the maximum hop count are unable to take part in spanning tree computing, and thereby the size of the MST region is limited.

When the current device becomes the root bridge of the CIST or an MSTI, the maximum hops setting configured on the device becomes the network diameter of that spanning tree and restricts the size of that spanning tree in the current MST region.

Devices other than the root bridge in an MST region use the maximum hops setting on the root bridge.

Examples # Set the maximum hops of the MST region to 35.

```
<Sysname> system-view
[Sysname] stp max-hops 35
```

stp mcheck

Syntax **stp mcheck**

View System view/Ethernet interface view

Parameters None

Description Use the **stp mcheck** command to carry out the mCheck operation globally or on a port.

In a switched network, if a port on the device running MSTP (or RSTP) connects to a device running STP, this port will automatically migrate to the STP-compatible mode. However, if the device running STP is removed, this will not be able to migrate automatically to the MSTP (or RSTP) mode, but will remain working in the STP-compatible mode. In this case, you can perform an mCheck operation to force the port to migrate to the MSTP (or RSTP) mode.

Note that the **stp mcheck** command is meaningful only when the device works in the MSTP (or RSTP) mode, not in the STP-compatible mode.

Related commands: **stp mode**.

Examples # Carry out mCheck on port Ethernet 1/1.

```
<Sysname> system-view
[Sysname] interface Ethernet 1/1
[Sysname-Ethernet1/1] stp mcheck
```

stp mode

Syntax **stp mode** { **stp** | **rstp** | **mstp** }

undo stp mode

View System view

Parameters **stp**: Configures the MSTP-compliant device to work in STP-compatible mode.

rstp: Configures MSTP-compliant device to work in RSTP mode.

mstp: Configures MSTP-compliant device to work in MSTP mode.

Description Use the **stp mode** command to configure the MSTP work mode of the device.

Use the **undo stp mode** command to restore the MSTP work mode to the default setting.

By default, an MSTP-compliant device works in MSTP mode.

Related commands: **stp mcheck**, **stp**.

Examples # Configure the MSTP-compliant device to work in STP-compatible mode.

```
<Sysname> system-view
[Sysname] stp mode stp
```

stp no-agreement-check

Syntax **stp no-agreement-check**

undo stp no-agreement-check

View Ethernet interface view, port group view

Parameters None

Description Use the **stp no-agreement-check** command to enable No Agreement Check on port(s).

Use the **undo stp no-agreement-check** command to disable No Agreement Check on port(s).

By default, No Agreement Check is disabled.

The No Agreement Check feature can take effect only on the root port or alternate port.

Examples # Enable No Agreement Check on Ethernet 1/1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] stp no-agreement-check
```

stp pathcost-standard

Syntax **stp pathcost-standard** { **dot1d-1998** | **dot1t** | **legacy** }

undo stp pathcost-standard

View System view

Parameters **dot1d-1998**: The device calculates the default path cost for ports based on IEEE 802.1D-1998.

dot1t: The device calculates the default path cost for ports based on IEEE 802.1t.

legacy: The device calculates the default path cost for ports based on a private standard.

Description Use the **stp pathcost-standard** command to specify a standard for the device to use when calculating the default path cost of the link connected with the device

Use the **undo stp pathcost-standard** command to restore the default setting of the calculation standard.

The default standard used by the device is **legacy**.

Note that if you change the standard that the device uses in calculating the default path cost, the port path cost value set through the **stp cost** command will be out of effect.

Table 110 Link speed vs. path cost

Link speed	Duplex state	802.1D-1998	IEEE 802.1t	Private standard
0	-	65535	200,000,000	200,000
10Mbps	Single Port	100	2,000,000	2,000
	Aggregated Link 2 Ports	100	1,000,000	1,800
		100	666,666	1,600
	Aggregated Link 3 Ports	100	500,000	1,400
	Aggregated Link 4 Ports			

Table 110 Link speed vs. path cost

Link speed	Duplex state	802.1D-1998	IEEE 802.1t	Private standard
100Mbps	Single Port	19	200,000	200
	Aggregated Link 2 Ports	19	100,000	180
		19	66,666	160
	Aggregated Link 3 Ports	19	50,000	140
	Aggregated Link 4 Ports			
1000Mbps	Single Port	4	20,000	20
	Aggregated Link 2 Ports	4	10,000	18
		4	6,666	16
	Aggregated Link 3 Ports	4	5,000	14
	Aggregated Link 4 Ports			
10Gbps	Single Port	2	2,000	2
	Aggregated Link 2 Ports	2	1,000	1
		2	666	1
	Aggregated Link 3 Ports	2	500	1
	Aggregated Link 4 Ports			

In the calculation of the path cost value of an aggregated link, 802.1D-1998 does not take into account the number of ports in the aggregated link. Whereas, 802.1T takes the number of ports in the aggregated link into account. The calculation formula is: Path Cost = 200,000,000/link speed (in 100 kbps), where link speed is the sum of the link speed values of the non-blocked ports in the aggregated link.

Examples # Configure the device to calculate the default path cost for ports based on IEEE 802.1D-1998.

```
<Sysname> system-view
[Sysname] stp pathcost-standard dot1d-1998
```

Configure the device to calculate the default path cost for ports based on IEEE 802.1t.

```
<Sysname> system-view
[Sysname] stp pathcost-standard dot1t
```

stp point-to-point

Syntax **stp point-to-point** { **auto** | **force-false** | **force-true** }

undo stp point-to-point

View Ethernet interface view, port group view

Parameters **auto**: Specifies MSTP detects automatically whether the current port connects to a point-to-point link.

force-false: Specifies the current port to connect to a non-point-to-point link.

force-true: Specifies the current port to connect to a point-to-point link.

Description Use the **stp point-to-point** command to specify whether the current port connects to a point-to-point link.

Use the **undo stp point-to-point** command to restore the default status of the link connected with the current port.

The default setting is **auto**; namely the MSTP-compliant device automatically detects whether an Ethernet port connects to a point-to-point link.

Configured in Ethernet interface view, the setting is effective on the current port only.

Note that:

- Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.
- When connecting to a non-point-to-point link, a port is incapable of rapid state transition.
- If the current port is the master port of aggregated ports or if it works in full duplex mode, the link to which the current port connects is a point-to-point link. We recommend that you use the default setting, namely let MSTP detect the link status automatically.
- This setting is effective to the CIST and all MST instances. If a port is configured as connecting to a point-to-point link or a non-point-to-point link, the setting takes effect for the port in all MST instances. If the physical link to which the port connects is not a point-to-point link and you force it to be a point-to-point link by configuration, your configuration may incur a temporary loop.

Examples # Configure port Ethernet 1/3 as connecting to a point-to-point link.

```
<Sysname> system-view
[Sysname] interface Ethernet 1/3
[Sysname-Ethernet1/3] stp point-to-point force-true
```

stp port-log

Syntax **stp port-log** { **all** | **instance** *instance-id* }

undo stp port-log { **all** | **instance** *instance-id* }

View System view

Parameters **all**: Enables output of port state transition information for all instances.

instance *instance-id*: Enables output of port state transition information for the specified instance. The minimum value of *instance-id* is 0, representing the CIST, and the maximum value of this argument depends on the specific device model.

Description Use the **stp port-log** command to enable output of port state transition information for the specified instance or all instances.

Use the **undo stp port-log** command to disable output of port state transition information for the specified instance or all instances.

Whether this function is enabled by default depends on the specific device model.

Examples # Enable output of port state transition information for instance 2.

```
<Sysname> system-view
[Sysname] stp port-log instance 2
%Aug 16 00:49:41:856 2006 Sysname MSTP/3/PDISC: Instance 2's Etherne
t1/1 has been set to discarding state!
%Aug 16 00:49:41:856 2006 Sysname MSTP/3/PFWD: Instance 2's Ethernet
1/2 has been set to forwarding state!
```

// The information mentioned above shows that in instance 2, that state of both Ethernet 1/1 and Ethernet 1/2 has changed to forwarding.

stp port priority

Syntax **stp** [**instance** *instance-id*] **port priority** *priority*

undo stp [**instance** *instance-id*] **port priority**

View Ethernet interface view, port group view

Parameters **instance** *instance-id*: Sets the priority of the current port(s) in a particular spanning tree instance. The minimum value of *instance-id* is 0, representing the CIST, and the maximum value of *instance-id* is 15.

priority: Port priority, in the range of 0 to 240 at the step of 16 (0, 16, 32..., for example).

Description Use the **stp port priority** command to set the priority of the port(s).

Use the **undo stp port priority** command to restore the default.

By default, the port priority is 128.

Note that:

- Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.

- If you set *instance-id* to 0, you are setting the priority of the port in the CIST. The priority of a port can affect the role selection of the port in the specified MST instance.
- Setting different priorities for the same port in different MST instances allows different VLAN traffic flows to be forwarded along different physical links, thus to enable per-VLAN load balancing.
- When the priority of a port is changed, MSTP will re-compute the role of the port and initiate a state transition.
- If you do not provide **instance** *instance-id*, your configuration will take effect in the CIST instance only.

Examples # Set the priority of port Ethernet 1/3 in MST instance 2 to 16.

```
<Sysname> system-view
[Sysname] interface Ethernet 1/3
[Sysname-Ethernet1/3] stp instance 2 port priority 16
```

stp priority

Syntax **stp** [**instance** *instance-id*] **priority** *priority*

undo stp [**instance** *instance-id*] **priority**

View System view

Parameters **instance** *instance-id*: Sets the priority of the current port(s) in a particular spanning tree instance. The minimum value of *instance-id* is 0, representing the CIST, and the maximum value of *instance-id* is 15.

priority: Port priority, in the range of 0 to 61440 at the step of 4096, namely you can set up to 16 priority values, such as 0, 4096, 8192..., on the device.

Description Use the **stp priority** command to set the priority of the device.

Use the **undo stp priority** command to restore the device priority to the default setting.

By default, the device priority is 32768.

The device priority is involved in spanning tree computing. The device priority is set on a per-instance basis. An MSTP-compliant device can have different priorities in different MST instances.

If you do not provide **instance** *instance-id*, your configuration will take effect in the CIST instance only.

Examples # Set the device priority in MST instance 1 to 4096.

```
<Sysname> system-view
[Sysname] stp instance 1 priority 4096
```

stp region-configuration

Syntax **stp region-configuration**

undo stp region-configuration

View System view

Parameters None

Description Use the **stp region-configuration** command to enter MST region view.

Use the **undo stp region-configuration** command to restore the default MST region configurations.

By default, the default settings are used for all the three MST region parameters. Namely, the device's MST region name is the device's MAC address, all VLANs are mapped to the CIST, and the MSTP revision level is 0.

After you enter MST region view, you can configure the parameters related the MST region, including the region name, VLAN-to-instance mapping and revision level.

Examples # Enter MST region view.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region]
```

stp root primary

Syntax **stp** [**instance** *instance-id*] **root primary**

undo stp [**instance** *instance-id*] **root**

View System view

Parameters **instance** *instance-id*: MST instance ID, in the range of 0 to 15. MST instance 0 represents the CIST.

Description Use the **stp root primary** command to specify the current device as the root bridge of the specified MST instance.

Use the **undo stp root** command to remove the current device as the root bridge of the specified MST instance.

By default, a device is not a root bridge.

Note that:

- If you do not provide **instance** *instance-id*, your configuration will take effect in the CIST instance only.
- There is only one root bridge in effect in a spanning tree instance. If two or more devices have been designated to be root bridges of the same spanning tree instance, MSTP will select the device with the lowest MAC address as the root bridge.
- You can specify a root bridge for each MST instance without caring about the device priority. After specifying the current device as the root bridge or a secondary root bridge, you cannot change the priority of the device.

Examples # Define the current device as the root bridge of MST instance 0.

```
<Sysname> system-view
[Sysname] stp instance 0 root primary
```

stp root secondary

Syntax **stp** [**instance** *instance-id*] **root secondary**

undo stp [**instance** *instance-id*] **root**

View System view

Parameters **instance** *instance-id*: MST instance ID, in the range of 0 to 15. MST instance 0 represents the CIST.

Description Use the **stp root secondary** command to specify the current device as a secondary root bridge of the specified MST instance.

Use the **undo stp root** command to remove the current device as a secondary root bridge of the specified MST instance.

By default, a device is not a secondary root bridge.

Note that:

- If you do not provide **instance** *instance-id*, your configuration will take effect in the CIST instance only.
- You can configure one or more secondary root bridges for each MST instance. When the root bridge of an instance fails or is shut down, the secondary root bridge can take over the role of the instance of the specified MST instance. If you specify more than one secondary root bridge, the secondary root bridge with the lowest Mac address will become the root bridge.
- Upon specifying the current device as the root bridge or a secondary root bridge, you cannot change the priority of the device.

Examples # Define the current device as the secondary root bridge of MST instance 0.

```
<Sysname> system-view
[Sysname] stp instance 0 root secondary
```

stp root-protection

Syntax **stp root-protection**

undo stp root-protection

View Ethernet interface view, port group view

Parameters None

Description Use the **stp root-protection** command to enable the root guard function for a port or a group of ports.

Use the **undo stp root-protection** command to restore default setting of the root guard function for the port(s).

By default, the root guard function is disabled.

Note that, configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.

Examples # Enable the root guard function for port Ethernet 1/1.

```
<Sysname> system-view
[Sysname] interface Ethernet 1/1
[Sysname-Ethernet1/1] stp root-protection
```

stp tc-protection

Syntax **stp tc-protection enable**

stp tc-protection disable

View System view

Parameters None

Description Use the **stp tc-protection enable** command to enable the TC-BPDU attack guard function for the device.

Use the **stp tc-protection disable** command to disable the TC-BPDU attack guard function for the device.

By default, the TC-BPDU attack guard function is enabled.

Examples # Enable the TC-BPDU attack guard function for the device.

```
<Sysname> system-view
[Sysname] stp tc-protection enable
```

stp tc-protection threshold

Syntax **stp tc-protection threshold** *number*

undo stp tc-protection threshold

View System view

Parameters *number*: Maximum number of times the device deletes forwarding address entries within a certain period of time immediately after it receives TC-BPDUs, in the range of 1 to 255.

Description Use the **stp tc-protection threshold** command to configure the maximum number of times the device deletes forwarding address entries within 10 seconds immediately after it receives TC-BPDUs.

Use the **undo stp tc-protection threshold** command to restore the default configuration.

By default, the device limits the maximum number of times of deleting forwarding address entries within a certain period of time immediately after it receives TC-BPDUs to 6 times.

Examples # Set the maximum number of times the device deletes forwarding address entries within a certain period of time immediately after it receives TC-BPDUs to 10.

```
<Sysname> system-view
[Sysname] stp tc-protection threshold 10
```

stp timer forward-delay

Syntax **stp timer forward-delay** *centi-seconds*

undo stp timer forward-delay

View System view

Parameters *centi-seconds*: Forward delay, in the range 400 to 3,000 (in centiseconds). This argument must be a multiple of 100.

Description Use the **stp timer forward-delay** command to set the forward delay timer of the device.

Use the **undo stp timer forward-delay** command to restore the forward delay timer of the device to the default setting.

By default, the forward delay timer is set to 1,500 centiseconds.

In order to prevent temporary loops, a port must go through an intermediate state, the learning state, before it transitions from the discarding state to the

forwarding state, and must wait a certain period of time before it transitions from one state to another to keep synchronized with the remote device during state transition. The forward delay timer set on the root bridge determines the time interval of state transition.

If the current device is the root bridge, the state transition interval of the device depends on the set forward delay value; for a secondary root bridge, its state transition interval is determined by the forward delay timer set on the root bridge.

The setting of the hello time, forward delay and max age timers must meet the following formulae.

- 2 × (forward delay - 1 second) ƒ max age
- Max age ƒ 2 × (hello Time + 1 second)

MSTP can work effectively on the entire network only when the above-mentioned conditions are met; otherwise, network instability will frequently occur. We recommend that you specify the network diameter of the switched network in the **stp bridge-diameter** *bridge-number* command and let MSTP automatically calculate an optimal setting of these three timers.

Related commands: **stp timer hello**, **stp timer max-age**, and **stp bridge-diameter**.

Examples # Set the forward delay timer of the device to 2,000 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer forward-delay 2000
```

stp timer hello

Syntax **stp timer hello** *centi-seconds*

undo stp timer hello

View System view

Parameters *centi-seconds*: Hello time, in the range 100 to 1,000 (in centiseconds). This argument must be a multiple of 100.

Description Use the **stp timer hello** command to set the hello time of the device.

Use the **undo stp timer hello** command to restore the hello time of the device to the default setting.

By default, the hello time is set to 200 centiseconds.

Hello time is the time interval at which MSTP-compliant devices send configuration BPDUs to maintain spanning tree stability. If a device fails to receive configuration BPDUs within the set period of time, a new spanning tree computing process will be triggered due to timeout. The root bridge sends configuration BPDUs at the

interval of the hello time set on the device, while secondary root bridges use the hello time set on the root bridge.

The setting of the hello time, forward delay and max age timers must meet the following formulae.

- 2 × (forward delay - 1 second) ƒ max age
- Max age ƒ 2 × (hello time + 1 second)

MSTP can work effectively on the entire network only when the above-mentioned conditions are met; otherwise, network instability will frequently occur. We recommend that you specify the network diameter of the switched network in the **stp bridge-diameter** *bridge-number* command and let MSTP automatically calculate an optimal setting of these three timers.

Related commands: **stp timer forward-delay**, **stp timer max-age**, and **stp bridge-diameter**.

Examples # Set the hello time of the device to 400 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer hello 400
```

stp timer max-age

Syntax **stp timer max-age** *centi-seconds*

undo stp timer max-age

View System view

Parameters *centi-seconds*: Max age, in the range 600 to 4,000 (in centiseconds). This argument must be a multiple of 100.

Description Use the **stp timer max-age** command to set the max age timer of the device.

Use the **undo stp timer max-age** command to restore the max age timer of the device to the default setting.

By default, the max age is set to 2,000 centiseconds.

MSTP can detect link faults and automatically restore the forwarding state of the redundant link. In the CIST, the device determines whether a configuration BPDU received on a port has expired based on the max age timer. If a port receives a configuration BPDU that has expired, that MST instance needs to re-computed.

The max age timer is not meaningful for MSTIs. If the current device is the root bridge of the CIST, it determines whether a configuration BPDUs has expired based on the configured max age timer; if the current device is not the root bridge of the CIST, it uses the max age timer set on the CIST root bridge.

The setting of the hello time, forward delay and max age timers must meet the following formulae.

- 2 × (forward delay - 1 second) ƒ max age
- Max age ƒ 2 × (hello time + 1 second)

MSTP can work effectively on the entire network only when the above-mentioned conditions are met; otherwise, network instability will frequently occur. We recommend that you specify the network diameter in the **stp bridge-diameter** *bridge-number* command and let MSTP automatically calculate an optimal setting of these three timers.

Related commands: **stp timer forward-delay**, **stp timer hello**, and **stp bridge-diameter**.

Examples # Set the max age timer of the device to 1,000 centiseconds.

```
<Sysname> system-view
[Sysname] stp timer max-age 1000
```

stp timer-factor

Syntax **stp timer-factor** *number*

undo stp timer-factor

View System view

Parameters *number*: Timeout factor, in the range of 1 to 20.

Description Use the **stp timer-factor** command to configure the timeout time of the device by setting the timeout factor. Timeout time = timeout factor × 3 × hello time.

Use the **undo stp timer-factor** command to restore the timeout factor to the default setting.

By default, the timeout factor of the device is set to 3.

After the network topology is stabilized, each non-root-bridge device forwards configuration BPDUs to the surrounding devices at the interval of hello time to check whether any link is faulty. Typically, if a device does not receive a BPDU from the upstream device within nine times the hello time, it will assume that the upstream device has failed and start a new spanning tree calculation process.

In a very stable network, this kind of spanning tree computing may occur because the upstream device is busy. In this case, you can avoid such unwanted spanning tree computing by lengthening the timeout time (by setting the timeout factor to 4 or more). We recommend that you set the timeout factor to 5, or 6, or 7 for a stable network.

Examples # Set the timeout factor of the device to 7.

```
<Sysname> system-view
[Sysname] stp timer-factor 7
```

stp transmit-limit

Syntax **stp transmit-limit** *packet-number*

undo stp transmit-limit

View Ethernet interface view, port group view

Parameters *packet-number*: Maximum number of MSTP packets that the port can send within each hello time, namely the maximum transmission rate of the port, in the range of 1 to 255.

Description Use the **stp transmit-limit** command to set the maximum transmission rate of a port or a group of ports.

Use the **undo stp transmit-limit** command to restore the maximum transmission rate of a port or a group of ports to the default setting.

By default, the maximum transmission rate of all ports of the device is 10.

Note that:

- Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all the ports in the port group.
- A larger maximum transmission rate value represents more MSTP packets that the port will send within each hello time, but this means that more device resources will be used. An appropriate maximum transmission rate setting can prevent MSTP from using an excessive bandwidth resource during network topology instability.

Examples # Set the maximum transmission rate of port Ethernet 1/1 to 5.

```
<Sysname> system-view
[Sysname] interface Ethernet 1/1
[Sysname-Ethernet1/1] stp transmit-limit 5
```

vlan-mapping modulo

Syntax **vlan-mapping modulo** *modulo*

View MST region view

Parameters *modulo*: Modulo value, in the range of 1 to 15.

Description Use the **vlan-mapping modulo** command to map VLANs in the current MST region to MST instances according to the specified modulo value.

By default, all VLANs are mapped to the CIST (instance 0).

You cannot map the same VLAN to different MST instances. If you map a VLAN that has been mapped to an instance to a new instance, the old mapping will be automatically removed.

*By using the **vlan-mapping modulo** command, you can quickly specify a VLAN for each MST instance. This command maps each VLAN to the MST instance whose ID is (VLAN ID-1) %modulo + 1, where (VLAN ID-1) %modulo is the modulo operation for (VLAN ID-1). If the modulo value is 15, for example, then VLAN 1 will be mapped to MSTI 1, VLAN 2 to MSTI 2, VLAN 16 to MSTI 1, VLAN 17 to MSTI 2, and so on.*

Related commands: **region-name**, **revision-level**, **check region-configuration**, and **active region-configuration**.

Examples # Map VLANs to MSTIs as per the modulo value of 8.

```
<Sysname> system-view
[Sysname] stp region-configuration
[Sysname-mst-region] vlan-mapping modulo 8
```

39 VLAN CONFIGURATION COMMANDS

description

Syntax **description** *text*

undo description

View VLAN view/VLAN interface view

Parameter *text*: A string that describes the current VLAN or VLAN interface (Space can be included), case sensitive.

- For VLAN, this is a string of 1 to 32 characters.
- For VLAN interface, this is a string of 1 to 80 characters.

Description Use the **description** command to configure the descriptive string of the current VLAN or VLAN interface.

Use the **undo description** command to restore the default.

By default, the descriptive string for a VLAN is the VLAN ID, for example, "VLAN 0001"; for a VLAN interface is name of the current VLAN interface, for example, "Vlan-interface1 Interface"

Example # Assign a descriptive string "RESEARCH" for VLAN 1.

```
<Sysname> system-view
[Sysname] vlan 1
[Sysname-vlan1] description RESEARCH
```

Assign a descriptive string "VLAN-INTERFACE-2" for VLAN interface 2

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] quit
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] description VLAN-INTERFACE-2
```

display interface vlan-interface

Syntax **display interface vlan-interface** [*vlan-interface-id*]

View Any view

Parameter *vlan-interface-id*: VLAN interface ID.

Description Use the **display interface vlan-interface** command to display the relevant information of a VLAN interface.

Execution of the command with the parameter included will display the information of a specified VLAN interface; otherwise, information on all created VLAN interfaces will be displayed.

Related command: **interface vlan-interface**.

Example # Display the information of VLAN-interface 2.

```
<Sysname> display interface vlan-interface 2
Vlan-interface2 current state: DOWN
Line protocol current state: DOWN
Description: Vlan-interface2 Interface
The Maximum Transmit Unit is 1500
Internet protocol processing : disabled
IP Packet Frame Type: PKTFMT_ETHNT_2,  Hardware Address: 00e0-fc00-0001
IPv6 Packet Frame Type: PKTFMT_ETHNT_2,  Hardware Address: 00e0-fc00-0001
Last 300 seconds input:  0 bytes/sec 0 packets/sec
Last 300 seconds output:  0 bytes/sec 0 packets/sec
     0 packets input, 0 bytes, 0 drops
     0 packets output, 0 bytes, 0 drops
```

Table 111 Description on the fields of the display interface vlan-interface command

Field	Description
Vlan-interface2 current state	The physical state of a VLAN interface
Line protocol current state	The link layer protocol state of a VLAN interface
Description	The description of a VLAN interface
The Maximum Transmit Unit	The MTU of a VLAN interface
Internet protocol processing :	IP processing ability
IP Packet Frame Type	IPv4 outgoing frame format
Hardware address	MAC address corresponding to a VLAN interface
IPv6 Packet Frame Type	IPv6 outgoing frame format
Last 300 seconds input: 0 bytes/sec 0 packets/sec Last 300 seconds output: 0 bytes/sec 0 packets/sec	Average rate of input packets and output packets in the last 300 seconds (in bps)
0 packets input, 0 bytes, 0 drops	Total number and size (in bytes) of the received packets of the interface and the number of the dropped packets
0 packets output, 0 bytes, 0 drops	Total number and size (in bytes) of the transmitted packets of the interface and the number of the dropped packets

display vlan

Syntax **display vlan** [*vlan-id1* [**to** *vlan-id2*] | **all** | **dynamic** | **interface** *interface-type interface-number.subnumber* | **reserved** | **static**]

View Any view

Parameter *vlan-id1*: Displays the information of a VLAN specified by VLAN ID in the range of 1 to 4,094.

vlan-id1 **to** *vlan-id2*: Displays the information of a range of VLANs specified by a VLAN ID range.

all: Displays all current VLAN information except for the reserved VLAN.

dynamic: Displays the information of dynamically VLANs

interface *interface-type interface-number.subnumber*: Displays VLAN information on a specified sub-interface. The *interface-type interface-number.subnumber* parameters specify the interface type and interface number, in which *interface-number* is the main interface number whereas *subnumber* is the sub-interface number, ranging from 1 to 4,094.

reserved: Displays information of the reserved VLANs. Protocol modules determine reserved VLANs according to function implementation, and reserved VLANs serve protocol modules. Reserved VLANs cannot be modified.

static: Displays static VLAN information.

Description Use the **display vlan** command to display VLAN information.

Related command: **vlan**.

Example # Display VLAN 2 information.

```
<Sysname> display vlan 2
VLAN ID: 2
 VLAN Type: static
 Route interface: not configured
 Description: VLAN 0002
Broadcast MAX-ratio: 100%
Tagged   Ports: none
 Untagged Ports:
Ethernet1/1  Ethernet1/2  Ethernet1/3
```

Display VLAN 3 information.

```
<Sysname> display vlan 3
 VLAN ID: 3
 VLAN Type: static
 Route Interface: configured
 IP Address: 1.1.1.1
 Subnet Mask: 255.255.255.0
```

```
Description: VLAN 0003
Tagged   Ports: none
Untagged Ports: none
```

Table 112 Description on the fields of the display vlan command

Field	Description
VLAN ID	VLAN ID
VLAN Type	VLAN type (static or dynamic)
Route interface	Whether the VLAN interface is configured for the VLAN: not configured or configured
Description	VLAN descriptive string
Broadcast MAX-ratio	VLAN broadcast suppression ratio (available only on the device supporting the **broadcast-suppression** command)
IP Address	IP address of the VLAN interface (not display if the VLAN interface has no IP address configured)
Subnet Mask	Subnet mask of the IP address (not display if the VLAN interface has no IP address configured)
Tagged Ports	Tagged ports
Untagged Ports	Untagged ports

interface vlan-interface

Syntax **interface vlan-interface** *vlan-interface-id*

undo interface vlan-interface *vlan-interface-id*

View System view

Parameter *vlan-interface-id*: VLAN interface ID, in the range of 1 to 4,094.

Description Use the **interface vlan-interface** command to enter the specified VLAN interface view. Use the **undo interface vlan-interface** command to delete the specified VLAN interface. The VLAN interface must be created first before entering its view

Before creating a VLAN interface, make sure the corresponding VLAN has been created; otherwise, the VLAN interface cannot be created.

Related command: **display interface vlan-interface**.

Example # Create VLAN interface 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] quit
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2]
```

ip address

Syntax **ip address** *ip-address* { *mask* | *mask-length* } [**sub**]

undo ip address [*ip-address* { *mask* | *mask-length* } [**sub**]]

View VLAN interface view

Parameter *ip-address*: IP address of a VLAN interface, in dotted decimal format.

mask: Subnet mask that corresponds to the IP address of a VLAN interface, in dotted decimal format.

mask-length: Length of a sub-net mask, indicated by the number of "1"s, in the range 0 to 32.

sub: Indicates the address is a sub-IP address of the VLAN interface.

Description Use the **ip address** command to specify the IP address and subnet mask for a VLAN interface.

Use the **undo ip address** command to remove the IP address and sub-net mask for a VLAN interface.

By default, no IP address is configured.

An interface normally has one IP address. To enable a device to connect to multiple subnets, a maximum of 32 IP addresses can be configured on a VLAN interface, in which one is the primary IP address and all the rest are secondary IP addresses. The total number of IP addresses on a VLAN interface varies by device. Their relationship is illustrated as follows:

- A newly configured main IP address will replace the original one, if there is one.
- Using the **undo ip address** command without any parameter indicates that all IP addresses will be deleted from the VLAN interface.
- Use the **undo ip address** *ip-address* { *mask* | *mask-length* } command to delete the main IP address.
- Use the **undo ip address** *ip-address* { *mask* | *mask-length* } **sub** command to delete a sub-interface.
- Note that before deletion of the main IP address you must first delete the sub-IP address.

Related command: **display ip interface** on page 781.

Example # Specify the IP address as 1.1.0.1, the sub-net mask as 255.255.255.0 for the VLAN interface 1.

```
<Sysname> system-view
[Sysname] interface vlan-interface 1
[Sysname-Vlan-interface1] ip address 1.1.0.1 255.255.255.0
```

shutdown

Syntax **shutdown**

undo shutdown

View VLAN interface view

Parameter None

Description Use the **shutdown** command to shut down a VLAN interface.

Use the **undo shutdown** command to bring up a VLAN interface.

By default, the VLAN interface is down if all ports in the VLAN are down, as long as one port in the VLAN is up, the VLAN interface will be up

You can use the **undo shutdown** command to bring up a VLAN interface after configurations of the related parameter and protocol. When there is a fault in a VLAN interface, you can use the **shutdown** command to shut down the interface and then bring it up using the **undo shutdown** command. In this way, the interface will resume Shutting down/bringing up a VLAN interface does not affect any Ethernet ports in the VLAN. The state of an Ethernet port does not change with the VLAN interface state.

Example # Shut down the VLAN interface and then bring it up.

```
<Sysname> system-view
[Sysname] interface vlan-interface 2
[Sysname-Vlan-interface2] shutdown
[Sysname-Vlan-interface2] undo shutdown
```

vlan

Syntax **vlan** { *vlan-id1* [**to** *vlan-id2*] | **all** }

undo vlan { *vlan-id1* [**to** *vlan-id2*] | **all** }

View System view

Parameter *vlan-id1*: VLAN ID, in the range of 1 to 4,094.

vlan-id1 **to** *vlan-id2*: Specifies a VLAN range. Both the *vlan-id1* argument and the *vlan-id2* argument are in the range of 1 to 4094.

all: Creates or deletes all VLANs except reserved VLANs. The keyword is not supported when the number of maximum VLANs that can be created on a device is less than 4094.

Description Use the **vlan** *vlan-id* command to create specified VLAN(s).

If a specified VLAN exists, the command places you into its view.

Use the **undo vlan** command to delete specified VLAN(s).

Note that:

- As the default VLAN, VLAN 1 cannot be created or removed.
- You cannot create/remove reserved VLANs that are reserved for specific function implementation.
- Dynamic VLANs cannot be removed using the **undo vlan** command.
- A VLAN associated with QoS policies cannot be removed.

Related command: **display vlan**.

Example # Enter VLAN 2 view.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2]
```

Create VLAN 4 through VLAN 100.

```
<Sysname> system-view
[Sysname] vlan 4 to 100
Please wait.............. Done.
```

40 PORT-BASED VLAN CONFIGURATION COMMANDS

port

Syntax **port** *interface-list*

undo port *interface-list*

View VLAN interface view

Parameter **interface** *interface-list*: Ethernet interface list, in the format of { *interface-type interface-number* [**to** *interface-type interface-number*] }&<1-10>, where &<1-10> means that you can specify up to 10 port ranges.

Description Use the **port** command to add one Access port or a group of Access ports to a VLAN. Use the **undo port** command to remove one Access port or a group of Access ports from a VLAN.

Note:

- This command is only applicable to Access ports.
- All ports have their default link type configured as Access, however, users can manually configure the port type. For more information, refer to "port link-type" on page 642.

Related command: **display vlan**.

Example # Add the ports from Ethernet 1/1 to Ethernet 1/3 to VLAN 2.

```
<Sysname> system-view
[Sysname] vlan 2
[Sysname-vlan2] port ethernet 1/1 to ethernet 1/3
```

port access vlan

Syntax **port access vlan** *vlan-id*

undo port access vlan

View Ethernet interface view, port group view

Parameter *vlan-id* : VLAN ID, in the range 1 to 4094.

Description Use the **port access vlan** command to add the current Access port to a specified VLAN.

Use the **undo port access vlan** command to add the current Access port to the default VLAN.

Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group. Make sure that the VLAN identified by the *vlan-id* argument exists before issuing the **port access vlan** command.

Refer to "Link Aggregation Configuration Commands" on page 473 for information about port groups.

Example # Add Ethernet 1/1 to VLAN 3.

```
<Sysname> system-view
[Sysname] vlan 3
[Sysname-vlan3] quit
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port access vlan 3
```

port hybrid pvid vlan

Syntax **port hybrid pvid vlan** *vlan-id*

undo port hybrid pvid

View Ethernet interface view, port group view

Parameter *vlan-id* : VLAN ID, in the range 1 to 4094.

Description Use the **port hybrid pvid vlan** command to configure the default VLAN ID of the Hybrid port.

Use the **undo port hybrid pvid** command to restore the default, VLAN 1.

Execution of the **undo vlan** command on a Hybrid port to remove the default VLAN does not affect the default VLAN configuration. That is to say, the non-existent VLAN can still be the default VLAN.

Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group.

Refer to "Link Aggregation Configuration Commands" on page 473 for information about port groups.

The default VLAN ID of local Hybrid port must be consistent with that of the peer; otherwise, packets cannot be forwarded properly.

Related command: **port link-type**.

Example # Configure the default VLAN ID for the Hybrid port Ethernet 1/0 to be 100.

```
<Sysname> system-view
[Sysname] vlan 100
[Sysname-vlan100] quit
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port link-type hybrid
[Sysname-Ethernet1/0] port hybrid pvid vlan 100
```

port hybrid vlan

Syntax **port hybrid vlan** *vlan-id-list* { **tagged** | **untagged** }

undo port hybrid vlan *vlan-id-list*

View Ethernet interface view, port group view

Parameter *vlan-id-list*: The range of VLANs that the Hybrid ports will be added to, *vlan-id-list* = [*vlan-id1* [**to** *vlan-id2*]]&<1-10>, where *vlan-id* ranges from 1 to 4,094 and &<1-10> indicates that you can specify up to 10 times.

tagged: Specifies to tag the packets of the specified VLAN (s).

untagged: Specifies not to tag the specified VLAN(s).

Description Use the **port hybrid vlan** command to add the current Hybrid port to the specified VLAN(s).

Use the **undo port hybrid vlan** command to remove the current Hybrid port from the specified VLAN(s).

A hybrid port can belong to multiple VLANs and thus can allow packets of multiple VLANs to pass. Repetitive execution of the **port hybrid vlan** *vlan-id-list* { **tagged** | **untagged** } command will yield a set VLANs, to which the Hybrid port belongs.

Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group.

Refer to “Link Aggregation Configuration Commands” on page 473 for information about port groups.

Related command: **port link-type**.

Example # Add the Hybrid port Ethernet 1/0 to VLAN 2, VLAN 4, and the range of VLANs from VLAN 50 to VLAN 100. Tag all packets of these VLANs.

```
<Sysname> system-view
[Sysname] vlan all
Please wait... Done.
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port link-type hybrid
[Sysname-Ethernet1/0] port hybrid vlan 2 4 50 to 100 tagged
```

port link-type

Syntax **port link-type** { **access** | **hybrid** | **trunk** }

undo port link-type

View Ethernet interface view, port group view

Parameter **access**: Configures the link type of a port as Access.

hybrid: Configures the link type of a port as Hybrid.

trunk: Configures the link type of a port as Trunk.

Description Use the **port link-type** command to configure the link type of a port.

Use the **undo port link-type** command to restore the default link type of a port.

Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group.

Refer to "Link Aggregation Configuration Commands" on page 473 for information about port groups.

By default, a port is an Access port.

Example # Configure Ethernet 1/0 to be a Trunk port.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port link-type trunk
```

port trunk permit vlan

Syntax **port trunk permit vlan** { *vlan-id-list* | **all** }

undo port trunk permit vlan { *vlan-id-list* | **all** }

View Ethernet interface view, port group view

Parameter *vlan-id-list*: The range of VLANs that the Hybrid ports will be added to, in the format of *vlan-id-list* = [*vlan-id1* [**to** *vlan-id2*]]&<1-10>, where *vlan-id* ranges from 1 to 4,094 and &<1-10> indicates that you can specify up to 10 parameters.

all: Adds the Trunk port to all VLANs.

Description Use the **port trunk permit vlan** command to add a Trunk port to a specified VLAN, a selection of VLANs, or all VLANs.

Use the **undo port trunk permit vlan** command to remove the Trunk port from a specified VLAN, a selection of VLANs, or all VLANs.

The Trunk port can allow multiple VLANs to pass. Repetitive execution of the **port trunk permit vlan** command will yield a set of *vlan-id-list*, to which the Trunk port belongs.

Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group.

Refer to "Link Aggregation Configuration Commands" on page 473 for information about port groups.

Related command: **port link-type**.

Example # Add the Trunk port Ethernet 1/0 to VLAN 2, VLAN 4, and the range of VLANs from VLAN 50 to VLAN 100.

```
<Sysname> system-view
[Sysname] vlan all
Please wait... Done.
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port link-type trunk
[Sysname-Ethernet1/0] port trunk permit vlan 2 4 50 to 100
Please wait.......... Done.
```

port trunk pvid vlan

Syntax **port trunk pvid vlan** *vlan-id*

undo port trunk pvid

View Ethernet interface view, port group view

Parameter *vlan-id* : VLAN ID, in the range of 1 to 4,094

Description Use the **port trunk pvid vlan** command to configure the default VLAN ID for the Trunk port.

Use the **undo port trunk pvid** command to restore the default.

By default, the default VLAN on a Trunk port is VLAN 1.

Execution of the **undo vlan** command on a Trunk port to remove a default VLAN does not affect the default VLAN configurations. That is to say, a non-existent VLAN can still be the default VLAN.

Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group.

Refer to "Link Aggregation Configuration Commands" on page 473 for information about port groups.

You must configure the same default VLAN ID for the Trunk port of both the local device and remote device. Otherwise, the packets cannot be transmitted correctly.

Related command: **port link-type**.

Example # Configure the default VLAN ID for the Trunk port Ethernet 1/0 as 100.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port link-type trunk
[Sysname-Ethernet1/0] port trunk pvid vlan 100
```

41 VOICE VLAN CONFIGURATION COMMANDS

- *Voice VLAN automatic mode and secure mode are not supported on MSR 20 series routers.*
- *Voice VLAN automatic mode and secure mode are not supported on SIC-4FSW and DSIC-9FSW modules.*
- *Voice VLAN automatic mode and secure mode are supported on 16FSW and 24FSW modules.*

display voice vlan oui

Syntax **display voice vlan oui**

View Any view

Parameter None

Description Use the **display voice vlan oui** command to display the Organizationally Unique Identifier (OUI) address(es), the OUI address mask, and the descriptive string currently supported by system.

Related command: **voice vlan**, **voice vlan enable**.

As the first 24 bits of a MAC address (in binary format), an OUI address is a globally unique identifier assigned to a vendor by IEEE.

Example # Display the OUI address of a voice VLAN.

```
<Sysname> display voice vlan oui
Oui Address     Mask            Description
0001-e300-0000  ffff-ff00-0000  Siemens phone
0003-6b00-0000  ffff-ff00-0000  Cisco phone
0004-0d00-0000  ffff-ff00-0000  Avaya phone
00d0-1e00-0000  ffff-ff00-0000  Pingtel phone
0060-b900-0000  ffff-ff00-0000  Philips/NEC phone
00e0-7500-0000  ffff-ff00-0000  Polycom phone
00e0-bb00-0000  ffff-ff00-0000  3com phone
```

Table 113 Description on the fields of the display voice vlan oui command

Field	Description
Oui Address	OUI addresses that are allowed to pass
Mask	Mask of the OUI addresses that are allowed to pass

Table 113 Description on the fields of the display voice vlan oui command

Field	Description
Description	Description of the OUI addresses that are allowed to pass

display voice vlan state

Syntax **display voice vlan state**

View Any view

Parameter None

Description Use the **display voice vlan state** command to display the voice VLAN configuration.

Related command: **voice vlan enable**.

Example # Display the voice VLAN configurations.

```
<Sysname> display voice vlan state
Voice VLAN status: ENABLE
Voice VLAN ID: 2
Voice VLAN security mode: Security
Voice VLAN aging time: 1440 minutes
Voice VLAN enabled port and its mode:
PORT               MODE
--------------------------------
Ethernet1/2        MANUAL
Ethernet1/3        MANUAL
Ethernet1/4        MANUAL
Ethernet1/5        AUTO
```

Table 114 Description on the fields of the display voice vlan state command

Field	Description
Voice VLAN status	The current voice VLAN status, that is, whether it is enabled or disabled.
Voice VLAN ID	ID of a voice VLAN
Voice VLAN security mode	Security mode of a voice VLAN
Voice VLAN aging time	Aging time of a voice VLAN
Current voice vlan enabled port and its mode	The port that is currently enabled with the voice VLAN feature and its working mode
PORT	port ID
MODE	Voice VLAN working mode: manual or automatic.

voice vlan

Syntax **voice vlan** *vlan-id* **enable**

undo voice vlan enable

View System view

Parameter *vlan-id*: ID of the VLAN to be enabled with the voice VLAN feature, in the range of 2 to 4,094.

Description Use the **voice vlan** command to enable the voice VLAN feature globally.

Use the **undo voice vlan enable** command to disable the voice VLAN feature globally.

- At one particular moment, only one VLAN of a certain device can have the voice VLAN feature enabled.
- Ensure that a VLAN exists before enabling its voice VLAN feature and that it is not VLAN 1. Otherwise, the configurations will fail.
- If a VLAN to be deleted has the voice VLAN feature enabled, you need to disable the voice VLAN feature first before deleting the VLAN.

Related command: **display voice vlan state**.

Example # Enable the voice VLAN feature on VLAN 2(assuming that VLAN 2 already exists).

```
<Sysname> system-view
[Sysname] voice vlan 2 enable
```

voice vlan aging

Syntax **voice vlan aging** *minutes*

undo voice vlan aging

View System view

Parameter *minutes*: Aging time of a voice VLAN, in the range 5 to 43,200 minutes. This value is 1,440 by default.

Description Use the **voice vlan aging** command to configure the aging time of a voice VLAN.

Use the **undo voice vlan aging** command to restore the aging time of a voice VLAN.

Under automatic mode, the system will decide whether to add a port to a voice VLAN based on the source MAC address contained in its inbound voice packets. After adding a port to the voice VLAN, the system will start the aging timer at the same time. If within the aging time, no voice packets is received from the port, it will be removed from the voice VLAN when the aging time expires.

Related command: **display voice vlan state**.

Example # Configure the aging time of the voice VLAN as 100 minutes.

```
<Sysname> system-view
[Sysname] voice vlan aging 100
```

voice vlan enable

Syntax **voice vlan enable**

undo voice vlan enable

View Ethernet interface view

Parameter None

Description Use the **voice vlan enable** command to enable the voice VLAN feature on an Ethernet port.

Use the **undo voice vlan enable** command to disable the voice VLAN feature on an Ethernet port.

No voice VLAN is enabled on a port by default.

- Under automatic mode, only The Trunk or Hybrid port can be configured with the voice VLAN feature. The Access port cannot be configured with this feature.
- Before enabling the voice VLAN feature on a port, ensure that its is enabled globally first
- Only after the voice VLAN feature is enabled under both system view and Ethernet interface view will it functions properly.

Example # Enable the voice VLAN attribute on the port Ethernet 1/0.

```
<Sysname> system-view
[Sysname] voice vlan 2 enable
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] voice vlan enable
```

voice vlan mac-address

Syntax **voice vlan mac-address** *mac-addr* **mask** *oui-mask* [**description** *text*]

undo voice vlan mac-address *oui*

View System view

Parameter *mac-addr*: MAC address, in the format of H-H-H, such as 1234-1234-1234.

mask *oui-mask*: Valid length of the OUI address, represented in mask, in the format of H-H-H, from left to right are consecutive fs and 0s, for example, ffff-f000-0000.

description *text*: A case sensitive string that describes the OUI address, in the range of 1 to 30 characters.

oui: Deletes an OUI address that is in the format H-H-H, such as 1234-1200-0000, which is the logic AND result of *mac-addr* and *oui-mask.* Using the **display voice vlan oui** command can display OUI address information. The OUI address cannot be a broadcast, multicast or address of all 0s or all fs.

Description Use the **voice vlan mac-address** command to make a specified OUI address identified by the voice VLAN.

Use the **undo voice vlan mac-address** command to remove an OUI address from being identified by the voice VLAN.

A maximum of 16 OUI addresses can be supported by the system.

The system default OUI addresses, which can be removed or then added, are illustrated in the following table.

Table 115 Default OUI addresses

Number	OUI	Description
1	0001-e300-0000	Siemens phone
2	0003-6b00-0000	Cisco phone
3	0004-0d00-0000	Avaya phone
4	00d0-1e00-0000	Pingtel phone
5	0060-b900-0000	Philips/NEC phone
6	00e0-7500-0000	Polycom phone
7	00e0-bb00-0000	3com phone

Related command: **display voice vlan oui**.

Example # Configure the OUI address as 1234-1234-1234, the mask as ffff-ff00-0000, and the descriptive string as phone A, that is, voice packets from Phone A with source MAC address being 1234-1234-1234 can pass through the voice VLAN.

```
<Sysname> system-view
[Sysname] voice vlan mac-address 1234-1234-1234 mask ffff-ff00-0000
description PhoneA
```

Display OUI address information.

```
<Sysname> display voice vlan oui
Oui Address     Mask            Description
0001-e300-0000  ffff-ff00-0000  Siemens phone
0003-6b00-0000  ffff-ff00-0000  Cisco phone
0004-0d00-0000  ffff-ff00-0000  Avaya phone
00d0-1e00-0000  ffff-ff00-0000  Pingtel phone
0060-b900-0000  ffff-ff00-0000  Philips/NEC phone
```

```
00e0-7500-0000  ffff-ff00-0000  Polycom phone
00e0-bb00-0000  ffff-ff00-0000  3com phone
1234-1200-0000  ffff-ff00-0000  PhoneA
```

Disable voice packets of Phone A from passing through the voice VLAN.

```
<Sysname> system-view
[Sysname] undo voice vlan mac-address 1234-1200-0000
```

voice vlan mode auto

Syntax **voice vlan mode auto**

undo voice vlan mode auto

View Ethernet interface view

Parameter None

Description Use the **voice vlan mode auto** command to configure the voice VLAN working mode on a port to be automatic.

Use the **undo voice vlan mode auto** command to configure the voice VLAN working mode on a port to be manual.

By default, the voice VLAN working mode is automatic.

The voice VLAN working mode of a port is independent of those of other ports.

Note that: if a port is enabled with voice VLAN in manual mode, you need to add the port to the voice VLAN manually to validate the voice VLAN.

Example # Configure the voice VLAN working mode on Ethernet 1/0 as manual.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] undo voice vlan mode auto
```

voice vlan security enable

Syntax **voice vlan security enable**

undo voice vlan security enable

View System view

Parameter None

Description Use the **voice vlan security enable** command to enable the security mode for voice VLAN.

Use the **undo voice vlan security enable** command to disable the security mode for voice VLAN.

By default, the security mode of voice VLAN is enabled.

*The **voice vlan security enable** and **undo voice vlan security enable** commands take effect only after the voice VLAN attribute is enabled globally.*

Example # Disable the security mode of the voice VLAN.

```
<Sysname> system-view
[Sysname] undo voice vlan security enable
```

42 PORT ISOLATION CONFIGURATION COMMANDS

display port-isolate group

Syntax **display port-isolate group**

View Any view

Parameter None

Description Use the **display port-isolate group** command to display information of the default isolation group (Group 1).

Example # Display information of the default isolation group.

```
<Sysname> display port-isolate group
 Port-isolate group information:
 Uplink port support: NO
 Group ID: 1
    Ethernet1/1                Ethernet1/2
```

Table 116 Description on the output information of the display port-isolate group command

Field	Description
Port-isolate group information	Information of the isolation group
Uplink port support	Whether support uplink port
Group ID	Isolation group number
Ethernet1/1 Ethernet1/2	Ordinary ports (non-uplink ports) in the isolation group

port-isolate enable

Syntax **port-isolate enable**

undo port-isolate enable

View Ethernet interface view, port group view

Parameter None

Description Use the **port-isolate enable** command to add the current port to the default isolation group (Group 1) as an ordinary port.

Use the **undo port-isolate enable** command to remove the port from the isolation group.

Configured in Ethernet interface view, the setting is effective on the current port only; configured in port group view, the setting is effective on all ports in the port group.

Refer to "Link Aggregation Configuration Commands" on page 473 for information about port groups.

This command adds a port to the default isolation group 1.

Example # Add port Ethernet 1/0 to isolation group 1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] port-isolate enable
```

43 DYNAMIC ROUTE BACKUP CONFIGURATION COMMANDS

Refer to "DCC Configuration Commands" on page 315 for more information about dial control center (DCC).

standby routing-group

Syntax **standby routing-group** *group-number*

undo standby routing-group *group-number*

View Interface view

Parameter *group-number*: Dynamic route backup group number, ranging from 1 to 255.

Description Use the **standby routing-group** command to enable the dynamic route backup function on a dialup interface.

Use the **undo standby routing-group** command to disable the dynamic route backup function.

By default, the dynamic route backup function is disabled.

Before enabling the dynamic route backup function on a dialup interface, make sure that DCC has been enabled on the dialup interface.

Example # Enable the dynamic route backup function on Bri 3/0.

```
<Sysname> system-view
[Sysname] interface bri 3/0
[Sysname-Bri3/0] standby routing-group 1
```

standby routing-rule

Syntax **standby routing-rule** *group-number* **ip** *ip-address* { *mask* | *mask-length* }

undo standby routing-rule *group-number* [**ip** *ip-address* { *mask* | *mask-length* }]

View System view

Parameter *group-number*: Dynamic route backup group number, ranging from 1 to 255.

ip *ip-address*: IP address of the network segment to be monitored.

mask: Network mask.

mask-length: Network mask length, ranging from 0 to 32.

Description Use the **standby routing-rule** command to create a dynamic route backup group and add the network segment to be monitored to this group.

Use the **undo standby routing-rule** command to remove a dynamic route backup group or remove the monitored network segment from this group.

By default, no dynamic route backup group is created.

Up to 255 monitored network segments can be added to a dynamic route backup group. The primary link is considered to be disconnected when there is no valid route to any of the monitored network segments in a dynamic route backup group.

Example # Create dynamic route backup group 1 to monitor routes to the network segments 20.0.0.0/8 and 30.0.0.0/8.

```
<Sysname> system-view
[Sysname] standby routing-rule 1 ip 20.0.0.1 255.0.0.0
[Sysname] standby routing-rule 1 ip 30.0.0.1 255.0.0.0
```

standby timer routing-disable

Syntax **standby timer routing-disable** *seconds*

undo standby timer routing-disable

View Interface view

Parameter *seconds*: Delay between primary link connection and backup link disconnection, ranging from 0 to 65,535 in seconds.

Description Use the **standby timer routing-disable** command to configure the delay between primary link connection and backup link disconnection. .

Use the **undo standby timer routing-disable** command to restore the default.

By default, the delay between primary link connection and backup link disconnection is 20 seconds.

Example # Set the delay between primary link connection and backup link disconnection to 5 seconds on Bri 3/0.

```
<Sysname> system-view
[Sysname] interface bri 3/0
[Sysname-Bri3/0] standby timer routing-disable 5
```

44 LOGICAL INTERFACE CONFIGURATION COMMANDS

This section introduces basic configurations about logical interfaces. For the configurations about the data link layer, the network layer and some special features, refer to the relevant sections in Chapter 1 through Chapter 37 and Chapter 46 through Chapter 70.

broadcast-limit link

Syntax **broadcast-limit link** *number*

undo broadcast-limit link

View Virtual template (VT) view

Parameter *number*: Maximum number of links that can send multicast or broadcast packets in a VT. This argument ranges from 0 to 128 and defaults to 30. The value 0 indicates that multicast packets or broadcast packets cannot be sent.

Description Use the **broadcast-limit link** command to set the maximum number of links that can send multicast or broadcast packets in a VT. Use the **undo broadcast-limit link** command to restore the default setting.

When a VT has plenty of links, the system performance will be decreased if all the links send multicast or broadcast packets. In this case, you can use the **broadcast-limit link** command to limit the maximum number of links that can send multicast packets or broadcast packets.

Example # Set the maximum number of links that can send multicast or broadcast packets in VT 1 to 100.

```
<Sysname> system-view
[Sysname] interface virtual-template 1
[Sysname-Virtual-Template1] broadcast-limit link 100
```

display interface loopback

Syntax **display interface loopback** [*number*]

View Any view

Parameter *number*: Loopback interface number, which can be the number of any existing Loopback interface.

Description Use the **display interface loopback** command to view the relevant information about the existing Loopback interfaces. If you do not provide a Loopback interface number, this command will display the relevant information about all the existing Loopback interfaces.

Related command: **interface loopback**.

Example # View the status of Loopback 12.

```
<Sysname> display interface loopback 12
LoopBack12 current state: UP
Line protocol current state: UP (spoofing)
Description: LoopBack12 Interface
The Maximum Transmit Unit is 1536
Internet protocol processing : disabled
Physical is Loopback
    Last 300 seconds input:  0 bytes/sec 0 packets/sec
    Last 300 seconds output:  0 bytes/sec 0 packets/sec
    0 packets input, 0 bytes, 0 drops
0 packets output, 0 bytes, 0 drops
```

Table 117 Description on the fields of the display interface loopback command

Field	Description
current state	Physical state of the interface: UP/DOWN
Line protocol current state	State of the link layer protocol: UP/DOWN
Description	Description string of the interface
The Maximum Transmit Unit	Maximum transmit unit (MTU) of the interface
Internet protocol processing	Processing state of the network layer protocol: enabled/disabled
Physical	Physical type of the interface
Last 300 seconds input: 0 bytes/sec 0 packets/sec	Statistics on packets sent/received over the physical layer
Last 300 seconds output: 0 bytes/sec 0 packets/sec	
0 packets input, 0 bytes, 0 drops	
0 packets output, 0 bytes, 0 drops	

display interface mfr

Syntax **display interface mfr** [*mfr-number*]

View Any view

Parameter *mfr-number*: Multilink frame relay (MFR) interface number, which can be the number of any existing MFR interface.

Description Use the **display interface mfr** command to view the state information about the existing MFR interfaces. If you do not provide an MFR interface number, this command will display the state information about all the existing MFR interfaces.

Related command: **interface mfr**.

Example # View the state information about MFR 2.

```
<Sysname> display interface mfr 2
MFR2 current state: DOWN
Line protocol current state: DOWN
Description: MFR2 Interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)
Internet protocol processing : disabled
Link layer protocol is FR IETF
  LMI DLCI is 0, LMI type is Q.933a, frame relay DTE
  LMI status enquiry sent 0, LMI status received 0
  LMI status timeout 0, LMI message discarded 0
Physical is MFR
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards) 0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
    Last 300 seconds input:  0 bytes/sec, 0 packets/sec
    Last 300 seconds output:  0 bytes/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 drops
0 packets output, 0 bytes, 0 drops
```

Table 118 Description on the fields of the display interface mfr command

Field	Description
current state	Physical state of the interface: UP/DOWN
Line protocol current state	State of the link layer protocol: UP/DOWN
Description	Description string of the interface
The Maximum Transmit Unit	Maximum transmit unit (MTU) of the interface
Internet protocol processing	Processing state of the network layer protocol: enabled/disabled
Link layer protocol	Link layer protocol
LMI DLCI	Data link connection identifier (DLCI) used by the local management interface (LMI)
LMI type	Type of the LMI
frame relay	Type of the frame relay device
LMI status enquiry sent 0, LMI status received 0	Statistics on packets sent/received over the link layer
LMI status timeout 0, LMI message discarded 0	
Physical	Physical type of the interface

Table 118 Description on the fields of the display interface mfr command

Field	Description
Output queue : (Urgent queue : Size/Length/Discards)	Statistics on packets sent/received over the physical layer
Output queue : (Protocol queue : Size/Length/Discards)	
Output queue : (FIFO queuing : Size/Length/Discards)	
Last 300 seconds input: 0 bytes/sec, 0 packets/sec	
Last 300 seconds output: 0 bytes/sec, 0 packets/sec	
0 packets input, 0 bytes, 0 drops	
0 packets output, 0 bytes, 0 drops	

display interface mp-group

Syntax **display interface mp-group** [*mp-number*]

View Any view

Parameter *mp-number:* Multilink point to point protocol group (MP-group) interface number, which can be the number of any existing MP-group interface.

Description Use the **display interface mp-group** command to view the state information about the existing MP-group interfaces. If you do not provide an MP-group interface number, this command will display the state information about all the existing MP-group interfaces.

Related command: **interface mp-group**.

Example # View the state information of MP-group 12.

```
<Sysname> display interface mp-group 12
Mp-group12 current state: DOWN
Line protocol current state: DOWN
Description: Mp-group12 Interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)
Internet protocol processing : disabled
Link layer protocol is PPP
LCP initial
Physical is MP
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards) 0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
    Last 300 seconds input:  0 bytes/sec 0 packets/sec
    Last 300 seconds output:  0 bytes/sec 0 packets/sec
    0 packets input, 0 bytes, 0 drops
0 packets output, 0 bytes, 0 drops
```

The "Hold timer" field of the **display interface mp-group** command represents the hold time of the link state (up/down) of the current interface, and the "LCP initial" field indicates that the link control protocol (LCP) is initialized. Refer to Table 117 for the description on the other fields.

display interface null

Syntax **display interface** null [**0**]

View Any view

Parameter **0**: Null interface number. This argument is always 0.

Description Use the **display interface null** command to view the state information about the null interface. Even if this argument is not specified, the state information about null interface 0 is displayed, because there is only one interface.

Related command: **interface null**.

Example # View the state information about null 0.

```
<Sysname> display interface null 0
NULL0 current state :UP
Line protocol current state :UP (spoofing)
Description :  NULL0 Interface
The Maximum Transmit Unit is 1500
Internet protocol processing : disabled
Physical is NULL DEV
    Last 300 seconds input:  0 bytes/sec 0 packets/sec
    Last 300 seconds output:  0 bytes/sec 0 packets/sec
    0 packets input, 0 bytes, 0 drops
0 packets output, 0 bytes, 0 drops
```

Refer to Table 117 for the description on the fields of the **display interface null** command.

display interface virtual-ethernet

Syntax **display interface virtual-ethernet** [*number*]

View Any view

Parameter *number*: Virtual Ethernet (VE) interface number, which can be the number of any existing VE interface.

Description Use the **display interface virtual-ethernet** command to view the state information about the existing VE interfaces. If you do not provide a VE interface number, this command will display the state information about all the existing VE interfaces.

Related command: **interface virtual-ethernet**.

Example # View the state information about VE 12.

```
<Sysname> display interface virtual-ethernet 12
Virtual-Ethernet2 current state: UP
Line protocol current state: UP
Description: Virtual-Ethernet2 Interface
The Maximum Transmit Unit is 1500
Internet protocol processing : disabled
IP Packet Frame Type: PKTFMT_ETHNT_2,  Hardware Address: 000f-e200-1234
IPv6 Packet Frame Type: PKTFMT_ETHNT_2,  Hardware Address: 000f-e200-1234
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards)  0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
```

Table 119 Description on the fields of the display interface virtual-ethernet command

Field	Description
current state	Physical state of the interface: UP/DOWN
Line protocol current state	State of the link layer protocol: UP/DOWN
Description	Description string of the interface
The Maximum Transmit Unit	MTU of the interface
Internet protocol processing	Processing state of the network layer protocol: enabled/disabled
IP Packet Frame Type	Encapsulation format of IP packets
Hardware Address	Hardware address (MAC addresses)
IPv6 Packet Frame Type	Encapsulation format of IPv6 packets
Output queue : (Urgent queue : Size/Length/Discards)	Statistics on output queues
Output queue : (Protocol queue : Size/Length/Discards)	
Output queue : (FIFO queuing : Size/Length/Discards)	

display interface virtual-template

Syntax **display interface virtual-template** [*number*]

View Any view

Parameter *number*: VT number, which can be the number of any existing VT.

Description Use the **display interface virtual-template** command to view the state information about the existing VTs. If you do not provide a VT number, this command will display the state information about all the existing VTs.

Related command: **interface virtual-template**.

Example # View the state information about VT 1.

```
<Sysname> display interface virtual-template 1
Virtual-Template1 current state: UP
```

```
Line protocol current state: UP (spoofing)
Description: Virtual-Template1 Interface
The Maximum Transmit Unit is 1500, Hold timer is 10(sec)
Internet protocol processing : disabled
Link layer protocol is PPP
LCP initial
Physical is None
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards) 0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
    Last 300 seconds input:  0 bytes/sec 0 packets/sec
    Last 300 seconds output:  0 bytes/sec 0 packets/sec
    0 packets input, 0 bytes, 0 drops
0 packets output, 0 bytes, 0 drops
```

The "LCP initial" field of the **display interface virtual-template** command indicates that LCP is initialized. Refer to Table 117 for the description on the other fields.

display mfr

Syntax **display mfr** [**interface** *interface-type interface-number* | **verbose**]

View Any view

Parameter *interface-type interface-number*: Interface type and interface number.

verbose: Displays the detailed statistics.

Description Use the **display mfr** command to display the configuration information and statistics information about the MFR bundle and bundled links.

Example # Display the configuration information and state information about all the MFR bundles and bundled links.

```
<Sysname> display mfr
Bundle interface:MFR0, Bundle State = up, Bundle Class = A
    fragment disabled
    Bundle name = MFR0
    Bundle links:
Serial1/0, PHY state = up, link state = up, Link name = Serial1/0
```

Table 120 Description of the fields of the display mfr command

Field	Description
Bundle interface	Bundled interface
Bundle state	State of the bundled interface
Bundle class	If the bundle class is A, the state of the bundled interface is up only if one of the bundled links is up; when all the bundled links are down, the state of the bundled interface is shown as down.
fragment disabled	Whether fragmentation is enabled (in this example, fragmentation is disabled)

Table 120 Description of the fields of the display mfr command

Field	Description
Bundle name = MFR0	Name of the MFR bundling
Bundle links	Physical interface information on each bundled link
Serial1/0, PHY state = up, link state = up, Link name = Serial1/0	Physical interface of the bundled link, physical state of the interface, state of the link layer, and the name of the bundled link (name of the corresponding interface by default)

display virtual-access

Syntax **display virtual-access** [**dialer** *dialer-number* | **vt** *vt-number* | **user** *user-name* | **peer** *peer-address* | *va-number*]*

View Any view

Parameter *dialer-number*: Dialer interface number, ranging from 0 to 1023.

vt-number: Number of the VT where the virtual access (VA) interface resides. This argument ranges from 0 to 1023.

user-name: Name of the user accessing through the VA interface. This argument is a string of 1 character to 80 characters.

peer-address: Peer IP address of the VA interface, in dotted decimal notation.

va-number: Sequence number of the VA interface, ranging from 0 to 128.

Description Use the **display virtual-access** command to view the state information about the VA interfaces.

When necessary, the system will automatically create VA interfaces, which will adopt the parameters defined in a specific VT. You need not create and configure VA interfaces manually. VA interfaces will be removed due to underlying layer disconnection or user intervention.

Example # View the state information about all the VA interfaces.

```
<Sysname> display virtual-access vt 1
Virtual-Template1:0 current state :UP
Line protocol current state :UP
Description : Virtual-Template1:0 Interface
The Maximum Transmit Unit is 1500
Link layer protocol is PPP
LCP opened, MP opened, IPCP opened, OSICP opened
Physical is MP, baudrate: 64000
Output queue : (Urgent queue : Size/Length/Discards)  0/50/0
Output queue : (Protocol queue : Size/Length/Discards) 0/500/0
Output queue : (FIFO queuing : Size/Length/Discards)  0/75/0
    Last 300 seconds input:  0 bytes/sec 0 packets/sec
    Last 300 seconds output:  0 bytes/sec 0 packets/sec
```

```
    4 packets input, 50 bytes, 0 drops
4 packets output, 50 bytes, 0 drops
```

Refer to Table 117 for the description on the fields of the **display interface virtual-access** command.

interface

Syntax **interface** *interface-type interface-number.subnumber* [**p2mp** | **p2p**]

undo interface *interface-type interface-number.subnumber*

View System view

Parameter *interface-type interface-number.subnumber*: Interface type and interface number. The *interface-number* argument is the primary interface number, and the *subnumber* argument is the sub-interface number, ranging from 0 to 1023.

p2mp: Configures the type of a WAN sub-interface to be point-to-multipoint.

p2p: Configures the type of a WAN sub-interface to be point-to-point.

Description Use the **interface** *interface-type interface-number.subnumber* [**p2mp** | **p2p**] command to create a WAN sub-interface and enter WAN sub-interface view.

Use the **undo interface** command to remove the specified sub-interface.

Currently, point-to-multipoint or point-to-point sub-interfaces can be configured for ATM interfaces, frame relay interfaces or X.25 interfaces. By default, point-to-multipoint sub-interfaces are created.

A Layer 3 Ethernet interface can accommodate 1 to 4,096 sub-interfaces.

Example # Create a sub-interface on ATM 2/0.

```
<Sysname> system-view
[Sysname] interface atm 2/0.1
[Sysname-Atm2/0.1]
```

interface ethernet

Syntax **interface ethernet** *interface-number.subnumber*

undo interface ethernet *interface-number.subnumber*

View System view

Parameter *interface-number.subnumber*: Interface number. The *interface-number* argument is the primary interface number, and the *subnumber* argument is the sub-interface number, ranging from 1 to 4094.

Description Use the **interface ethernet** command to create an Ethernet sub-interface and enter the corresponding Ethernet sub-interface view.

Use the **undo interface ethernet** command to remove the specified Ethernet sub-interface.

By default, no VLAN is associated to an Ethernet sub-interface.

Note that the VLAN associated with the Ethernet sub-interface of the local device must be the same as the VLAN associated to the Ethernet sub-interface of the peer device. Otherwise, packets cannot be transmitted properly. A Layer 3 Ethernet interface can accommodate 1 to 4,096 sub-interfaces.

Example # Create a sub-interface on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0.1
[Sysname-Ethernet1/0.1]
```

interface loopback

Syntax **interface loopback** *number*

undo interface loopback *number*

View System view

Parameter *number*: Loopback interface number, ranging from 0 to 1023.

Description Use the **interface loopback** command to create a Loopback interface and enter the corresponding Loopback interface view.

Use the **undo interface loopback** command to remove the specified Loopback interface.

Related command: **display interface loopback**.

Example # Create Loopback 5.

```
<Sysname> system-view
[Sysname] interface loopback 5
[Sysname-LoopBack5]
```

interface mfr

Syntax **interface mfr** { *interface-number* | *interface-number.subnumber* }

undo interface mfr { *interface-number* | *interface-number.subnumber* }

View System view

Parameter *interface-number.subnumber*: Interface number. The *interface-number* argument is the primary interface number, and the *subnumber* argument is the sub-interface number, ranging from 0 to 1023.

Description Use the **interface mfr** command to create an MFR interface or an MFR sub-interface and enter the specified MFR interface view or MFR sub-interface view.

Use the **undo interface mfr** command to remove an MFR interface.

Create the corresponding MFR interface before creating an MFR sub-interface.

Example # Create MFR 3.

```
<Sysname> system-view
[Sysname] interface mfr 3
[Sysname-MFR3]
```

interface mp-group

Syntax **interface mp-group** *mp-number*

undo interface mp-group *mp-number*

View System view

Parameter *mp-number*: MP-group interface number, ranging from 0 to 1023.

Description Use the **interface mp-group** command to create an MP-group interface and enter the specified MP-group interface view.

Use the **undo interface mp-group** command to remove an MP-group interface.

This command can be used in conjunction with the **ppp mp mp-group** command. You can execute the two commands regardless of sequence.

Example # Create MP-group 3.

```
<Sysname> system-view
[Sysname] interface mp-group 3
[Sysname-Mp-group3]
```

interface null

Syntax **interface null 0**

View System view

Parameter **0**: Specifies the null interface number.

Description Use the **interface null** command to enter null interface view.

Only one null interface (Null 0) exists. Null 0 is always up, and cannot be brought down or removed.

Related command: **display interface null**.

Example # Enter Null 0 interface view.

```
<Sysname> system-view
[Sysname] interface null 0
[Sysname-NULL0]
```

interface virtual-ethernet

Syntax **interface virtual-ethernet** *number*

undo interface virtual-ethernet *number*

View System view

Parameter *number*: VE interface number, ranging from 0 to 1023.

Description Use the **interface virtual-ethernet** command to create a VE interface and enter the specified VE interface view.

Use the **undo interface virtual-ethernet** command to remove the specified VE interface.

Example # Create VE interface 12.

```
<Sysname> system-view
[Sysname] interface virtual-ethernet 12
[Sysname-Virtual-Ethernet12]
```

interface virtual-template

Syntax **interface virtual-template** *number*

undo interface virtual-template *number*

View System view

Parameter *number*: VT number, ranging from 0 to 1023.

Description Use the **interface virtual-template** command to create a VT and enter the specified VT view.

Use the **undo interface virtual-template** command to remove the specified VT.

Before removing a VT, make sure that all the relevant VA interfaces are removed and this virtual interface is not being used.

Example # Create VT 10.

```
<Sysname> system-view
[Sysname] interface virtual-template 10
[Sysname-Virtual-Template10]
```

45 CPOS INTERFACE CONFIGURATION COMMANDS

E1- and T1-related commands are available for the CPOS (E) interface modules only.

clock

Syntax **clock** { **master** | **slave** }

undo clock

View CPOS interface view

Parameter **master**: Sets the clock mode of the CPOS interface to master.

slave: Sets the clock mode of the CPOS interface to slave.

Description Use the **clock** command to set the clock mode of the CPOS interface.

Use the **undo clock** command to restore the default, that is, slave.

When connected to a SONET/SDH device, the CPOS interface must use the slave clock because the SONET/SDH network clock is more precise. When the interface is directly connected to another CPOS interface with fiber-optic, you only need to configure them with different clock modes.

Example # Set the clock mode of interface CPOS 1/0 to master.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] clock master
```

controller cpos

Syntax **controller cpos** *cpos-number*

View System view

Parameter *cpos-number*: CPOS interface number.

Description Use the **controller cpos** command to enter CPOS interface view.

Before you can configure a CPOS physical interface, you must enter its CPOS interface view.

Example # Enter the interface view of CPOS 1/0.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0]
```

---

crc

Syntax **crc** { **16** | **32** | **none** }

undo crc

View Synchronizing serial interface view

Parameter **16**: Sets the length of the CRC word to 16 bits.

32: Sets the length of the CRC word to 32 bits.

None: Disables CRC.

Description Use the **crc** command to set the CRC word length for a synchronizing serial interface formed by CPOS interfaces.

Use the **undo crc** command to restore the default.

The CRC word length for a synchronizing serial interface formed by CPOS interfaces defaults to 16 bits.

Example # Set the CRC word length to 16 bits for CPOS interface 1/0.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] e1 3 channel-set 1 timeslot-list 1-31
[Sysname-Cpos1/0] quit
[Sysname] interface serial 1/0/3:1
[Sysname-Serial1/0/3:1] crc 16
```

---

display controller cpos

Syntax **display controller cpos** [*cpos-number*]

View Any view

Parameter *cpos-number*: CPOS interface number. If no CPOS number is specified, the information about all CPOS interfaces is displayed.

Description Use the **display controller cpos** command to display information about CPOS interfaces, such as state of E1/T1 channels, and alarms, and errors occurred to the regeneration section, multiplex section, and higher-order path.

The following table lists possible error types in the displayed information:

Table 121 Possible error types

Field	Description
FRED	Receive loss of basic frame alignment, or receive frames with red alarm errors.
COFA	Change of frame alignment.
SEF	Severely error frame. Four consecutive frame synchronization errors generate one SEF.
FERR	Framing Bit Error. It refers to the frame with the Ft/FPS/FAS error.
CERR	CRC error
FEBE	Far end block error. This occurs when the CRC4 framing format applies on the E1 channel.
BERR	PRBS bit error (Pseudo-random binary sequence bit error, for test only).
BIP	Bit-interleaved parity.
REI	Remote error indication.

In this table, FRED, COFA, and SEF are alarm errors (AERRs).

Related command: **display controller cpos e1**, **display controller cpos t1**.

Example # Display the path information of interface CPOS 4/0.

```
<Sysname> display controller cpos 4/0
Cpos4/0 current state : UP
Description : Cpos4/0 Interface
  Frame-format SDH, multiplex AU-3, clock master, loopback not set
  Tx: J0: 0x01, J1: "NetEngine", C2: 0x02
  Rx: J0: 0x01, J1: "NetEngine", C2: 0x02
Regenerator section:
  Alarm: none
  Error: 0 BIP, 0 SEF
Multiplex section:
  Alarm: none
  Error: 0 BIP, 0 REI
Higher order path(VC-3-1):
  Alarm: none
  Error: 0 BIP, 0 REI
Higher order path(VC-3-2):
  Alarm: none
  Error: 0 BIP, 0 REI
Higher order path(VC-3-3):
  Alarm: none
  Error: 0 BIP, 0 REI
Cpos4/0  CT1 1  is up
  Frame-format ESF, clock master, loopback not set
Cpos4/0  CT1 2  is up
  Frame-format ESF, clock master, loopback not set
```

```
Cpos4/0  CT1 3  is up
  Frame-format ESF, clock master, loopback not set
```

(Some information about T1 channels is omitted.)

```
Cpos4/0  CT1 83  is up
  Frame-format ESF, clock master, loopback not set
Cpos4/0  CT1 84  is up
  Frame-format ESF, clock master, loopback not set
```

Table 122 Description on the fields of the display controller cpos command

Field	Description
Cpos4/0 current state	Current physical state of the CPOS interface.
Description	Interface description.
Frame-format SDH, multiplex AU-3, clock master, loopback not set	Physical layer information of the CPOS interface: the framing format is set to SDH, AU-3 path is adopted, master clock (internal clock signal) is used, and loopback is disabled.
Tx: J0: 0x01, J1: "NetEngine", C2: 0x02	The sent overhead bytes.
Rx: J0: 0x01, J1: "NetEngine", C2: 0x02	The received overhead bytes.
Regenerator section:	Alarm and error statistics about the regeneration section.
Multiplex section:	Alarm and error statistics about the multiplex section.
Higher order path(VC-3-x):	Alarm and error statistics about the higher-order path. The x in "VC-3-x" indicates the path number. When adopting AU-3 path, one STM-1 has three higher-order paths because it is multiplexed by three VC-3s. In the AU-4 path, there is one higher-order path VC-4.
Alarm:	Alarm statistics.
Error:	Error statistics.
Cpos4/0 CT1 1 is up	The current physical state of T1 channel 1 of the CPOS interface 4/0.
Frame-format ESF, clock master, loopback not set	Physical layer information of T1 channels: the framing format is set to ESF, master clock (internal clock signal) is used, and loopback is disabled.

display controller cpos e1

Syntax **display controller cpos** *cpos-number* **e1** *e1-number*

View Any view

Parameter *cpos-number*: CPOS interface number.

e1-number: Number of an E1 channel on a CPOS interface, in the range 1 to 63.

Description Use the **display controller cpos e1** command to display the physical layer configuration information of the specified E1 channel on the specified CPOS interface.

Different from the **display controller cpos** command, this command can display the error and alarm information of lower-order paths and E1 frames.

Example # Display the status information of E1 channel 1 on interface CPOS 1/0.

```
<Sysname> display controller cpos 1/0 e1 1
Cpos1/0 current state : UP
Description : Cpos1/0 Interface
  Frame-format SDH, multiplex AU-4, clock master, loopback not set
  Tx: J0: 0x01, J1: "NetEngine", C2: 0x02
  Rx: J0: 0x01, J1: "NetEngine", C2: 0x02

Regenerator section:
  Alarm: none
  Error: 0 BIP, 0 SEF

Multiplex section:
  Alarm: none
  Error: 0 BIP, 0 REI

Higher order path(VC-4-1):
  Alarm: none
  Error: 0 BIP, 0 REI

Lower order path:
  Alarm: none
  Error: 0 BIP, 0 REI

Cpos2/0  CE1 1 is up
  Frame-format NO-CRC4, clock slave, loopback not set

E1 framer(1-1-1-1):
  Alarm: none
  Error: 0 FERR, 0 FEBE, 0 AERR
```

In the output, "E1 framer(1-1-1-1)" presents how the E1 channel is multiplexed. 1-1-1-1 represents in order VC-4 number, TUG-3 number, TUG-2 number, and TUG-12 number for an E1 channel.

display controller cpos t1

Syntax **display controller cpos** *cpos-number* **t1** *t1-number*

View Any view

Parameter *cpos-number*: CPOS interface number.

t1-number: Number of a T1 channel on a CPOS interface, in the range 1 to 84.

Description Use the **display controller cpos t1** command to display the physical layer configuration information of a T1 channel on a CPOS interface.

Different from the **display controller cpos** command, this command can display the error and alarm information of lower-order paths and T1 frames.

Example # Display the status information of T1 channel 2 on interface CPOS 4/0.

```
<Sysname> display controller cpos 4/0 t1 2
Cpos4/0 current state : UP   Frame-format SDH, multiplex AU-3, clock
 master, loopback not set
  Tx: J0: 0x01, J1: "NetEngine", C2: 0x02
  Rx: J0: 0x01, J1: "NetEngine", C2: 0x02
Regenerator section:
  Alarm: none
  Error: 0 BIP, 0 SEF
Multiplex section:
  Alarm: none
  Error: 0 BIP, 0 REI
Higher order path(VC-3-2):
  Alarm: none
  Error: 0 BIP, 0 REI
Lower order path:
  Alarm: none
  Error: 4095 BIP, 2047 REI
Cpos4/0  CT1 2 is up
  Frame-format ESF, clock master, loopback not set
T1 framer(2-1-1):
  Alarm: none
  Error: 4095 FERR, 79 AERR
```

Table 123 Description on the fields of the display controller cpos t1 command

Field	Description
Cpos4/0 current state	The current physical state of the CPOS interface
Frame-format SDH, multiplex AU-3, clock master, loopback not set	Physical layer information of the CPOS interface: the framing format is set to SDH, AU-3 path is adopted, master clock (internal clock signal) is used, and loopback is disabled.
Tx: J0: 0x01, J1: “NetEngine”, C2: 0x02	The sent overhead bytes.
Rx: J0: 0x01, J1: “NetEngine”, C2: 0x02	The received overhead bytes.
Regenerator section	Alarms and errors about the regeneration section.
Multiplex section	Alarms and errors about the regeneration section.
Higher order path(VC-3-2)	Alarm and error statistics about the higher-order path to which the T1 channel belongs. VC-3-2 means the second VC-3.
Lower order path	Alarm and error statistics about the lower-order path.
Error	Error statistics.
Cpos4/0 CT1 2 is up	The current physical state of T1 channel 2 on interface CPOS 4/0.
Frame-format ESF, clock master, loopback not set	Information about the physical layer of the T1 channel: the framing format is set to ESF, master clock (internal clock signal) is used, loopback is disabled.

Table 123 Description on the fields of the display controller cpos t1 command

Field	Description
T1 framer(2-1-1):	Presents how the T1 channel is multiplexed. 2-1-1 represents in order VC-3 number, TUG-2 number, and TUG-11 number for the T1 channel. For its calculation principle, refer to the accompanied operation manual.

e1 channel-set

Syntax **e1** *e1-number* **channel-set** *set-number* **timeslot-list** *range*

undo e1 *e1-number* **channel-set** *set-number*

View CPOS interface view

Parameter *e1-number*: Number of an E1 channel on the CPOS interface, in the range 1 to 63.

set-number: Channel set number, in the range 0 to 30.

timeslot-list *range*: Specifies a list of timeslots assigned to the channel set. The *range* argument is in the range 1 to 31. While specifying timeslots, you can specify a single timeslot in the form of a *number*, or timeslots in a range in the form of *number1-number2*, or multiple timeslots in the form of *number1, number2-number3*.

Description Use the **e1 channel-set** command to bundle multiple timeslots on an E1 channel into one channel set.

Use the **undo e1 channel-set** command to remove the channel set (also mentioned as a bundle throughout this document).

By default, timeslot bundling is disabled on E1 channels.

When the E1 channel is channelized, its timeslot 0 is used for synchronization and the other 31 timeslots can be bundled to form one or multiple serial interfaces. These serial interfaces are numbered in the form of *interface number***/***channel number***:***channel set number*.

To guarantee the processing capacity of the system, you can have only up to 256 virtual serial interfaces on one CPOS physical interface.

Related command: **e1 unframed**.

Example # Bundle timeslots on E1 channel 63.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] e1 63 channel-set 1 timeslot-list 1-31
```

Enter the view of the serial interface formed by the timeslot bundle.

```
[Sysname-Cpos1/0] quit
[Sysname] interface serial 1/0/63:1
[Sysname-Serial1/0/63:1]
```

e1 set clock

Syntax **e1** *e1-number* **set clock** { **master** | **slave** }

undo e1 *e1-number* **set clock**

View CPOS interface view

Parameter *e1-number*: Number of an E1 channel on the CPOS interface, in the range 1 to 63.

master: Sets the clock mode of the E1 channel to master.

slave: Sets the clock mode of the E1 channel to slave.

Description Use the **e1 set clock** command to set the clock mode of the E1 channel.

Use the **undo e1 set clock** command to restore the default, that is, slave.

E1 channels on the same CPOS physical interface can use different clock modes, depending on connected devices. For example, when connected to a SONET/SDH device, an E1 channel should use the slave clock mode, and when directly connected to another device with fiber-optic, it can use either mode so long as the mode is different from the one used at the opposite end.

Note that different E1 channels of the same CPOS physical interface are independent of one another in terms of clock mode.

Example # Set the clock mode of E1 channel 1 to master.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] e1 1 set clock master
```

e1 set frame-format

Syntax **e1** *e1-number* **set frame-format** { **crc4** | **no-crc4** }

undo e1 *e1-number* **set frame-format**

View CPOS interface view

Parameter *e1-number*: Number of an E1 channel on the CPOS interface, in the range 1 to 63.

crc4: Sets the framing format to CRC4.

no-crc4: Sets the framing format to no-CRC4.

Description Use the **e1 set frame-format** command to set the framing format of an E1 channel.

Use the **undo e1 set frame-format** command to restore the default, that is, no-CRC4.

Example # Set E1 channel 1 to use framing format CRC4.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] e1 1 set frame-format crc4
```

e1 set loopback

Syntax **e1** *e1-number* **set loopback** { **local** | **payload** | **remote** }

undo e1 *e1-number* **set loopback**

View CPOS interface view

Parameter *e1-number*: Number of an E1 channel on the CPOS interface, in the range 1 to 63.

local: Enables internal loopback on the E1 channel.

payload: Enables external payload loopback on the E1 channel.

remote: Enables external loopback on the E1 channel.

Description Use the **e1 set loopback** command to configure the loopback mode of the E1 channel.

Use the **undo e1 set loopback** command to remove a loopback.

By default, loopback is disabled.

You may test E1 channels in different depths by using the **loopback** command with different keywords.

In an internal loopback, data of the sender is directly looped to the receiver.

In an external payload loopback, data received by the receiver is looped back at the E1 framer as payload.

In an external loopback, data received by the receiver is looped back directly without passing through the E1 framer.

Related command: **display controller cpos e1**.

Example # Enable external payload loopback on E1 channel 1.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] e1 1 set loopback payload
```

e1 shutdown

Syntax **e1** *e1-number* **shutdown**

undo e1 *e1-number* **shutdown**

View CPOS interface view

Parameter *e1-number*: Number of an E1 channel on the CPOS interface, in the range 1 to 63.

Description Use the **e1 shutdown** command to shut down an E1 channel.

Use the **undo e1 shutdown** command to bring up an E1 channel.

By default, E1 channels are enabled.

Disabling an E1 channel also disables the serial interfaces that are formed on it, if there is any.

Example # Shut down E1 channel 1.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] e1 1 shutdown
```

e1 unframed

Syntax **e1** *e1-number* **unframed**

undo e1 *e1-number* **unframed**

View CPOS interface view

Parameter *e1-number*: Number of an E1 channel on the CPOS interface, in the range 1 to 63.

Description Use the **e1 unframed** command to set an E1 channel on the CPOS interface to operate in unframed mode, that is, E1 mode.

Use the **undo e1 unframed** command to restore the default, that is, channelized mode.

So far, E1 channels on CPOS interfaces support two operating modes: clear channel (or unframed) and channelized.

- In unframed mode, an E1 channel can form a 2.048 Mbps serial interface without timeslot division. It is named **serial** *slot/port/e1-number***:0**.
- In channelized mode, all timeslots except timeslot 0 on the E1 channel can be bundled arbitrarily to form serial interfaces. Considering the system processing

capability, only up to 256 serial interfaces are allowed on one CPOS physical interface.

Example # Set E1 channel 3 on interface CPOS 1/0 to operate in unframed mode.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos 1/0] e1 3 unframed
```

flag

Syntax **flag** { **j0** *j0-string* | **j1** *j1-string* | **c2** *c2-value* }

undo flag { **j0** | **j1** | **c2** }

View CPOS interface view

Parameter **j0** *j0-string*: Specifies the regeneration section trace message. The *j0-string* argument is a string of 1 to 15 characters. The system default is 0x01.

j1 *j1-string*: Specifies the path trace message. The *j1-string* argument is a string of 1 to 15 characters. The system default is NetEngine.

c2 *c2-value*: Specifies the path signal label byte. The *c2-value* argument is a hexadecimal number in the range 0 to FF. The system default is 0x02.

Description Use the **flag** command to set the overhead byte of SONET/SDH frames.

Use the **undo flag** command to restore the default.

SONET/SDH frames provide a variety of overhead bytes for operation and maintenance (OAM) such as layered management on transmission networks. j1, j0 and c2 are used to support interoperability between devices in different countries and areas or from different vendors.

Related command: **display controller cpos**.

Example # Set J1 to aa on interface CPOS 1/0.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] flag j1 aa
```

frame-format

Syntax **frame-format** { **sdh** | **sonet** }

undo frame-format

View CPOS interface view

Parameter **sdh**: Sets framing format to synchronous digital hierarchy (SDH).

sonet: Sets framing format to synchronous optical network (SONET).

Description Use the **frame-format** command to configure framing on the CPOS interface.

Use the **undo frame-format** command to restore the default, that is, SDH.

Example # Set the framing format on interface CPOS 1/0 to SONET.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] frame-format sonet
```

loopback

Syntax **loopback** { **local** | **remote** }

undo loopback

View CPOS interface view

Parameter **local**: Internal loopback, used for testing the physical interface itself.

remote: External loopback, used for testing the cable connected to the interface.

Description Use the **loopback** command to configure the loopback mode on the CPOS interface.

Use the **undo loopback** command to remove a loopback.

By default, loopback is disabled.

Loopback is intended for test use. Disable it otherwise.

Example # Enable external loopback on interface CPOS 1/0.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] loopback remote
```

multiplex mode

Syntax **multiplex mode** { **au-3** | **au-4** }

undo multiplex mode

View CPOS interface view

Parameter **au-3**: Gets AUG through AU-3.

au-4: Gets AUG through AU-4.

Description Use the **multiplex mode** command to set AUG multiplexing mode.

Use the **undo multiplex mode** command to restore the default, that is, **au-4**.

SDH provides two payload mapping/multiplexing solutions: ANSI and ETSI.

- ANSI uses the AU-3 multiplexing scheme, where the lower-order payload is aggregated into the VC-3 higher-order path. VC-3 plus an AU pointer forms AU-3. Three such AU-3s can be synchronized and multiplexed to form one AUG.
- ETSI uses the AU-4 multiplexing scheme, where the lower-order payload is aggregated into the VC-4 higher-order path. VC-4 plus an AU pointer forms an AU-4. This AU-4 can be synchronized and multiplexed to form one AUG.

When the CPOS interface is operating in SDH mode, you can choose to multiplex AUG to AU-4 or AU-3 by using the **multiplex mode** command. When the CPOS interface is operating in SONET mode, AUG can be multiplexed only to AU-3 and the **multiplex mode** command is invalid in this case.

Related command: **frame-format**.

Example # In SDH mode, multiplex AUG to AU-3.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] frame-format sdh
[Sysname-Cpos1/0] multiplex mode au-
```

shutdown

Syntax **shutdown**

undo shutdown

View CPOS interface view

Parameter None

Description Use the **shutdown** command to shut down the CPOS physical interface.

Use the **undo shutdown** command to bring up the CPOS physical interface.

By default, the CPOS physical interface is up.

The **shutdown** command on the CPOS physical interface shuts down all E1/T1 channels and serial interfaces formed by timeslot bundles. They stop transmitting and receiving data as a result. To bring up them, perform the **undo shutdown** command on the CPOS physical interface.

Example # Shut down CPOS physical interface 1/0.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] shutdown
```

t1 channel-set

Syntax **t1** *t1-number* **channel-set** *set-number* **timeslot-list** *range* [**speed** { **56k** | **64k** }]

undo t1 *t1-number* **channel-set** *set-number*

View CPOS interface view

Parameter *t1-number*: Number of a T1 channel on the CPOS interface, in the range 1 to 84.

set-number: Channel set number in the range 0 to 23.

timeslot-list *range*: Specifies a list of timeslots assigned to the channel set. The *range* argument is in the range of 1 to 24. While specifying timeslots, you can specify a single timeslot in the form of a *number*, or timeslots in a range in the form of *number1-number2*, or multiple timeslots in the form of *number1, number2-number3*.

speed { **56k** | **64k** }: Specifies how timeslots are bundled. If the **56k** keyword applies, timeslots form an N × 56 kbps bundle. If **64k** applies, timeslots form an N × 64 kbps bundle. If the speed is not specified, the default 64 kbps applies.

Description Use the **t1 channel-set** command to bundle timeslots on the T1 channel.

Use the **undo t1 channel-set** command to remove the bundle.

By default, timeslot bundling is disabled on T1 channels.

The serial interface formed by a timeslot bundle is numbered in the form of *interface number*/*channel number*:*channel set number*.

Related command: **t1 unframed**.

Example # Bundle timeslots on T1 channel 1.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] t1 1 channel-set 1 timeslot-list 1-23
```

Enter the serial interface view after the bundling operation.

```
[Sysname-Cpos1/0] quit
[Sysname] interface serial 1/0/1:1
[Sysname-Serial1/0/1:1]
```

t1 set clock

Syntax **t1** *t1-number* **set clock** { **master** | **slave** }

undo t1 *t1-number* **set clock**

View CPOS interface view

Parameter *t1-number*: Number of a T1 channel on the CPOS, in the range 1 to 84.

Master: Set the clock mode of the T1 channel to master.

slave: Set the clock mode of the T1 channel to slave.

Description Use the **t1 set clock** command to configure the clock mode of the T1 channel.

Use the **undo t1 set clock** command to restore the default, that is, slave.

T1 channels on the same CPOS physical interface can use different clock modes, depending on connected devices. For example, when connected to a SONET/SDH device, a T1 channel should use the slave clock mode, and when directly connected to another device with fiber-optic, it can use either mode so long as the mode is different from the one used at the opposite end.

Note that different T1 channels of the same CPOS physical interface are independent of one another in terms of clock mode.

Example # Set the clock mode of T1 channel 1 to master.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] t1 1 set clock master
```

t1 set frame-format

Syntax **t1** *t1-number* **set frame-format** { **esf** | **sf** }

undo t1 *t1-number* **set frame-format**

View CPOS interface view

Parameter *t1-number*: Number of a T1 channel on the CPOS interface, in the range 1 to 84.

esf: Sets the T1 channel to use the extended super frame (ESF) format.

sf: Sets the T1 channel to use the super frame (SF) format.

Description Use the **t1 set frame-format** command to set the framing format for T1 channel.

Use the **undo t1 set frame-format** command to restore the default, that is, ESF.

Example # Set the framing format of T1 channel 1 to SF.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] t1 1 set frame-format sf
```

t1 set loopback

Syntax **t1** *t1-number* **set loopback** { **local** | **payload** | **remote** }

undo t1 *t1-number* **set loopback**

View CPOS interface view

Parameter *t1-number*: Number of a T1 channel on the CPOS interface, in the range 1 to 84.

local: Enables internal loopback.

payload: Enables external payload loopback.

remote: Enables external loopback.

Description Use the **t1 set loopback** command to configure the loopback mode of the T1 channel.

Use the **undo t1 set loopback** command to remove a loopback.

By default, loopback is disabled.

Loopback is intended for test use. Disable it otherwise.

Related command: **display controller cpos t1**.

Example # Enable external loopback on T1 channel 1.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] t1 1 set loopback payload
```

t1 shutdown

Syntax **t1** *t1-number* **shutdown**

undo t1 *t1-number* **shutdown**

View CPOS interface view

Parameter *t1-number*: Number of a T1 channel on the CPOS interface, in the range 1 to 84.

Description Use the **t1 shutdown** command to shut down a T1 channel.

Use the **undo t1 shutdown** command to bring up a T1 channel.

By default, T1 channels are enabled.

Disabling a T1 channel disables the serial interfaces formed on it, if there is any.

Example # Shut down T1 channel 1.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos1/0] t1 1 shutdown
```

t1 unframed

Syntax **t1** *t1-number* **unframed**

undo t1 *t1-number* **unframed**

View CPOS interface view

Parameter *t1-number*: Number of a T1 channel on the CPOS interface, in the range 1 to 84.

Description Use the **t1 unframed** command to set a T1 channel on the CPOS interface to operate in unframed mode.

Use the **undo t1 unframed** command to restore the default, that is, channelized mode.

Like E1 channels, T1 channels on CPOS interfaces support unframed (clear channel) mode and channelized mode.

- In unframed mode, a T1 channel can form a 1.544 Mbps serial interface without timeslot division. This interface is named **serial** *slot/card/t1-number*:0.
- In channelized mode, 24 timeslots of T1 channel can be bound and used as serial interfaces.

Example # Set T1 channel 3 on interface CPOS 1/0 to operate in unframed mode.

```
<Sysname> system-view
[Sysname] controller cpos 1/0
[Sysname-Cpos 1/0] t1 3 unframed
```

46 ARP CONFIGURATION COMMANDS

arp check enable

Syntax **arp check enable**

undo arp check enable

View System view

Parameter None

Description Use the **arp check enable** command to enable ARP entry check, preventing the device from learning multicast MAC addresses. With this function enabled, the device cannot learn any ARP entry with a multicast MAC address. Configuring such a static ARP entry is not allowed either; otherwise, the system prompts error information.

Use the **undo arp check enable** command to disable the function, allowing the device to learn multicast MAC addresses. After the ARP entry check is disabled, the device can learn the ARP entry with a multicast MAC address, and you can also configure such a static ARP entry on the device.

By default, ARP entry check is enabled.

Example # Enable ARP entry check.

```
<Sysname> system-view
[Sysname] arp check enable
```

arp max-learning-num

Syntax **arp max-learning-num** *number*

undo arp max-learning-num

View VLAN interface view

Parameter *number*: Maximum number of dynamic ARP entries learned on an interface, in the range of 1 to 4,096. The default value is 1,024.

Description Use the **arp max-learning-num** command to set the maximum number of dynamic ARP entries that an interface can learn.

Use the **undo arp max-learning-num** command to restore the default.

Example # Set the maximum number of dynamic ARP entries that can be learned on VLAN-interface 40 to 500.

```
<Sysname> system-view
[Sysname] interface vlan-interface 40
[Sysname-Vlan-interface40]arp max-learning-num 500
```

arp static

Syntax **arp static** *ip-address mac-address* [*vlan-id interface-type interface-number*] [**vpn-instance** *vpn-instance-name*]

undo arp *ip-address* [**vpn-instance** *vpn-instance-name*]

View System view

Parameter *ip-address*: IP address in an ARP entry.

mac-address: MAC address in an ARP entry, in the format H-H-H.

vlan-id: ID of a VLAN to which a static ARP entry belongs to, in the range 1 to 4094.

interface-type interface-number: Interface type and interface number.

vpn-instance *vpn-instance-name*: Name of a VLAN instance, a case-sensitive string of 1 to 31 characters.

Description Use the **arp static** command to configure a static ARP entry in the ARP mapping table.

Use the **undo arp** command to remove an ARP entry.

Note that:

- A static ARP entry is effective when the device works normally. However, when the VLAN or VLAN interface to which an ARP entry corresponds is deleted, the entry, if permanent, will be deleted, and if non-permanent and resolved, will become unresolved.
- The *vlan-id* argument is used to specify the corresponding VLAN of an ARP entry and must be the ID of an existing VLAN. In addition, the Ethernet interfaces following the argument must belong to that VLAN. The VLAN interface of the VLAN must have been created.
- Before using the command with the **vpn-instance keyword** to configure a permanent static ARP entry, you need to create a VPN instance and bind it to the VLAN interface.

Related command: **reset arp**, **display arp**.

Example # Configure a static ARP entry, with the IP address being 202.38.10.2, the MAC address being 00e0-fc01-0000, and the outbound interface being Ethernet 1/0 of VLAN 10.

```
<Sysname> system-view
[Sysname] arp static 202.38.10.2 00e0-fc01-0000 10 ethernet 1/0
```

arp timer aging

Syntax **arp timer aging** *aging-time*

undo arp timer aging

View System view

Parameter *aging-time*: Aging time for dynamic ARP entries in minutes, in the range 1 to 1,440.

Description Use the **arp timer aging** command to set aging time for dynamic ARP entries.

Use the **undo arp timer aging** command to restore the default.

By default, the aging time for dynamic ARP entries is 20 minutes.

Related command: **display arp timer aging**.

Example # Set aging time for dynamic ARP entries to 10 minutes.

```
<Sysname> system-view
[Sysname] arp timer aging 10
```

display arp

Syntax **display arp** { { **all** | **dynamic** | **static** } | **vlan** *vlan-id* | **interface** *interface-type interface-number* } [[**verbose**] [| { **begin** | **exclude** | **include** } *string*] | **count**]

View Any view

Parameter **all**: Displays all ARP entries.

dynamic: Displays dynamic ARP entries.

static: Displays static ARP entries.

vlan *vlan-id*: Displays the ARP entries of the specified VLAN. The VLAN ID ranges from 1 to 4094.

interface *interface-type interface-number*: Displays the ARP entries of the interface specified by the argument *interface-type interface-number*.

verbose: Displays detailed information about ARP entries.

|: Uses a regular expression to specify the ARP entries to be displayed.

begin: Displays ARP entries from the first one containing the specified string.

exclude: Displays the ARP entries that do not contain the specified string.

include: Displays the ARP entries containing the specified string.

string: A case-sensitive string for matching, consisting of 1 to 256 characters.

count: Displays the number of ARP entries.

Description Use the **display arp** command to display ARP entries in the ARP mapping table.

Related command: **arp static**, **reset arp**.

Example # Display the detailed information of all ARP entries.

```
<Sysname> display arp all verbose
                Type: S-Static    D-Dynamic
IP Address       MAC Address     VLAN ID  Interface              Aging Type
Vpn-instance Name
20.1.1.1         00e0-fc00-0001  N/A      N/A                    N/A   S
test
193.1.1.70       00e0-fe50-6503  100      GE1/0                14    D
[No Vrf]
192.168.0.115    000d-88f7-9f7d  1        GE1/1                18    D
[No Vrf]
192.168.0.39     0012-a990-2241  1        GE1/2                20    D
[No Vrf]
```

Table 124 Description on the fields of the display arp command

Field	Description
IP Address	IP address in an ARP entry
MAC Address	MAC address in an ARP entry
VLAN ID	VLAN ID contained a static ARP entry
Interface	Outbound interface in an ARP entry
Aging	Aging time for a dynamic ARP entry in minutes
Type	ARP entry type: D stands for dynamic and S for static.
Vpn-instance Name	Name of VPN instance. [No Vrf] means no VPN instance is configured for the corresponding ARP.

Display the number of all ARP entries

```
<Sysname> display arp all count
Total Entry(ies): 4
```

display arp ip-address

Syntax **display arp** *ip-address* [**verbose**] [| { **begin** | **exclude** | **include** } *string*]

View Any view

Parameter *ip-address*: Displays the ARP entry for the specified IP address.

verbose: Displays the detailed information about ARP entries.

|: Uses a regular expression to specify the ARP entries to be displayed.

begin: Displays the ARP entries from the first one containing the specified string.

exclude: Displays the ARP entries that do not contain the specified string.

Include: Displays the ARP entries that contain the specified string.

string: A case-sensitive string for matching, consisting of 1 to 256 characters.

Description Use the **display arp** *ip-address* command to display the ARP entry for a specified IP address.

Related command: **arp static**, and **reset arp**.

Example # Display the corresponding ARP entry for the IP address 20.1.1.1.

```
<Sysname> display arp 20.1.1.1
                Type: S-Static    D-Dynamic
IP Address       MAC Address     VLAN ID  Interface             Aging Type
20.1.1.1         00e0-fc00-0001  N/A      N/A                   N/A   S
```

display arp timer aging

Syntax **display arp timer aging**

View Any view

Parameter None

Description Use the **display arp timer aging** command to display the aging time for dynamic ARP entries.

Related command: **arp timer aging**.

Example # Display the aging time for dynamic ARP entries.

```
[Sysname] display arp timer aging
Current ARP aging time is 10 minute(s)
```

display arp vpn-instance

Syntax **display arp vpn-instance** *vpn-instance-name* [| { **begin** | **exclude** | **include** } *string* | **count**]

View Any view

Parameter *vpn-instance-name*: Name of VPN instance, a case-sensitive string of 1 to 31 characters. With this argument specified, the ARP entries for a specific VPN instance are displayed.

|: Uses a regular expression to specify the ARP entries to be displayed.

begin: Displays the ARP entries from the first one that contains the specified string.

exclude: Displays the ARP entries that do not contain the specified string.

include: Displays the ARP entries that contain the specified string.

string: A case-sensitive string for matching, consisting of 1 to 256 characters.

count: Displays the number of ARP entries.

Description Use the **display arp vpn-instance** command to display the ARP entries for a specified VPN instance.

Related command: **arp static** and **reset arp**.

Example # Display ARP entries for the VPN instance named test.

```
<Sysname> display arp vpn-instance test
                Type: S-Static    D-Dynamic
IP Address       MAC Address     VLAN ID  Interface             Aging Type
20.1.1.1         00e0-fc00-0001  N/A      N/A                   N/A   S
```

naturemask-arp enable

Syntax **naturemask-arp enable**

undo naturemask-arp enable

View System view

Parameter None

Description Use the **naturemask-arp enable** command to cancel the restriction that ARP requests must be from the same subnet. In this case, ARP requests from a natural network are supported.

Use the **undo naturemask-arp enable** command to restore the default.

By default, the support for ARP requests from a natural network is disabled.

Example # Enable the support for ARP requests from a natural network.

```
<Sysname> system-view
[Sysname] naturemask-arp enable
```

reset arp

Syntax **reset arp** { **all** | **dynamic** | **static** | **interface** *interface-type interface-number* }

View User view

Parameter **all:** Clears all ARP entries.

dynamic: Clears all dynamic ARP entries.

static: Clears all static ARP entries.

interface *interface-type interface-number*: Clears the ARP entries for the interface specified by the argument *interface-type interface-number*.

Description Use the **reset arp** command to clear ARP entries except authorized ARP entries from the ARP mapping table.

Note that with **interface** *interface-type interface-number* specified, the command clears only dynamic entries for the interface.

Related command: **arp static** and **display arp**.

Example # Clear all static ARP entries.

```
<Sysname> reset arp static
```

47 GRATUITOUS ARP CONFIGURATION COMMANDS

gratuitous-arp-sending enable

Syntax **gratuitous-arp-sending enable**

undo gratuitous-arp-sending enable

View System view

Parameter None

Description Use the **gratuitous-arp-sending enable** command to enable a device to send gratuitous ARP packets when receiving ARP requests from another network segment.

Use the **undo gratuitous-arp-sending enable** command to restore the default.

By default, a device cannot send gratuitous ARP packets when receiving ARP requests from another network segment.

Example # Disable a device from sending gratuitous ARP packets

```
<Sysname> system-view
[Sysname] undo gratuitous-arp-sending enable
```

gratuitous-arp-learning enable

Syntax **gratuitous-arp-learning enable**

undo gratuitous-arp-learning enable

View System view

Parameter None

Description Use the **gratuitous-arp-learning enable** command to enable the gratuitous ARP packet learning function.

Use the **undo gratuitous-arp-learning enable** command to disable the function.

By default, the function is disabled.

Example # Enable the gratuitous ARP packet learning function.

```
<Sysname> system-view
[Sysname] gratuitous-arp-learning enable
```

48 ARP SOURCE SUPPRESSION CONFIGURATION COMMANDS

arp source-suppression enable

Syntax **arp source-suppression enable**

undo arp source-suppression enable

View System view

Parameter None

Description Use the **arp source-suppression enable** command to enable the ARP source suppression function.

Use the **undo arp source-suppression enable** command to disable the function.

By default, the ARP source suppression function is disabled.

Related command: **display arp source-suppression**.

Example # Enable the ARP source suppression function.

```
<Sysname> system-view
System View: return to User View with Ctrl+Z.
[Sysname] arp source-suppression enable
```

arp source-suppression limit

Syntax **arp source-suppression limit** *limit-value*

undo arp source-suppression limit

View System view

Parameter *limit-value*: Specifies the maximum number of packets with the same source IP address but unresolvable destination IP addresses that a port can receive in five seconds. It ranges from 2 to 1,024.

Description Use the **arp source-suppression limit** command to set the maximum number of packets with the same source IP address but unresolvable destination IP addresses that a port can receive in five seconds.

Use the **undo arp source-suppression limit** command to restore the default value, which is 10.

Related command: **display arp source-suppression**.

Example # Set to 100 the maximum number of packets with the same source address but unresolvable destination IP addresses that a port can receive in five seconds.

```
<Sysname> system-view
[Sysname] arp source-suppression limit 100
```

display arp source-suppression

Syntax **display arp source-suppression**

View Any view

Parameter None

Description Use the **display arp source-suppression** command to display information about the current ARP source suppression configuration.

Example # Display information about the current ARP source suppression configuration.

```
<Sysname> display arp source-suppression
 ARP source suppression is enabled
 Current suppression limit: 100
 Current cache length: 16
```

Table 125 Description on fields of display arp source-suppression

Field	Description
ARP source suppression is enabled	The ARP source suppression function is enabled.
Current suppression limit	Maximum number of packets with the same source IP address but unresolvable IP addresses that the device can receive in five seconds
Current cache length	Size of cache used to record source suppression information

49 AUTHORIZED ARP CONFIGURATION COMMANDS

This feature is supported on Layer 3 Ethernet interfaces only.

arp authorized enable

Syntax **arp authorized enable**

undo arp authorized enable

View Layer 3 Ethernet interface view

Parameter None

Description Use the **arp authorized enable** command to enable authorized ARP on an interface, which at the same time is enabled with authorized ARP aging detection but disabled from learning dynamic ARP entries.

Use the **undo arp authorized enable** command to disable authorized ARP on the interface, which at the same time is enabled to learn dynamic ARP entries.

By default, authorized ARP is not enabled on the interface.

Example # Enable authorized ARP on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] arp authorized enable
```

arp authorized time-out

Syntax **arp authorized time-out** *seconds*

undo arp authorized time-out

View Layer 3 Ethernet interface view

Parameter *seconds*: Aging time for authorized ARP entries in seconds, in the range 30 to 86400.

Description Use the **arp authorized time-out** command to configure the aging time for authorized ARP entries.

Use the **undo arp authorized time-out** command to restore the default.

By default, the aging time for authorized ARP entries is 1200 seconds.

Example # Configure the aging time for authorized ARP entries.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] arp authorized time-out 120
```

50 PROXY ARP CONFIGURATION COMMANDS

proxy-arp enable

Syntax **proxy-arp enable**

undo proxy-arp enable

View VLAN interface view/Ethernet interface view

Parameter None

Description Use the **proxy-arp enable** command to enable proxy ARP.

Use the **undo proxy-arp enable** command to disable proxy ARP.

By default, proxy ARP is disabled.

Related command: **display proxy-arp**.

Example # Enable proxy ARP on Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] proxy-arp enable
```

local-proxy-arp enable

Syntax **local-proxy-arp enable**

undo local-proxy-arp enable

View VLAN interface view

Parameter None

Description Use the **local-proxy-arp enable** command to enable local proxy ARP.

Use the **undo local-proxy-arp enable** command to disable local proxy ARP.

By default, local proxy ARP is disabled.

Related command: **display local-proxy-arp**.

Example # Enable local proxy ARP on VLAN-interface 2.

```
<Sysname> system-view
[Sysname] interface Vlan-interface 2
[Sysname-Vlan-interface2] local-proxy-arp enable
```

display proxy-arp

Syntax **display proxy-arp** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Displays the proxy ARP status of the interface specified by the argument *interface-type interface-number*.

Description Use the **display proxy-arp** command to display the proxy ARP status.

Related command: **proxy-arp enable**.

Example # Display the proxy ARP status on Ethernet 1/0.

```
<Sysname> display proxy-arp interface ethernet 1/0
Interface Ethernet 1/0
 Proxy ARP status: disabled
```

display local-proxy-arp

Syntax **display local-proxy-arp** [**interface vlan-interface** *vlan-id*]

View Any view

Parameter **interface vlan-interface** *vlan-id*: Displays the local proxy ARP status of the specified VLAN interface.

Description Use the **display local-proxy-arp** command to display the status of the local proxy ARP.

Related command: **local-proxy-arp enable**.

Example # Display the status of the local proxy ARP on VLAN-interface 2.

```
<Sysname> display local-proxy-arp interface vlan-interface 2
Interface Vlan-interface2
 Local Proxy ARP status: enabled
```

51 DHCP SERVER CONFIGURATION COMMANDS

- *The DHCP server configuration is supported only on Layer 3 Ethernet interfaces (or subinterfaces), virtual Ethernet interfaces, VLAN interfaces, serial interfaces, and loopback interfaces. The subaddress pool configuration is not supported on serial and loopback interfaces.*
- *DHCP Snooping must be disabled on the DHCP server.*

bims-server

Syntax **bims-server ip** *ip-address* [**port** *port-number*] **sharekey** *key*

undo bims-server

View DHCP address pool view

Parameter **ip** *ip-address*: Specifies the IP address of a BIMS server.

port *port-number*: Specifies a port number for the BIMS server in the range 1 to 65534.

sharekey *key*: Specifies a shared key for the BIMS server, which is a string of 1 to 16 characters.

Description Use the **bims-server** command to specify the IP address, port number, and shared key of a BIMS server in the DHCP address pool for the client.

Use the **undo bims-server** command to remove specified BIMS server information from the DHCP address pool.

By default, the related information of the BIMS server is not specified.

If you execute the **bims-server** command repeatedly, the latest configuration will overwrite the previous one.

Related commands: **dhcp server ip-pool**.

Example # Specify the IP address 1.1.1.1, port number 80, shared key aabbcc of the BIMS server in DHCP address pool 0 for the client.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] bims-server ip 1.1.1.1 port 80 sharekey aabbcc
```

bootfile-name

Syntax **bootfile-name** *bootfile-name*

undo bootfile-name

View DHCP address pool view

Parameter *bootfile-name*: Boot file name, a string of 1 to 63 characters.

Description Use the **bootfile-name** command to specify a bootfile name in the DHCP address pool for the client.

Use the **undo bootfile-name** command to remove the specified bootfile name from the DHCP address pool.

By default, no bootfile name is specified.

If you execute the **bootfile-name** command repeatedly, the latest configuration will overwrite the previous one.

Example # Specify the bootfile name aaa in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] bootfile-name aaa
```

dhcp enable

Syntax **dhcp enable**

undo dhcp enable

View System view

Parameter None

Description Use the **dhcp enable** command to enable DHCP.

Use the **undo dhcp enable** command to disable DHCP.

By default, DHCP is disabled.

You need to enable DHCP before performing DHCP server and relay agent configurations.

Example # Enable DHCP.

```
<Sysname> system-view
[Sysname] dhcp enable
```

dhcp select server global-pool

Syntax **dhcp select server global-pool** [**subaddress**]

undo dhcp select server global-pool subaddress

View Interface view

Parameter **subaddress**: Supports subaddress allocation. That is, the DHCP server and clients are on the same network segment, and the server allocates IP addresses from the address pool containing the network segment of the first subaddress if several subaddresses exist.

Description Use the **dhcp select server global-pool** command to enable the DHCP server on an interface. After the interface receives a DHCP request from the DHCP client, the DHCP server will allocate an IP address from the address pool.

Use the **undo dhcp select server global-pool subaddress** command to cancel the support for subaddress allocation.

By default, the DHCP server is enabled on an interface.

Example # Enable the DHCP server on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp select server global-pool
```

dhcp server detect

Syntax **dhcp server detect**

undo dhcp server detect

View System view

Parameter None

Description Use the **dhcp server detect** command to enable pseudo DHCP server detection.

Use the **undo dhcp server detect** command to disable the function.

By default, the function is disabled.

Example # Enable pseudo DHCP server detection.

```
<Sysname> system-view
[Sysname] dhcp server detect
```

dhcp server forbidden-ip

Syntax **dhcp server forbidden-ip** *low-ip-address* [*high-ip-address*]

undo dhcp server forbidden-ip *low-ip-address* [*high-ip-address*]

View System view

Parameter *low-ip-address*: Start IP address of the IP address range to be excluded from dynamic allocation.

high-ip-address: End IP address of the IP address range to be excluded from dynamic allocation. The end IP address must have a higher sequence than the start one.

Description Use the **dhcp server forbidden-ip** command to exclude IP addresses from dynamic allocation.

Use the **undo dhcp server forbidden-ip** command to remove the configuration.

By default, all IP addresses in a DHCP address pool are assignable except IP addresses of the DHCP server interfaces.

Note that:

- When you use the **dhcp server forbidden-ip** command to exclude an IP address that is bound to a user from dynamic assignment, the address can be still assigned to the user.
- When you use the **undo dhcp server forbidden-ip** command to remove the configuration, the specified address/address range must be consistent with the one specified in the **dhcp server forbidden-ip** command. If you have configured to exclude an address range from dynamic assignment, you need to specify an address range in the **undo dhcp server forbidden-ip** command instead of specifying one IP address.

Related command: **dhcp server ip-pool**, **network**, and **static-bind ip-address**.

Example # Exclude the IP address range 10.110.1.1 to 10.110.1.63 from dynamic allocation.

```
<Sysname> system-view
[Sysname] dhcp server forbidden-ip 10.110.1.1 10.110.1.63
```

dhcp server ip-pool

Syntax **dhcp server ip-pool** *pool-name*

undo dhcp server ip-pool *pool-name*

View System view

Parameter *pool-name*: Global address pool name, which is a unique pool identifier, a string of 1 to 35 characters.

Description Use the **dhcp server ip-pool** command to create a DHCP address pool and enter its view. If the pool was created, you will directly enter its view.

Use the **undo dhcp server ip-pool** command to remove specified DHCP address pool.

By default, no DHCP address pool is created.

Related command: **dhcp enable**.

Example # Create the DHCP address pool identified by 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0]
```

dhcp server ping packets

Syntax **dhcp server ping packets** *number*

undo dhcp server ping packets

View System view

Parameter *number*: Number of ping packets, in the range of 0 to 10. If the ping timeout time is set to 0, the DHCP server will not perform any ping collision detection.

Description Use the **dhcp server ping packets** command to specify the maximum number of ping packets on the DHCP server.

Use the **undo dhcp server ping packets** command to restore the default.

The number defaults to 1.

Example # Specify the maximum number of ping packets as 1.

```
<Sysname> system-view
[Sysname] dhcp server ping packets 10
```

dhcp server ping timeout

Syntax **dhcp server ping timeout** *milliseconds*

undo dhcp server ping timeout

View System view

Parameter *milliseconds*: Response timeout value for ping packets in milliseconds, in the range of 0 to 10,000. If the ping timeout time is set to 0, the DHCP server will not perform any ping collision detection.

Description Use the **dhcp server ping timeout** command to configure response timeout time of the ping packet on the DHCP server.

Use the **undo dhcp server ping timeout** command to restore the default.

The time defaults to 500.

Example # Specify the response timeout time as 1000ms.

```
<Sysname> system-view
[Sysname] dhcp server ping timeout 1000
```

dhcp server relay information enable

Syntax **dhcp server relay information enable**

undo dhcp server relay information enable

View System view.

Parameter None

Description Use the **dhcp server relay information enable** command to enable the DHCP server to handle option 82.

Use the **undo dhcp server relay information enable** command to disable the DHCP server from handling option 82.

By default, the DHCP server handles Option 82.

Example # Configure the DHCP server to ignore Option 82.

```
<Sysname> system-view
[Sysname] undo dhcp server relay information enable
```

dhcp update arp

Syntax **dhcp update arp**

undo dhcp update arp

View Interface view

Parameter None

Description Use the **dhcp update arp** command to configure the DHCP server to support authorized ARP.

Use the **undo dhcp update arp** command to restore the default.

By default, the DHCP server does not support authorized ARP.

Example # Configure Ethernet 1/0 to support authorized ARP.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp update arp
```

display dhcp server conflict

Syntax **display dhcp server conflict** { **all** | **ip** *ip-address* }

View Any view

Parameter **all**: Displays information about all IP address conflicts.

ip-address: Displays conflict information for the IP address.

Description Use the **display dhcp server conflict** command to display information about IP address conflicts.

Related command: **reset dhcp server conflict**.

Example # Display information about all IP address conflicts.

```
Address              Discover time
    4.4.4.1              Apr 25 2007 16:57:20
    4.4.4.2              Apr 25 2007 17:00:10
 --- total 2 entry ---
```

Table 126 Description on fields of the display dhcp server conflict command

Field	Description
Address	Conflicted IP address
Discover Time	Time when the conflict was discovered

display dhcp server expired

Syntax **display dhcp server expired** { **all** | **ip** *ip-address* | **pool** [*pool-name*] }

View Any view

Parameter **all**: Displays the lease expiration information of all DHCP address pools.

ip *ip-address*: Displays the lease expiration information of a specified IP address.

pool [*pool-name*]: Displays the lease expiration information of a specified address pool. The *pool name* is a string of 1 to 35 characters. If the *pool name* is not specified, the lease expiration information of all address pools is displayed.

Description Use the **display dhcp server expired** command to display the lease expiration information of specified DHCP address pool(s) or an IP address.

DHCP will assign these expired IP addresses to DHCP clients after all addresses have been assigned.

Example # Display information about lease expirations in all DHCP address pools.

```
Global pool:
 IP address       Client-identifier/    Lease expiration          Type
                    Hardware address
 4.4.4.6          3030-3066-2e65-3230-  Apr 25 2007 17:10:47     Release
                   302e-3130-3234-2d45-
                   7468-6572-6e65-7430-
                   2f31
 --- total 1 entry ---
```

Table 127 Description on fields of the display dhcp server expired command

Field	Description
Global pool	Information about lease expiration of a DHCP address pool
IP address	Expired IP addresses
Client-identifier/Hardware address	IDs or MACs of clients whose IP addresses were expired
Lease expiration	The lease expiration time
Type	Types of lease expirations. Currently, this field is set to Release.

display dhcp server free-ip

Syntax **display dhcp server free-ip**

View Any view

Parameter None

Description Use the **display dhcp server free-ip** command to display information about assignable IP addresses, which have never been assigned.

Example # Display information about assignable IP addresses.

```
<Sysname> display dhcp server free-ip
IP Range from 10.0.0.0              to  10.0.0.255
```

display dhcp server forbidden-ip

Syntax **display dhcp server forbidden-ip**

View Any view

Parameter None

Description Use the **display dhcp server forbidden-ip** command to display IP addresses excluded from dynamic allocation in DHCP address pool.

Example # Display IP addresses excluded from dynamic allocation in the DHCP address pool.

```
<Sysname> display dhcp server forbidden-ip
IP Range from 1.1.1.1              to  1.1.1.1
IP Range from 2.2.2.2              to  2.2.2.5
```

display dhcp server ip-in-use

Syntax **display dhcp server ip-in-use** { **all** | **ip** *ip-address* | **pool** [*pool-name*] }

View Any view

Parameter **all**: Displays the binding information of all DHCP address pools.

ip *ip-address*: Displays the binding information of a specified IP address.

pool [*pool-name*]: Displays the binding information of a specified address pool. The *pool name* is a string of 1 to 35 characters. If no *pool name* is specified, the binding information of all address pools is displayed.

Description Use the **display dhcp server ip-in-use** command to display the binding information of DHCP address pool(s) or an IP address.

Related command: **reset dhcp server ip-in-use**.

Example # Display the binding information of all DHCP address pools.

```
<Sysname> display dhcp server ip-in-use all
 Global pool:
 IP address    Client-identifier/    Lease expiration        Type
                Hardware address
 10.1.1.1       4444-4444-4444        NOT Used              Manual

--- total 1 entry ---
```

Table 128 Description on fields of the display dhcp server ip-in-use command

Field	Description
Global pool	Binding information of a DHCP address pool
IP address	Bound IP address
Client-identifier/Hardware address	Client's ID or MAC of the binding
Lease expiration	Lease expiration time

Table 128 Description on fields of the display dhcp server ip-in-use command

Field	Description
Type	Binding types, including Manual, Auto:OFFERED and Auto:COMMITTED. ■ Manual: Static binding ■ Auto:OFFERED: The binding sent in the DHCP-OFFER message from the server to the client. ■ Auto:COMMITTED: The binding sent in the DHCP-ACK message from the server to the client.

display dhcp server statistics

Syntax **display dhcp server statistics**

View Any view

Parameter None

Description Use the **display dhcp server statistics** command to display the statistics of the DHCP server.

Related command: **reset dhcp server statistics**.

Example # Display the statistics on the DHCP server.

```
<Sysname> display dhcp server statistics
    Global Pool:
      Pool Number:                    1
      Binding:
        Auto:                          1
        Manual:                        0
        Expire:                        0
    BOOTP Request:                    13
      DHCPDISCOVER:                    3
      DHCPREQUEST:                     7
      DHCPDECLINE:                     0
      DHCPRELEASE:                     3
      DHCPINFORM:                      0
      BOOTPREQUEST:                    0
    BOOTP Reply:                      9
      DHCPOFFER:                       3
      DHCPACK:                         6
      DHCPNAK:                         0
      BOOTPREPLY:                      0
    Bad Messages:                     0
```

Table 129 Description on fields of the display dhcp server statistics command

Field	Description
Global Pool	Statistics of a DHCP address pool
Pool Number	The number of address pools
Auto	The number of dynamic bindings

Table 129 Description on fields of the display dhcp server statistics command

Field	Description
Manual	The number of static bindings
Expire	The number of expired bindings
BOOTP Request	The number of DHCP requests sent from DHCP clients to the DHCP server, including: ■ DHCPDISCOVER ■ DHCPREQUEST ■ DHCPDECLINE ■ DHCPRELEASE ■ DHCPINFORM ■ BOOTPREQUEST
BOOTP Reply	The number of DHCP replies sent from the DHCP server to DHCP clients, including: ■ DHCPOFFER ■ DHCPACK ■ DHCPNAK ■ BOOTPREPLY
Bad Messages	The number of erroneous messages

display dhcp server tree

Syntax **display dhcp server tree** { **all** | **pool** [*pool-name*] }

View Any view

Parameter **all**: Displays the tree organization information of all DHCP address pools.

pool [*pool-name*]: Displays the tree organization information of a specified address pool. The *pool name* is a string of 1 to 35 characters. If no *pool name* is specified, the tree organization information of all address pools will be displayed.

Description Use the **display dhcp server tree** command to display the tree organization information of DHCP address pool(s).

Example # Display the tree organization information of all DHCP address pools.

```
<Sysname> display dhcp server tree all
Global pool:

Pool name: 0
 network 20.1.1.0 mask 255.255.255.0
 Sibling node:1
 option 2 ip-address 1.1.1.1
 expired 1 0 0

Pool name: 1
 static-bind ip-address 10.10.1.2 mask 255.0.0.0
 static-bind mac-address 00e0-00fc-0001
```

```
PrevSibling node:0
expired unlimited
```

Table 130 Description on fields of the display dhcp server tree command

Field	Description
Global pool	Information of a address pool
Pool name	Address pool name
network	Network segment for address allocation
static-bind ip-address 10.10.1.2 mask 255.0.0.0	The IP address and MAC address of the static binding
static-bind mac-address 00e0-00fc-0001	
Sibling node	The sibling node of the current node, nodes of this kind in the output are: ■ Child node: The child node (subnet segment) address pool of the current node ■ Parent node: The parent node (nature network segment) address pool of the current node ■ Sibling node: The latter sibling node of the current node (another subnet of the same nature network). The earlier the sibling node is configured, the higher selection priority the sibling node has. ■ PrevSibling node: The previous sibling node of the current node
option	Self-defined DHCP options
expired	The lease duration, in the format of day, hour, and minute

dns-list

Syntax **dns-list** *ip-address*&<1-8>

undo dns-list { *ip-address* | **all** }

View DHCP address pool view

Parameter *ip-address*&<1-8>: DNS server IP address. &<1-8> means you can specify up to eight DNS server addresses separated by spaces.

all: Specifies all DNS server addresses to remove.

Description Use the **dns-list** command to specify DNS server addresses in a DHCP address pool.

Use the **undo dns-list** command to remove DNS server addresses from a DHCP address pool.

By default, no DNS server address is specified.

If you repeatedly use the **dns-list** command, the latest configuration will overwrite the previous one.

Related command: **dhcp server ip-pool**.

Example # Specify the DNS server address 10.1.1.254 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] dns-list 10.1.1.254
```

domain-name

Syntax **domain-name** *domain-name*

undo domain-name

View DHCP address pool view

Parameter *domain-name*: DHCP client domain name suffix, a string of 1 to 50 characters.

Description Use the **domain-name** command to specify the DHCP client domain name suffix in a DHCP address pool.

Use the **undo domain-name** command to remove the domain name suffix from a DHCP address pool.

The domain name suffix is not specified by default.

Related command: **dhcp server ip-pool**.

Example # Specify the client domain name suffix as mydomain.com in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] domain-name mydomain.com
```

expired

Syntax **expired** { **day** *day* [**hour** *hour* [**minute** *minute*]] | **unlimited** }

undo expired

View DHCP address pool view

Parameter **day** *day*: Specifies the number of days, in the range of 0 to 365.

hour *hour*: Specified the number of hours, in the range of 0 to 23.

minute *minute*: Specifies the number of minutes, in the range of 0 to 59.

unlimited: Specifies the infinite duration, which is actually 136 years.

Description Use the **expired** command to specify the lease duration in a DHCP address pool.

Use the **undo expired** command to restore the default lease duration in a DHCP address pool.

The lease duration defaults to one day.

Note that if the lease duration you specified is beyond the year 2106, the system regards the lease as expired.

Related command: **dhcp server ip-pool**.

Example # Specify the lease duration as one day, two hours and three minutes in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] expired day 1 hour 2 minute 3
```

gateway-list

Syntax **gateway-list** *ip-address*&<1-8>

undo gateway-list { *ip-address* | **all** }

View DHCP address pool view

Parameter *ip-address*&<1-8>: Gateway IP address. &<1-8> means you can specify up to eight gateway addresses separated by spaces.

all: Specifies all gateway IP addresses to be removed.

Description Use the **gateway-list** command to specify gateway address(es) in a DHCP address pool.

Use the **undo gateway-list** command to remove specified gateway address(es) from a DHCP address pool.

By default, no gateway address is specified.

If you use the **gateway-list** command repeatedly, the latest configuration will overwrite the previous one.

Example # Specify the gateway address 10.110.1.99 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] gateway-list 10.110.1.99
```

nbns-list

Syntax **nbns-list** *ip-address*&<1-8>

undo nbns-list { *ip-address* | **all** }

View DHCP address pool view

Parameter *ip-address*&<1-8>: WINS server IP address. &<1-8> means you can specify up to eight WINS server addresses separated by spaces.

all: Specifies all WINS server addresses to be removed.

Description Use the **nbns-list** command to specify WINS server address(es) in a DHCP address pool.

Use the **undo nbns-list** command to remove WINS server address(es) from a DHCP address pool.

By default, no WINS server address is specified.

If you use the **nbns-list** command repeatedly, the latest configuration will overwrite the previous one.

Related command: **dhcp server ip-pool** and **netbios-type**.

Example # Specify WINS server address 10.12.1.99 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] nbns-list 10.12.1.99
```

netbios-type

Syntax **netbios-type** { **b-node** | **h-node** | **m-node** | **p-node** }

undo netbios-type

View DHCP address pool view

Parameter **b-node**: Broadcast node. A b-node client sends the destination name in a broadcast message. The destination returns the name-to-IP mapping to the client after receiving the message.

p-node: Peer-to-peer node. A p-node client sends the destination name in a unicast message to the WINS server, and the WINS server returns the mapping to the client.

m-node: Mixed node, a combination of a b-node first and p-node second. An m-node client broadcasts the destination name, if there is no response, and then unicasts the destination name to the WINS server to get the mapping.

h-node: Hybrid node, a combination of a p-node first and b-node second. An h-node is a p-node with the peer-to-peer communication mechanism. An h-node client unicasts the destination name to the WINS server, if there is no response, and then broadcasts it to get the mapping from the destination.

Description Use the **netbios-type** command to specify the client NetBIOS node type in a DHCP address pool.

Use the **undo netbios-type** command to remove the client NetBIOS node type from a DHCP address pool.

No NetBIOS node type is specified by default.

Related command: **dhcp server ip-pool** and **nbns-list**.

Example # Specify the NetBIOS node type as b-node in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] netbios-type b-node
```

network

Syntax **network** *ip-address* [*mask-length* | **mask** *mask*]

undo network

View DHCP address pool view

Parameter *ip-address*: IP address range for dynamic allocation. If no mask length and mask is specified, the natural mask will be used.

mask-length: Mask length, in the range of 1 to 30.

mask *mask*: Specifies the IP address network mask, in dotted decimal notation.

Description Use the **network** command to specify the IP address range for dynamic allocation in a DHCP address pool.

Use the **undo network** command to remove the specified address range.

No IP address range is specified by default.

Note that you can specify only one network segment for each DHCP global address pool. If you use the **network** command repeatedly, the latest configuration will overwrite the previous one.

Related command: **dhcp server ip-pool** and **dhcp server forbidden-ip**.

Example # Specify 192.168.8.0/24 as the address range for dynamic allocation in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] network 192.168.8.0 mask 255.255.255.0
```

option

Syntax **option** *code* { **ascii** *ascii-string* | **hex** *hex-string*&<1-16> | **ip-address** *ip-address*&<1-8> }

undo option *code*

View DHCP address pool view

Parameter *code*: Self-defined option number, in the range of 2 to 254.

ascii *ascii-string*: Specifies an ASCII string with 1 to 63 characters.

hex *hex-string*&<1-16>: Specifies hex digit strings. &<1-16> indicates you can specify up to 16 hex digit strings, separated by spaces. Each string contains 2, 4, 6 or 8 hex digits.

ip-address *ip-address*&<1-8>: Specifies IP addresses. &<1-8> indicates you can specify up to eight IP addresses, separated by spaces.

Description Use the **option** command to configure a self-defined DHCP option in a DHCP address pool.

Use the **undo option** command to remove a self-defined DHCP option from a DHCP address pool.

The **option** command is not configured by default.

If you use the **option** command repeatedly, the latest configuration will overwrite the previous one.

Related command: **dhcp server ip-pool**.

Example # Configure the hex digits 0x11 and 0x22 for the self-defined DHCP option 100 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] option 100 hex 11 22
```

reset dhcp server conflict

Syntax **reset dhcp server conflict** { **all** | **ip** *ip-address* }

View User view

Parameter **all**: Clears the statistics of all IP address conflicts.

ip *ip-address*: Clears the conflict statistics of a specified IP address.

Description Use the **reset dhcp server conflict** command to clear statistics of IP address conflict(s).

Related command: **display dhcp server conflict**.

Example # Clear the statistics of all IP address conflicts.

```
<Sysname> reset dhcp server conflict all
```

reset dhcp server ip-in-use

Syntax **reset dhcp server ip-in-use** { **all** | **ip** *ip-address* | **pool** [*pool-name*] }

View User view

Parameter **all**: Clears the IP address dynamic binding information of all DHCP address pools.

ip *ip-address*: Clears the dynamic binding information of a specified IP address.

pool [*pool-name*]: Clears the dynamic binding information of a specified address pool. The *pool name* is a string of 1 to 35 characters. If no *pool name* is specified, the dynamic binding information of all address pools is cleared.

Description Use the **reset dhcp server ip-in-use** command to clear dynamic IP address binding information.

Related command: **display dhcp server ip-in-use**

Example # Clear the binding information of IP address 10.110.1.1.

```
<Sysname> reset dhcp server ip-in-use ip 10.110.1.1
```

reset dhcp server statistics

Syntax **reset dhcp server statistics**

View User view

Parameter None

Description Use the **reset dhcp server statistics** command to clear the statistics of the DHCP server.

Related command: **display dhcp server statistics**.

Example # Clear the statistics of the DHCP server.

```
<Sysname> reset dhcp server statistics
```

static-bind client-identifier

Syntax **static-bind client-identifier** *client-identifier*

undo static-bind client-identifier

View DHCP address pool view

Parameter *client-identifier*: The client ID of a static binding, a string with 4 to 160 characters in the format H-H-H..., each H indicates 4 hex digits except the last H indicates 2 or 4 hex digits. For example, aabb-cccc-dd is a valid ID, while aabb-c-dddd and aabb-cc-dddd are both invalid.

Description Use the **static-bind client-identifier** command to specify the client ID of a static binding in a DHCP address pool.

Use the **undo static-bind client-identifier** command to remove the client ID of a static binding from a DHCP address pool.

By default, no client ID is specified.

Note that:

- Use the **static-bind client-identifier** command together with the **static-bind ip-address** command to accomplish a static binding configuration.
- The ID of the static binding of a client must be identical to the ID displayed by using the **display dhcp client verbose** command on the client. Otherwise, the client cannot obtain an IP address.
- If you use the **static-bind client-identifier** or **static-bind mac-address** command repeatedly, the latest configuration will overwrite the previous one.

Related command: **dhcp server ip-pool**, **static-bind ip-address**, **static-bind mac-address**, and **display dhcp client verbose**.

Example # Bind the client ID aaaa-bbbb to the IP address 10.1.1.1 with the mask 255.255.255.0 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] static-bind ip-address 10.1.1.1 mask 255.255.255.0
[Sysname-dhcp-pool-0] static-bind client-identifier aaaa-bbbb
```

static-bind ip-address

Syntax **static-bind ip-address** *ip-address* [*mask-length* | **mask** *mask*]

undo static-bind ip-address

View DHCP address pool view

Parameter *ip-address*: IP address of a static binding, if no mask and mask length is specified, the natural mask is used.

mask-length: Mask length of the IP address, that is, the number of digit 1 in the mask.

mask *mask*: Specifies the IP address mask.

Description Use the **static-bind ip-address** command to specify the IP address of a static binding in a DHCP address pool.

Use the **undo static-bind ip-address** command to remove the IP address of a static binding from a DHCP address pool.

By default, no IP address of a static binding in a DHCP address pool is specified.

Note that:

- Use the **static-bind ip-address** command together with the **static-bind mac-address** or **static-bind client-identifier** command to accomplish a static binding configuration.
- If the IP address of a static binding is an interface address of the DHCP server, the static binding does not take effect.
- If you use the **static-bind ip-address** command repeatedly, the latest configuration will overwrite the previous one.

Related command: **dhcp server ip-pool**, **static-bind client-identifier** and **static-bind mac-address**.

Example # Bind the client MAC address 0000-e03f-0305 to the IP address 10.1.1.1 with the mask 255.255.255.0 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] static-bind ip-address 10.1.1.1 mask 255.255.255.0
[Sysname-dhcp-pool-0] static-bind mac-address 0000-e03f-0305
```

static-bind mac-address

Syntax **static-bind mac-address** *mac-address*

undo static-bind mac-address

View DHCP address pool view

Parameter *mac-address*: The MAC address of a static binding, in the format H-H-H.

Description Use the **static-bind mac-address** command to specify the MAC address of a static binding in a DHCP address pool.

Use the **undo static-bind mac-address** command to remove the MAC address of a static binding from a DHCP address pool.

By default, no MAC address is specified.

Note that:

- Use the **static-bind mac-address** command together with the **static-bind ip-address** command to complete a static binding configuration.
- If you use the **static-bind mac-address** or **static-bind client-identifier** command repeatedly, the latest configuration will overwrite the previous one.

Relate command: **dhcp server ip-pool**, **static-bind client-identifier** and **static-bind ip-address.**

Example # Bind the client MAC address 0000-e03f-0305 to the IP address 10.1.1.1 with the mask 255.255.255.0 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] static-bind ip-address 10.1.1.1 mask 255.255.255.0
[Sysname-dhcp-pool-0] static-bind mac-address 0000-e03f-0305
```

tftp-server domain-name

Syntax **tftp-server domain-name** *domain-name*

undo tftp-server domain-name

View DHCP address pool view

Parameter *domain-name*: TFTP server name, a string of 1 to 63 characters.

Description Use the **tftp-server domain-name** command to specify a TFTP server name in a DHCP address pool.

Use the **undo tftp-server domain-name** command to remove the TFTP server name from a DHCP address pool.

By default, no TFTP server name is specified.

Using the **tftp-server domain-name** command repeatedly will overwrite the previous configuration.

Example # Specify the TFTP server name as aaa in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] tftp-server domain-name aaa
```

tftp-server ip-address

Syntax **tftp-server ip-address** *ip-address*

undo tftp-server ip-address

View DHCP address pool view

Parameter *ip-address:* TFTP server IP address.

Description Use the **tftp-server ip-address** command to specify the TFTP server IP address in a DHCP address pool.

Use the **undo tftp-server ip-address** command to remove the TFTP server IP address from a DHCP address pool.

By default, no TFTP server address is specified.

Using the **tftp-server ip-address** command repeatedly will overwrite the previous configuration.

Example # Specify the TFTP server address 10.1.1.1 in DHCP address pool 0.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] tftp-server ip-address 10.1.1.1
```

voice-config

Syntax **voice-config** { **as-ip** *ip-address* | **fail-over** *ip-address dialer-string* | **ncp-ip** *ip-address* | **voice-vlan** *vlan-id* { **disable** | **enable** } }

undo voice-config [**as-ip** | **fail-over** | **ncp-ip** | **voice-vlan**]

View DHCP address pool view.

Parameter **as-ip** *ip-address*: Specifies IP address for the backup network calling processor.

fail-over *ip-address dialer-string*: Specifies the failover IP address and dialer string. The *dialer-string* is a string of 1 to 39 characters, which can be 0 to 9, and "*".

ncp-ip *ip-address*: Specifies IP address for the primary network calling processor.

voice-vlan *vlan-id*: Specifies the voice VLAN ID, in the range of 2 to 4094.

- **disable**: Disables the specified voice VLAN ID, meaning DHCP clients will not take this ID as their voice VLAN.
- **enable**: Enables the specified voice VLAN ID, meaning DHCP clients will take this ID as their voice VLAN.

Description Use the **voice-config** command to configure specified Option 184 contents in a DHCP address pool.

Use the **undo voice-config** command to remove specified option 184 contents from a DHCP address pool.

By default, no Option 184 content is configured.

Note that specifying the IP address of a network calling processor first is necessary to make other configured parameters take effect.

Example # Configure Option 184 in DHCP address pool 0: the primary network calling processor 10.1.1.1, backup network calling processor 10.2.2.2, voice VLAN ID 3 that is enabled, the failover IP address 10.3.3.3 and dialer string 99*.

```
<Sysname> system-view
[Sysname] dhcp server ip-pool 0
[Sysname-dhcp-pool-0] voice-config ncp-ip 10.1.1.1
[Sysname-dhcp-pool-0] voice-config as-ip 10.2.2.2
[Sysname-dhcp-pool-0] voice-config voice-vlan 3 enable
[Sysname-dhcp-pool-0] voice-config fail-over 10.3.3.3 99*
```

52 DHCP RELAY AGENT CONFIGURATION COMMANDS

- *The DHCP relay agent configuration is supported only on the Layer 3 Ethernet interface (or subinterface), virtual Ethernet interface, VLAN interface, and serial interface.*
- *DHCP Snooping cannot be configured on the DHCP relay agent.*

dhcp enable

Syntax **dhcp enable**

undo dhcp enable

View System view

Parameter None

Description Use the **dhcp enable** command to enable DHCP.

Use the **undo dhcp enable** command to disable DHCP.

By default, DHCP is disabled.

For both DHCP server and relay agent configuration, enabling DHCP first is necessary to make other configurations take effect.

Example # Enable DHCP.

```
<Sysname> system-view
[Sysname] dhcp enable
```

dhcp relay address-check

Syntax **dhcp relay address-check** { **disable** | **enable** }

View Interface view

Parameter **disable**: Disables IP address match checking on the relay agent.

enable: Enables IP address match checking on the relay agent.

Description Use the **dhcp relay address-check enable** command to enable IP address match check on the relay agent.

Use the **dhcp relay address-check disable** command to disable IP address match check on the relay agent.

By default, the function is disabled.

Note that this command can be executed only on Layer 3 Ethernet interfaces (including sub-interfaces) and VLAN interfaces.

Example # Enable IP address match checking on the DHCP relay agent.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp relay address-check enable
```

dhcp relay information enable

Syntax **dhcp relay information enable**

undo dhcp relay information enable

View Interface view

Parameter None

Description Use the **dhcp relay information enable** command to enable the relay agent to support option 82.

Use the **undo dhcp relay information enable** command to disable option 82 support.

By default, option 82 support is disabled on DHCP relay agent.

Example # Enable option 82 support on the relay agent.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp relay information enable
```

dhcp relay information format

Syntax **dhcp relay information format** { **normal** | **verbose** [**node-identifier** { **mac** | **sysname** | **user-defined** *node-identifier* }] }

undo dhcp relay information format [**verbose node-identifier**]

View Interface view

Parameter **normal**: Specifies the normal padding format.

verbose: Specifies the verbose padding format.

node-identifier { **mac** | **sysname** | **user-defined** *node-identifier* }: Specifies access node identifier. By default, the node MAC address is used as the node identifier.

- **mac** indicates using MAC address as the node identifier.
- **sysname** indicates using the device name of a node as the node identifier.
- **user-defined** *node-identifier* indicates using a specified character string as the node identifier, in which *node-identifier* is a string with 1 to 50 characters.

Description Use the **dhcp relay information format** command to specify a padding format for option 82.

Use the **undo dhcp relay information format** command to restore the default padding format.

The option 82 padding format defaults to **normal**.

- *Using the **undo dhcp relay information format** command without the keyword **verbose node-identifier** restores the default **normal** padding format, or with the keyword **verbose node-identifier** restores the **mac** mode of the **verbose** padding format.*
- *If configuring the handling strategy of the DHCP relay agent as **replace**, you need to configure a padding format of option 82. If the handling strategy is keep or drop, you need not configure any padding format.*
- *If sub-option 1 (node identifier) of Option 82 is padded with the device name (sysname) of a node, the device name must contain no spaces. Otherwise, the DHCP relay agent will drop the message.*

Example # Specify the verbose padding format for option 82.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp relay information enable
[Sysname-Ethernet1/0] dhcp relay information strategy replace
[Sysname-Ethernet1/0] dhcp relay information format verbose
```

dhcp relay information strategy

Syntax **dhcp relay information strategy** { **drop** | **keep** | **replace** }

undo dhcp relay information strategy

View Interface view

Parameter **drop**: Specifies to drop messages containing option 82.

keep: Specifies to forward messages containing option 82 without any change.

replace: Specifies to forward messages containing option 82 after replacing the original option 82 with the option 82 padded in the specified padding format.

Description Use the **dhcp relay information strategy** command to configure DHCP relay agent handling strategy for messages containing option 82.

Use the **undo dhcp relay information strategy** command to restore the default handling strategy.

The handling strategy for messages containing option 82 defaults to **replace**.

Example # Configure the DHCP relay agent handling strategy for messages containing option 82 as **keep**.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp relay information enable
[Sysname-Ethernet1/0] dhcp relay information strategy keep
```

dhcp relay release ip

Syntax **dhcp relay release** *ip client-ip*

View System view

Parameter *client-ip*: DHCP client IP address.

Description Use the **dhcp relay release ip** command to send a release request to a specified DHCP server for releasing a specified client IP address.

Example # Send a release request to the DHCP server for releasing the IP address 1.1.1.1.

```
<Sysname> system-view
[Sysname] dhcp relay release ip 1.1.1.1
```

dhcp relay security static

Syntax **dhcp relay security static** *ip-address mac-address* [**interface** *interface-type interface-number*]

undo dhcp relay security { *ip-address* | **all** | **dynamic** | **static** }

View System view

Parameter *ip-address*: Specifies a client IP address for creating a static binding.

mac-address: Specifies a client MAC address for creating a static binding, in the format H-H-H.

interface *interface-type interface-number*: Specifies a Layer 3 interface connecting to the DHCP client. *interface-type interface-number* specifies the interface type and interface number.

all: Specifies all entries of client IP-to-MAC bindings to be removed.

dynamic: Specifies entries of dynamic client IP-to-MAC bindings to be removed.

static: Specifies entries of manual client IP-to-MAC bindings to be removed.

Description Use the **dhcp relay security static** command to configure a static addressing binding, that is, the binding between IP address, MAC address, and Layer 3 interface on the relay agent.

Use the **undo dhcp relay security** command to remove specified binding entries from the relay agent.

No manual IP-to-MAC binding is configured on the DHCP relay agent by default.

Note that:

When using the **dhcp relay security static** command to bind an interface to a static binding entry, make sure that the interface is configured as a DHCP relay agent; otherwise, address entry conflicts may occur.

Related command: **display dhcp relay security**.

Example # Bind DHCP relay interface Ethernet 1/0 to IP address 10.10.1.1 and MAC address 0005-5d02-f2b3 of the client.

```
<Sysname> system-view
[Sysname] dhcp relay security static 10.10.1.1 0005-5d02-f2b3 interf
ace ethernet 1/0
```

dhcp relay security tracker

Syntax **dhcp relay security tracker** { *interval* | **auto** }

undo dhcp relay security tracker [*interval*]

View System view

Parameter *interval*: Refreshing interval in seconds, in the range of 1 to 120.

auto: Specifies the **auto** refreshing interval, which is the value of 60 seconds divided by the number of binding entries. Thus, the more entries are, the shorter interval is, but the shortest interval is no less than 500 ms.

Description Use the **dhcp relay security tracker** command to set a refreshing interval at which the relay agent contacts the DHCP server for refreshing dynamic bindings.

Use the **undo dhcp relay security tracker** command to restore the default interval.

The default handshake interval is **auto**, the value of 60 seconds divided by the number of binding entries.

Example # Set the handshake interval as 100 seconds.

```
<Sysname> system-view
[Sysname] dhcp relay security tracker 100
```

dhcp relay server-detect

Syntax **dhcp relay server-detect**

undo dhcp relay server-detect

View System view

Parameter None

Description Use the **dhcp relay server-detect** command to enable pseudo DHCP server detection.

Use the **undo dhcp relay server-detect** command to disable pseudo DHCP server detection.

By default, pseudo DHCP server detection is disabled.

Example # Enable pseudo DHCP server detection.

```
<Sysname> system-view
[Sysname] dhcp relay server-detect
```

dhcp relay server-group

Syntax **dhcp relay server-group** *group-* **ip** *ip-address*

undo dhcp relay server-group *group-id* [**ip** *ip-address*]

View System view

Parameter *group-id*: Specifies a DHCP server group number, in the range of 0 to 19.

ip *ip-address*: Specifies a DHCP server IP address.

Description Use the **dhcp relay server-group** command to specify a DHCP server for a DHCP server group.

Use the **undo dhcp relay server-group** command to remove a DHCP server from a DHCP server group, if no **ip** *ip-address* is specified, all servers in the DHCP server group and the server group itself will be removed.

By default, no DHCP server is specified for a DHCP server group.

Note that:

- The IP address of any DHCP server and any interface's IP address of the DHCP relay agent cannot be in the same network segment. Otherwise, the client may fail to obtain an IP address.
- If a server group has been correlated to multiple interfaces, you need to cancel these correlations before removing the server group.

Related command: **display dhcp relay server-group**.

Example # Specify DHCP server 1.1.1.1 for DHCP server group 1 on the relay agent.

```
<Sysname> system-view
[Sysname] dhcp relay server-group 1 ip 1.1.1.1
```

dhcp relay server-select

Syntax **dhcp relay server-select** *group-id*

undo dhcp relay server-select

View Interface view

Parameter *group-id*: Specifies a DHCP group number to be correlated, in the range of 0 to 19. The specified group must be an existing group containing at least a DHCP server.

Description Use the **dhcp relay server-select** command to correlate specified interface(s) to a specified DHCP server group.

Use the **undo dhcp relay server-select** command to remove a configured correlation.

By default, no DHCP server group is correlated with an interface on the relay agent.

Note that an interface on the relay agent can only be correlated to one DHCP server group, and a newly configured correlation overwrites the previous one. If the server group in the new correlation does not exist, the new configuration will not work. The interface still maintains the previous correlation.

Example # Correlate the interface Ethernet1/0 to the DHCP server group 1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp relay server-select 1
```

dhcp select relay

Syntax **dhcp select relay**

undo dhcp select relay

View Interface view

Parameter None

Description Use the **dhcp select relay** command to enable the relay agent on the current interface, specified or all interfaces. Upon receiving requests from an enabled interface, the relay agent will forward these requests to outside DHCP servers for IP address allocation.

Use the **undo dhcp select relay** command to restore the default on interface(s).

After DHCP is enabled, the DHCP server is enabled on an interface by default. That is, upon receiving a client's request from the interface, the DHCP server allocates an IP address from the DHCP address pool to the client.

When the working mode of the interface is changed from DHCP server to DHCP relay agent, neither the IP address leases nor the authorized ARP entries will be deleted. However, these ARP entries may conflict with the new static entries generated on the DHCP relay agent; therefore, you are recommended to delete the existing IP address leases when changing the interface working mode to DHCP relay agent.

Example # Enable the DHCP relay agent on the interface Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp select relay
```

dhcp update arp

Syntax **dhcp update arp**

undo dhcp update arp

View Interface view

Parameter None

Description Use the **dhcp update arp** command to configure the DHCP relay agent to support authorized ARP.

Use the **undo dhcp update arp** command to restore the default.

By default, the DHCP relay agent does not support authorized ARP.

Example # Configure Ethernet 1/0 to support authorized ARP.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp update arp
```

display dhcp relay

Syntax **display dhcp relay** { **all** | **interface** *interface-type interface-number* }

View Any view

Parameter **all**: Displays information of DHCP server groups that all interfaces correspond to.

interface *interface-type interface-number*: Displays information of the DHCP server group that a specified interface corresponds to.

Description Use the **display dhcp relay** command to display information about DHCP server groups correlated to an interface or all interfaces.

Example # Display information about DHCP server groups correlated to all interfaces.

```
[Sysname] display dhcp relay all
    Interface name            Server-group
    Ethernet1/1                   2
```

Table 131 Description on fields of the display dhcp relay all command

Field	Description
Interface name	Interface name
Server-group	DHCP server group number correlated to the interface.

display dhcp relay security

Syntax **display dhcp relay security** [*ip-address* | **dynamic** | **static**]

View Any view

Parameter *ip-address*: Displays the binding information of an IP address.

dynamic: Displays information about dynamic bindings.

static: Displays information about static bindings.

Description Use the **display dhcp relay security** command to display information about bindings of DHCP relay agents. If no parameter is specified, information about all bindings will be displayed.

Example # Display information about all bindings.

```
<Sysname> display dhcp relay security
IP Address      MAC Address     Type       Interface
 10.1.1.1       00e0-0000-0001  Static     Eth1/0
 10.1.1.5       00e0-0000-0000  Static     Vlan2
---   2 dhcp-security item(s) found   ---
```

Table 132 Description on fields of the display dhcp relay security command

Field	Description
IP Address	Client IP address
MAC Address	Client MAC address
Type	Type of binding, including dynamic and static
Interface	Layer 3 interface connecting to the DHCP client. If no interface is recorded in the binding entry, "N/A" is displayed.

display dhcp relay security statistics

Syntax **display dhcp relay security statistics**

View Any view

Parameter None

Description Use the **display dhcp relay security statistics** command to display statistics information about bindings of DHCP relay agents.

Example # Display statistics about client address binding entries.

```
<Sysname> display dhcp relay security statistics
Static Items      :1
Dynamic Items     :0
Temporary Items   :0
All Items          :1
```

Table 133 Description on fields of the display dhcp relay security statistics command

Field	Description
Static Items	Static client address binding items
Dynamic Items	Dynamic client address binding items
Temporary Items	Temporary client address binding items
All Items	All client address binding items

display dhcp relay security tracker

Syntax **display dhcp relay security tracker**

View Any view

Parameter None

Description Use the **display dhcp relay security tracker** command to display the interval for refreshing dynamic bindings on the relay agent.

Example # Display the interval for refreshing dynamic bindings on the relay agent.

```
[Sysname] display dhcp relay security tracker
Current tracker interval : Auto
```

The interval is 10 seconds.

display dhcp relay server-group

Syntax **display dhcp relay server-group** { *group-id* | **all** }

View Any view

Parameter *group-id*: Displays the information of the specified DHCP server group numbered from 0 to 19.

all: Displays the information of all DHCP server groups.

Description Use the **display dhcp relay server-group** command to display the configuration information of a specified or all DHCP server groups.

Example # Display IP addresses of DHCP servers in DHCP server group 1.

```
<Sysname> display dhcp relay server-group 1
    No.             Group IP
    1               1.1.1.1
    2               1.1.1.2
```

Table 134 Description on fields of the display dhcp relay server-group command

Field	Description
No.	Sequence number
Group IP	IP address in the server group

display dhcp relay statistics

Syntax **display dhcp relay statistics** [**server-group** { *group-id* | **all** }]

View Any view

Parameter *group-id*: Specifies a server group number in the range of 0 to 19 about which to display DHCP packet statistics.

all: Specifies all server groups about which to display DHCP packet statistics. Information for each group will be displayed.

Description Use the **display dhcp relay statistics** command to display DHCP packet statistics related to a specified or all DHCP server groups.

Note that if no parameter (**server-group** and **all)** is specified, all DHCP packet statistics on the relay agent will be displayed.

Example # Display all DHCP packet statistics on the relay agent.

```
<Sysname> display dhcp relay statistics
     Bad packets received:                  0
     DHCP packets received from clients:    20
         DHCPDISCOVER packets received:     10
         DHCPREQUEST packets received:      10
         DHCPINFORM packets received:       0
         DHCPRELEASE packets received:      0
         DHCPDECLINE packets received:      0
         BOOTPREQUEST packets:              0
     DHCP packets received from servers:    20
         DHCPOFFER packets received:        10
         DHCPACK packets received:          10
         DHCPNAK packets received:          0
         BOOTPREPLY packets:                0
     DHCP packets sent to servers:          20
     DHCP packets sent to clients:          20
```

Display DHCP packet statistics related to every server group on the relay agent.

```
<Sysname> display dhcp relay statistics server-group all
 DHCP relay server-group           #2
     Packet type               Packet number
 Client -> Server:
     DHCPDISCOVER                  5
     DHCPREQUEST                   5
     DHCPINFORM                        0
     DHCPRELEASE                   0
     DHCPDECLINE                   0
     BOOTPREQUEST                  0
 Server -> Client:
     DHCPOFFER                     5
     DHCPACK                       5
     DHCPNAK                       0
     BOOTPREPLY                    0

 DHCP relay server-group           #3
     Packet type               Packet number
 Client -> Server:
     DHCPDISCOVER                  5
     DHCPREQUEST                   5
     DHCPINFORM                        0
     DHCPRELEASE                   0
     DHCPDECLINE                   0
     BOOTPREQUEST                  0
 Server -> Client:
     DHCPOFFER                     5
     DHCPACK                       5
     DHCPNAK                       0
     BOOTPREPLY                    0
```

reset dhcp relay statistics

Syntax **reset dhcp relay statistics** [**server-group** *group-id*]

View User view

Parameter **server-group** *group-id*: Specifies a server group ID in the range of 0 to 19 about which to remove statistics from the relay agent.

Description Use the **reset dhcp relay statistics** command to remove statistics from the relay agent.

If no **server-group** is specified, all statistics will be removed from the relay agent.

Related command: **display dhcp relay statistics**.

Example # Remove all statistics from the DHCP relay agent.

```
<Sysname> reset dhcp relay statistics
```

53 DHCP CLIENT CONFIGURATION COMMANDS

- *The DHCP client configuration is supported only on the Layer 3 Ethernet interface (or subinterface) and VLAN interface.*
- *When multiple VLAN interfaces having the same MAC address use DHCP for IP address acquisition via a relay agent, the DHCP server cannot be the Windows 2000 Server or Windows 2003 Server.*
- *You are not recommended to enable both the DHCP client and the DHCP Snooping on the same device. Otherwise, DHCP Snooping entries may fail to be generated, or the DHCP client may fail to obtain an IP address.*

display dhcp client

Syntax **display dhcp client** [**verbose**] [**interface** *interface-type interface-number*]

View Any view

Parameter **verbose**: Specifies verbose DHCP client information to be displayed.

interface *interface-type interface-number*: Specifies an interface of which to display DHCP client information.

Description Use the **display dhcp client** command to display DHCP client information. If no **interface** *interface-type interface-number* is specified, DHCP client information of all interfaces will be displayed.

Example # Display DHCP client information of all interfaces.

```
<Sysname> display dhcp client
Vlan-interface1 DHCP client information:
 Current machine state: BOUND
 Allocated IP: 40.1.1.20 255.255.255.0
 Allocated lease: 259200 seconds, T1: 129600 seconds, T2: 226800 seconds
 DHCP server: 40.1.1.2
```

Display verbose DHCP client information.

```
<Sysname> display dhcp client verbose
Vlan-interface1 DHCP client information:
 Current machine state: BOUND
 Allocated IP: 40.1.1.20 255.255.255.0
 Allocated lease: 259200 seconds, T1: 129600 seconds, T2: 226800 seconds
 Lease from 2005.08.13 15:37:59   to   2005.08.16 15:37:59
 DHCP server: 40.1.1.2
 Transaction ID: 0x1c09322d
 Default router: 40.1.1.2
```

```
 DNS server: 44.1.1.11
 DNS server: 44.1.1.12
 Domain name: ddd.com
Boot server: 200.200.200.200  1.1.1.1
Client ID: 3030-3066-2e65-3234-
           392e-3830-3438-2d56-
           6c61-6e2d-696e-7465-
           7266-6163-6531
T1 will timeout in 1 day 11 hours 58 minutes 52 seconds.
```

Table 135 Description on fields of the display dhcp client command

Field	Description
Vlan-interface1 DHCP client information	Information of the interface acting as the DHCP client
Current machine state	DHCP client current machine state
Allocated IP	The IP address allocated by the DHCP server
Allocated lease	The allocated lease time
T1	The 1/2 lease time (in seconds) of the DHCP client IP address
T2	The 7/8 lease time (in seconds) of the DHCP client IP address
Lease from....to....	The start and end time of the lease.
DHCP Server	DHCP server IP address that assigned the IP address
Transaction ID	Transaction ID, a random number chosen by the client to identify an IP address allocation.
Default router	The gateway address assigned to the client
DNS server	The DNS server address assigned to the client
Domain name	The domain name suffix assigned to the client
Boot server	PXE server addresses (up to 16 addresses) specified for the DHCP client, which are obtained through Option 43.
Client ID	Client ID
T1 will timeout in 1 day 11 hours 58 minutes 52 seconds.	How long the T1 (1/2 lease time) timer will timeout.

ip address dhcp-alloc

Syntax **ip address dhcp-alloc** [**client-identifier mac** *interface-type interface-number*]

undo ip address dhcp-alloc

View Interface view

Parameter **client-identifier mac** *interface-type interface-number*: Specifies the MAC address of an interface using which as the client ID to obtain an IP address.

Description Use the **ip address dhcp-alloc** command to configure an interface to use DHCP for IP address acquisition.

Use the **undo ip address dhcp-alloc** command to cancel an interface from using DHCP.

By default, an interface does not use DHCP for IP address acquisition.

Note that:

- If no parameter is specified, the client uses a character string comprised of the current interface name and MAC address as its ID for address acquisition.
- The DHCP client sends a DHCP-RELEASE message for releasing the IP address obtained via DHCP, if the interface of the client is down, the message cannot be sent.
- For a sub interface that obtained an IP address via DHCP, using the **shutdown** command on its primary interface does not make the DHCP client send a DHCP-RELEASE message for releasing the sub interface's IP address.

Example # Configure interface Ethernet 1/0 to use DHCP for IP address acquisition.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip address dhcp-alloc
```

- *The DHCP snooping is supported only on the Layer 2 Ethernet interface.*
- *DHCP Snooping supports no link aggregation. If a Layer 2 Ethernet interface is added into an aggregation group, DHCP Snooping configuration on it will not take effect. When the interface is removed from the group, DHCP Snooping can take effect.*
- *The DHCP snooping enabled device does not work if it is between the DHCP relay agent and DHCP server, and it can work when it is between the DHCP client and relay agent or between the DHCP client and server.*
- *The DHCP Snooping enabled device cannot be a DHCP server or DHCP relay agent.*
- *You are not recommended to enable the DHCP client, BOOTP client, and DHCP Snooping on the same device. Otherwise, DHCP Snooping entries may fail to be generated, or the BOOTP client/DHCP client may fail to obtain an IP address.*

Only the H3C MSR series routers installed with the 16-port or 24-port switching card support DHCP snooping.

54 DHCP SNOOPING CONFIGURATION COMMANDS

dhcp-snooping

Syntax **dhcp-snooping**

undo dhcp-snooping

View System view

Parameter None

Description Use the **dhcp-snooping** command to enable DHCP snooping.

Use the **undo dhcp-snooping** command to disable DHCP snooping.

With DHCP snooping disabled, all ports can forward responses from any DHCP servers and does not record binding information about MAC addresses of DHCP clients and the obtained IP addresses.

By default, DHCP snooping is disabled.

Related command: **display dhcp-snooping**.

Example # Enable DHCP snooping.

```
[Sysname] dhcp-snooping
```

dhcp-snooping trust

Syntax **dhcp-snooping trust**

undo dhcp-snooping trust

View Layer 2 Ethernet interface view

Parameter None

Description Use the **dhcp-snooping trust** command to set a port as trusted.

Use the **undo dhcp-snooping trust** command to restore the default state of a port.

All ports are untrusted by default.

Related command: **display dhcp-snooping trust**.

Example # Set port Ethernet 1/0 as trusted.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] dhcp-snooping trust
```

display dhcp-snooping

Syntax **display dhcp-snooping**

View Any view

Parameter None

Description Use the **display dhcp-snooping** command to display the binding information recorded through DHCP snooping.

Related command: **dhcp-snooping**.

*Using the display **dhcp-snooping** command displays IP-to-MAC bindings that are present both in the DHCP-ACK and DHCP-REQUEST messages.*

Example # Display DHCP snooping address binding information.

```
<Sysname> display dhcp-snooping
 DHCP Snooping is enabled.
 The client binding table for all untrusted ports.
 Type : D--Dynamic , S--Static
 Type   IP Address       MAC Address         Lease          VLAN     Interface
 ====   ===============  ===============     ========== ==== =================
 D     10.1.1.1              00e0-fc00-0006   286   1    Ethernet1/0
 ---   1 dhcp-snooping item(s) found   ---
```

Table 136 Description on fields of the display dhcp snooping command

Field	Description
Type	Binding type
IP Address	IP address assigned to the DHCP client
MAC Address	MAC address of the DHCP client
Lease	Lease period of the IP address in seconds
VLAN	VLAN where the port connecting the DHCP client resides
Interface	Port to which the DHCP client is connected

display dhcp-snooping trust

Syntax **display dhcp-snooping trust**

View Any view

Parameter None

Description Use the **display dhcp-snooping trust** command to display information about trusted ports.

Related command: **dhcp-snooping trust**.

Example # Display information about trusted ports.

```
<Sysname> display dhcp-snooping trust
 DHCP Snooping is enabled.
 DHCP Snooping trust becomes active.
 Interface                                   Trusted
 ========================                  ============
 Ethernet1/0                                 Trusted
```

The above output shows that DHCP snooping is enabled, DHCP snooping trust is active, and port Ethernet 1/0 is trusted.

55 BOOTP CLIENT CONFIGURATION COMMANDS

- *BOOTP client configuration can only be used on Layer 3 Ethernet interfaces (including sub-interfaces) and VLAN interfaces.*
- *If several VLAN interfaces sharing the same MAC address obtain IP addresses through a BOOTP relay agent, the BOOTP server cannot be a Windows 2000 Server or Windows 2003 Server.*
- *You are not recommended to enable both the DHCP client and the DHCP Snooping on the same device. Otherwise, DHCP Snooping entries may fail to be generated, or the BOOTP client may fail to obtain an IP address.*

CAUTION: *The support for the DHCP Snooping function varies with devices.*

display bootp client

Syntax **display bootp client** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Displays the BOOTP client information of the interface.

Description Use the **display bootp client** command to display related information about a BOOTP client.

Note:

- If **interface** *interface-type interface-number* is not specified, the command will display information about BOOTP clients on all interfaces.
- If **interface** *interface-type interface-number* is specified, the command will display information about the BOOTP client on the specified interface.

Example # Display related information about the BOOTP client on Ethernet1/0.

```
<Sysname> display bootp client interface ethernet 1/0
Ethernet1/0 BOOTP client information:
Allocated IP: 169.254.0.2 255.255.0.0
Transaction ID = 0x3d8a7431
Mac Address  00e0-fc0a-c3ef
```

Table 137 Description on fields of the display bootp client command

Field	Description
Ethernet1/0 BOOTP client information or Vlan-interface1 BOOTP client information	Information of the interface serving as a BOOTP client
Allocated IP	BOOTP client's IP address allocated by the BOOTP server
Transaction ID	Value of the **XID** field in a BOOTP message, namely, a random number used to match a response message from the BOOTP server while the BOOTP client sends a BOOTP request to the BOOTP server. If the values of the **XID** field are different in the BOOTP response and request, the BOOTP client will drop the BOOTP response.
Mac Address	MAC address of a BOOTP client

ip address bootp-alloc

Syntax **ip address bootp-alloc**

undo ip address bootp-alloc

View Interface view

Parameter None

Description Use the **ip address bootp-alloc** command to enable an interface to obtain an IP address through BOOTP.

Use the **undo ip address bootp-alloc** command to disable the interface from obtaining an IP address through BOOTP.

By default, an interface does not obtain an IP address through BOOTP.

Related command: **display bootp client**.

Example # Configure Ethernet1/0 to obtain an IP address through BOOTP.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip address bootp-alloc
```

56 DHCP DEBUGGING COMMANDS

debugging dhcp server

Syntax **debugging dhcp server { all | error | event | packet }**

undo debugging dhcp server { all | error | event | packet }

View User view

Default Level 1: Monitor level

Parameters **all**: All types of debugging for DHCP server.

error: DHCP server error debugging.

event: DHCP server event debugging.

packet: DHCP server packet debugging.

Description Use the **debugging dhcp server** command to enable DHCP server debugging.

Use the **undo debugging dhcp server** command to disabled DHCP server debugging.

By default, DHCP server debugging is disabled.

Table 138 Description on the fields of the debugging dhcp server packet command

Field	Description
Rx/Tx	Receiving/sending operation
Interface *InterfaceName*	Receiving interface
Message type: *MessageType*	DHCP message type, that is, request or reply.
Hardware type: *HardwareType*	Hardware type of the DHCP client
Hardware address length: *HardwareAddressLength*	Hardware address length of the DHCP client
Hops: *Hops*	Hops that a DHCP message traveled
Transaction ID: *TransactionID*	A random number generated when the DHCP client initiates an application, which uniquely identifies an application process.
Seconds: *Seconds*	Time elapsed since the DHCP client initiated the application. It is not used currently, and its value is set to 0.

Table 138 Description on the fields of the debugging dhcp server packet command

Field	Description
Broadcast flag: *BroadcastFlag*	DHCP broadcast flag: 1 refers to broadcast, and 0 refers to unicast.
Your IP address: *YourIPAddress*	IP address that the DHCP server assigns to the client
Boot file name: *BootFileName*	Boot file name and path
DHCP message type: *DHCPmessagetype*	DHCP message type, which can be: ■ DHCP Discover ■ DHCP Offer ■ DHCP Request ■ DHCP Decline ■ DHCP ACK ■ DHCP NAK ■ DHCP Release ■ DHCP Inform

Table 139 Description on the fields of the debugging dhcp server event command

Field	Description
Sending ICMP ECHOREQUEST to target IP: *ip-address*.	An ICMP request is sent to verify whether the IP address is being used.
ICMP still need to detect for *time(s)* time(s).	The times for sending ICMP packets to detect the lease
Send *Message-Type* to *clientID/MAC* Offer IP=> *ip-address* via *ip-address*.	Succeeded in sending the DHCP packet
Failed to send *Message-Type* to *clientID/MAC*.	Failed to send the DHCP packet
Find manual binding lease successfully.	A static binding entry is found.
Assign *Lease-Type* Lease from global pool.	Assign a lease from the global address pool. The lease type can be Used, Free, and Timeout.
Reclaim conflicted IP Address from global pool.	Assign a lease from conflicted IP addresses in the global address pool
Lease is exhausted!	The lease duration expires.
Acknowledge the DHCPREQUEST message!	The DHCP server returns an ACK message and assigns the requested IP address to the client.
Deny DHCPREQUEST message!	The DHCP server returns an NAK message and does not assign the requested IP address to the client.

Table 140 Description on the fields of the debugging dhcp server error command

Field	Description
Dealing with packet failed!	Failed to process the DHCP packet
Decoding DHCP packet failed!	Failed to parse the DHCP packet
ucOp error!	DHCP packet type error
Building option failed!	Failed to create an option
No free buffer for option!	No free buffer space to create options
Deleting lease failed when manual binding!	Failed to delete the lease when configuring a static binding entry

Table 140 Description on the fields of the debugging dhcp server error command

Field	Description
Unable to generate *Message-Type* without an analyzed packet!	Failed to generate a packet without a parsed packet
Too many options have been configured!	Failed to generate a packet with too many options configured
Failed to cancel ICMP timer!	Failed to cancel the timer for sending ICMP packets
Failed to add ICMP timer!	Failed to add the timer for sending ICMP packets
Can not offer new IP without analyzed packet!	Failed to offer IP lease without the parsed packet
Fault occurs in DHCP Sever time interval!	The interval at which the DHCP server waits for client's response expires.

Examples # Configure DHCP server on the device, and enable all types of debugging for DHCP server. The DHCP client applies for IP address from the DHCP sever via a DHCP relay agent.

undo debugging dhcp relay { **all** | **error** | **event** | **packet** [**client mac** *mac-address*] }

View User view

Default Level 1: Monitor level

Parameters **all**: All types of debugging for DHCP relay agent.

error: DHCP relay agent error debugging.

event: DHCP relay agent event debugging.

packet: DHCP relay agent packet debugging.

client mac *mac-address*: Debugging for packets that the DHCP relay agent forwards for a specific DHCP client. *mac-address* is the MAC address of the DHCP client, in the format of H-H-H.

Description Use the **debugging dhcp relay** command to enable DHCP relay agent debugging.

Use the **undo debugging dhcp relay** command to disable DHCP relay agent debugging.

By default, DHCP relay agent debugging is disabled.

Table 141 Description on the fields of the debugging dhcp relay packet command

Field	Description
RX/TX, *Message-Type*, interface *interfacename*.	Receiving or forwarding the message of the *Message-Type* type through the interface *interfacename*
Message type: *MessageType*	Content of the first byte in the DHCP message, that is, the DHCP message type, request or reply.

Table 141 Description on the fields of the debugging dhcp relay packet command

Field	Description
Hardware type: *HardwareType*	Hardware address type of the DHCP client. 1 refers to Ethernet type.
Your IP address: *YourIPAddress*	IP address that the DHCP server assigns to the client
DHCP message type: *DHCPmessagetype*	DHCP message type, which can be: ■ DHCP Discover ■ DHCP Offer ■ DHCP Request ■ DHCP Decline ■ DHCP ACK ■ DHCP NAK ■ DHCP Release ■ DHCP Inform

Table 142 Description on the fields of the debugging dhcp relay event command

Field	Description
interface	Forwarding interface configured with DHCP relay agent
CHardAddr	Hardware address of the DHCP client
Requesting security module(s) to delete all *entry-type* security entries succeeded.	Succeeded in requesting the security module(s) to delete all *entry-type* security entries. The *entry-type* can be dynamic or static.

Table 143 Description on the fields of the debugging dhcp relay error command

Field	Description
Dealing with option 82 failed!	Failed to process Option 82
Option82: parameter error!	Option number error of Option 82
Decoding DHCP packet failed!	Failed to parse the DHCP packet
Discard a BOOTP request packet because of too large hop count!	The hop count of the DHCP message reaches the maximum, and the message will be discarded.

Examples # The DHCP client obtains IP address from the DHCP server via a DHCP relay agent. Enable all types of debugging for the DHCP relay agent.

debugging dhcp client

Syntax **debugging dhcp client** { **all** | **error** | **event** | **packet** }

undo debugging dhcp client { **all** | **error** | **event** | **packet** }

View User view

Default Level 1: Monitor level

Parameters **all**: All types of debugging for DHCP/BOOTP clients.

error: Error debugging or debugging for unknown packets of DHCP/BOOTP clients.

event: DHCP/BOOTP client event debugging.

packet: DHCP/BOOTP client packet debugging.

Description Use the **debugging dhcp client** command to enable DHCP/BOOTP client debugging.

Use the **undo debugging dhcp client** command to disable DHCP/BOOTP client debugging.

By default, the DHCP/BOOTP client debugging is disabled.

Table 144 Description on the fields of the debugging dhcp client packet command

Field	Description
InterfaceName: *operation*	Forwarding interface of the DHCP client
Head :	DHCP packet header
op(*operation-number*)	DHCP message type, where 1 refers to BOOTP request, and 2 refers to BOOT reply.
yiaddr(*YourIPAddress*)	IP address that the DHCP server assigns to the client
OptionsÔºö	Options field of the DHCP message, displayed in the original data format

Table 144 Description on the fields of the debugging dhcp client packet command

Field	Description
Decode option 43:	Original data in Option 43 of the received DHCP message
type(*DHCPmessagetype*)	DHCP message type, which can be: ■ DHCP Offer ■ DHCP ACK ■ DHCP NAK
mask(*subnet mask IP*)	Subnet mask assigned by the DHCP server
lease(*lease*)	Lease assigned by the DHCP server (in seconds)
T1Ô°à*T1*Ô°â	1/2 of the DHCP client's lease (in seconds)
T2Ô°à*T2*Ô°â	7/8 of the DHCP client's lease (in seconds)
server(*server-IP*)	IP address of the DHCP server that sends the packet
dns(*dns-server-ip*)	Domain name server address that the DHCP server assigns to the client
domain(*domain-name*)	Domain name suffix that the DHCP server assigns to the client
Boot server(*boot-server-ip*)	PXE server address list that the DHCP server assigns to the client with option 43

Table 145 Description on the fields of the debugging dhcp client event command

Field	Description
InterfaceName:	Interface of the DHCP client
FSM state transfer(*state1*-->*state2*) successfully.	The state of the DHCP client is changed from *state1* to *state2*.
Enabling/Disabling DHCP to CPU succeeded!	Succeeded in enabling/disabling the sending of DHCP message to CPU for processing
Notify route to add the default gateway *ip-address*.	Notifies the routing module to add a default route
Notify BIMS to connect: BIMS server ip = *ip-address*., port = *port*, sharekey = *sharekey*.	Notifies the BIMS module that a connection has been established
Move to BOUND state in *millisecond* milliseconds if no arp reply is received.	Changes to BOUND state within *millisecond* milliseconds if no ARP reply is received
Resend *Message-Type* for enough times! Wait for rebinding/Wait for expiring/Move to INIT state..	Finishes *Message-Type* packet retransmission, and waits for the rebinding/expiring state, or go to the INIT state

Table 146 Description on the fields of the debugging dhcp client error command

Field	Description
The interface is not ready!	The forwarding interface is not in the right state.
Can't set SO_SENDDATAIF on dhcp socket!	Failed to set the socket
Sending packet with socket failed!	Failed to send packets through the socket
Bind DHCP socket failure!	Failed to bind DHCP socket
Decoding options field failed!	Failed to parse the options field
Enabling/Disabling DHCP to CPU failed!	Failed to enable/disable the sending of DHCP message to CPU for processing

Table 146 Description on the fields of the debugging dhcp client error command

Field	Description
Warning: Deleting the interface information of specified interface failed!	Failed to delete the user information on the specified interface
Copying socket failed when send release packet!	Failed to copy the socket when sending the release packet
timer expired, but FSM state(*state*) is wrong!	The timer expires, but the current state of the DHCP client is wrong.
Skip parsing the current PXE server TLV in option 43 due to invalid server type.	Skip parsing the current PXE server address list in option 43 due to invalid PXE server type.
Skip parsing the current PXE server TLV in option 43 due to length error.	Skip parsing the current PXE server address list in option 43 due to invalid length of the PXE server address list.
Skip parsing the current PXE server TLV in option 43 due to invalid server number.	Skip parsing the current PXE server address list in option 43 due to invalid PXE server number.
Skip parsing the current PXE server TLV in option 43 due to unknown error.	Skip parsing the current PXE server address list in option 43 due to unknown error.

Examples # The DHCP client obtains IP address from the DHCP server via a DHCP relay agent. Enable all types of debugging for the DHCP client.

```
*0.112375 Sysname DHCPC/7/DHCP_Client:
Vlan-interface2: Receive no arp reply for 22.0.0.2, begin to use the address.
```

// Since no ARP reply is received, the state of the DHCP client is changed to BOUND, and the IP address can be used.

57 DNS CONFIGURATION COMMANDS

This document only covers IPv4 DNS configuration commands. For IPv6 DNS configuration commands, refer to "IPv6 Basics Configuration Commands" on page 829.

display dns domain

Syntax **display dns domain** [**dynamic**]

View Any view

Parameter **dynamic**: Displays the domain name suffixes dynamically obtained through DHCP or other protocols.

Description Use the **display dns domain** command to display the domain name suffixes.

Related command: **dns domain**.

Example # Display domain name suffixes.

```
<Sysname> display dns domain
 Type:
  D:Dynamic    S:Static

No.     Type    Domain-name
1       S       com
```

Table 147 Description on fields of display dns domain command

Field	Description
No	Sequence number
Type	Type of domain name suffix: S represents a statically configured domain name suffix, and D represents a domain name suffix obtained dynamically through DHCP.
Domain-name	Domain name suffix

display dns dynamic-host

Syntax **display dns dynamic-host**

View Any view

Parameter None

Description Use the **display dns dynamic-host** command to display the information in the dynamic domain name resolution cache.

Example # Display the information in the dynamic domain name resolution cache.

```
<Sysname> display dns dynamic-host
No  Host                  IP Address            TTL
1   www.baidu.com         202.108.249.134      63000
2   www.yahoo.akadns.net  66.94.230.39         24
3   www.hotmail.com       207.68.172.239       3585
4   www.eyou.com          61.136.62.70         3591
```

Table 148 Description on the field of the display dns dynamic-host command

Field	Description
No	Sequence number
Host	Domain name
IP Address	IP address for the corresponding domain name
TTL	Time a mapping can be stored in the cache (seconds).

*The domain-name field in the **display dns dynamic-host** command contains 21 characters at most. If a resolved domain name consists of more than 21 characters, only the first 21 characters are displayed.*

display dns proxy table

Syntax **display dns proxy table**

View Any view

Parameters None

Description Use the **display dns proxy table** command to display the DNS proxy table.

Examples # Display the DNS proxy table.

```
<Sysname> display dns proxy table
Source IP          Source Port  Trans ID     Server IP          Aging
192.168.0.98       1030         24580        192.168.111.244    35
```

Table 149 Description on the fields of the display dns proxy table command

Field	Description
Source IP	Source IP address of the DNS request, that is, the IP address of the DNS client.
Source Port	Source port number of the DNS request
Trans ID	Transaction ID of the DNS request
Server IP	IP address of the DNS server
Aging	Aging time of the DNS proxy table entry

display dns server

Syntax **display dns server** [**dynamic**]

View Any view

Parameter **dynamic**: Displays the DNS server information dynamically obtained through DHCP or other protocols

Description Use the **display dns server** command to display the DNS server information.

Related command: **dns server**.

Example # Display the DNS server information.

```
<Sysname> display dns server
Type:
  D:Dynamic    S:Static

DNS Server  Type  IP Address
    1       S     169.254.65.125
```

Table 150 Description on fields of the display dns server command

Field	Description
DNS Server	Sequence number of the DNS server. Configured automatically by the device, starting from 1.
Type	Type of domain name server: S represents a statically configured DNS server, and D represents a DNS server obtained dynamically through DHCP.
IP Address	IP address of the DNS server

display ip host

Syntax **display ip host**

View Any view

Parameter None

Description Use the **display ip host** command to display the host names and corresponding IP addresses in the static DNS database.

Example # Display the host names and corresponding IP addresses in the static DNS database.

```
<Sysname> display ip host
Host            Age     Flags       Address
My          0       static      1.1.1.1
Aa          0       static      2.2.2.4
```

Table 151 Description on fields of the display ip host command

Field	Description
Host	Host name
Age	Time to live. 0 means that a static mapping will never age out.
	You can only manually remove the mappings between host names and IP addresses.
Flags	Indicates the type of mappings between host names and IP addresses, static or dynamic.
	Static represents static domain name resolution.
Address	Host IP addresses

dns domain

Syntax **dns domain** *domain-name*

undo dns domain [*domain-name*]

View System view

Parameter *domain-name*: Domain name suffix, which is case-insensitive and consists of character strings separated by a dot (for example, aabbcc.com). Each separated string contains no more than 63 characters. The length of a domain name suffix with dots included is up to 238 characters. Character strings can contain letters, digits, hyphens (-), underscores (_), and dots (.).

Description Use the **dns domain** command to configure a domain name suffix.

Use the **undo dns domain** command to delete a domain name suffix (with a domain name suffix specified) or all domain name suffixes (with no domain name suffix specified).

No domain name suffix is configured by default.

You can configure a maximum of 10 domain name suffixes.

Related command: **display dns domain**.

Example # Configure com as a DNS suffix.

```
[Sysname] dns domain com
```

dns proxy enable

Syntax **dns proxy enable**

undo dns proxy enable

View System view

Parameters None

Description Use the **dns proxy enable** command to enable DNS proxy.

Use the **undo dns proxy enable** command to disable DNS proxy.

By default, DNS proxy is disabled.

Examples # Enable DNS proxy.

```
<Sysname> system-view
[Sysname] dns proxy enable
```

dns resolve

Syntax **dns resolve**

undo dns resolve

View System view

Parameter None

Description Use the **dns resolve** command to enable dynamic domain name resolution.

Use the **undo dns resolve** command to disable dynamic domain name resolution.

Dynamic domain name resolution is disabled by default.

Example # Enable dynamic domain name resolution.

```
[Sysname] dns resolve
```

dns server

Syntax **dns server** *ip-address*

undo dns server [*ip-address*]

View System view

Parameter *ip-address*: IP address of the DNS server.

Description Use the **dns server** command to configure an IP address for the DNS server.

Use the **undo dns server** to remove the IP address.

No IP address is configured for the DNS server by default.

You can configure a maximum of six DNS servers.

Related command: **display dns server**.

For details about IPv6 DNS, refer to "IPv6 Basics Configuration Commands" on page 829.

Example # Configure 172.16.1.1 for the DNS server.

```
[Sysname] dns server 172.16.1.1
```

ip host

Syntax **ip host** *hostname ip-address*

undo ip host *hostname* [*ip-address*]

View System view

Parameter *Hostname*: Host name, consisting of 1 to 20 characters, including case-insensitive letters, numbers, hyphens (-), or dots (.). The host name must include at least one letter.

ip-address: IP address of the specified host in dotted decimal notation.

Description Use the **ip host** command to create a mapping between host name and IP address in the static resolving list.

Use the **undo ip host** command to remove the mapping.

No mappings are created by default.

You can configure only one mapping between IP address and host name. For example, a mapping configured last time will overwrite the previous one if there is any.

Related command: **display ip host**.

Example # Configure the IP address 10.110.0.1 for a host named **aaa**.

```
[Sysname] ip host aaa 10.110.0.1
```

reset dns dynamic-host

Syntax **reset dns dynamic-host**

View User view

Parameter None

Description Use the **reset dns dynamic-host** command to clear the information in the dynamic domain name cache.

Related command: **display dns dynamic-host**.

Example # Clear the information in the dynamic domain name cache.

```
<Sysname> reset dns dynamic-host
```

58 IP ACCOUNTING CONFIGURATION COMMANDS

display ip count

Syntax **display ip count { inbound-packets | outbound-packets } { exterior | firewall-denied | interior }**

View Any view

Parameter **inbound-packets**: Displays information about incoming IP packets.

outbound-packets: Displays information about outgoing IP packets.

exterior: Displays information about the IP packets in the exterior table. The exterior table records rule-incompliant packets.

firewall-denied: Displays information about denied IP packets.

interior: Displays information about the IP packets in the interior table. The interior table records rule-compliant packets.

If no firewall is configured on the interface, packets refer to all incoming and outgoing IP packets. If a firewall is configured, only those valid packets can pass the firewall.

Description Use the **display ip count** command to display the statistics of the IP accounting about IP packets.

Example # Display information about valid rule-incompliant incoming IP packets.

```
<Sysname> display ip count inbound-packets exterior
6 Inbound streams information in exterior list:
  SrcIP            DstIP               Protocol  Pkts        Bytes
  0.0.0.0          255.255.255.255     UDP       28          9502
  10.153.72.181    10.153.73.255       UDP       174         38034
  10.153.72.137    239.255.255.250     UDP       4           644
  10.153.72.141    224.0.0.2           IGMP      4           128
  10.153.72.141    224.0.0.9           UDP       4           208
  10.153.72.141    224.0.0.9           IGMP      4           128
```

Table 152 Description on the fields of the display ip count command

Field	Description
SrcIP	Source IP address of a packet
DstIP	Destination IP address of a packet

Table 152 Description on the fields of the display ip count command

Field	Description
Protocol	Protocol carried in a packet
Pkts	Number of packets
Bytes	Number of bytes of packets

display ip count rule

Syntax **display ip count rule**

View Any view

Parameter None

Description Use the **display ip count rule** command to display IP accounting rules.

Example # Display IP accounting rules.

```
<Sysname> display ip count rule
 IP Count rule list:
   IP address     address mask
   1.1.1.0         255.255.255.0
   2.0.0.0         255.0.0.0
 -----------------------------------
 Total: 2 rules
```

Table 153 Description on fields of the display ip count rule command

Field	Description
IP address	IP address
address mask	Subnet mask

ip count enable

Syntax **ip count enable**

undo ip count enable

View System view

Parameter None

Description Use the **ip count enable** command to enable IP accounting.

Use the **undo ip count enable** command to disable IP accounting.

By default, IP accounting is disabled.

Example # Enable IP accounting.

```
<Sysname> system-view
[Sysname] ip count enable
```

ip count exterior-threshold

Syntax **ip count exterior-threshold** *number*

undo ip count exterior-threshold

View System view

Parameter *number*: Maximum number of accounting entries in the exterior table, in the range of 0 to 8,192.

Description Use the **ip count exterior-threshold** command to configure the maximum number of accounting entries in the exterior table.

Use the **undo ip count exterior-threshold** command to restore the default. When doing this, you are prompted to clear the table first if any accounting entries already exist in the table.

By default, the maximum number of accounting entries in the exterior table is 0. Rule-incompliant packets are not to be counted.

IP packets are sorted as follows:

- If a firewall is configured on an interface and incoming and outgoing IP packets are denied by the firewall, these IP packets are counted in the firewall-denied table.
- If the source or destination IP address of the IP packets passing the interface (in this case, a firewall may be configured or not) matches a network address in the IP accounting rule, the packets are recorded in the interior table. Otherwise, the packets are counted in the exterior table.

Example # Set the maximum number of accounting entries in the exterior table to 100.

```
<Sysname> system-view
[Sysname] ip count exterior-threshold 100
```

ip count firewall-denied

Syntax **ip count firewall-denied** { **inbound-packets** | **outbound-packets** }

undo ip count firewall-denied { **inbound-packets** | **outbound-packets** }

View Interface view

Parameter **inbound-packets**: Counts the incoming IP packets denied by the firewall on the current interface.

outbound-packets: Counts the outgoing IP packets denied by the firewall on the current interface.

Description Use the **ip count firewall-denied** command to count the IP packets denied by the firewall on the current interface.

Use the **undo ip count firewall-denied** command to restore the default.

By default, IP packets denied by the firewall are not counted.

Information about counted firewall-denied IP packets is stored in the firewall-denied table.

Example # Count the outgoing IP packets denied by the firewall on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip count firewall-denied outbound-packets
```

Specify not to count the outbound IP packets denied by the firewall on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] undo ip count firewall-denied outbound-packets
```

ip count inbound-packets

Syntax **ip count inbound-packets**

undo ip count inbound-packets

View Interface view

Parameter None

Description Use the **ip count inbound-packets** command to count incoming IP packets on the current interface.

Use the **undo ip count inbound-packets** command to restore the default.

By default, incoming IP packets on the interface are not counted.

After you execute the **ip count inbound-packets** command in interface view, the incoming IP packets are stored in the exterior or interior table, depending on whether they match the IP accounting rules.

If no firewall is configured on the interface, valid packets refer to all incoming and outgoing IP packets. If a firewall is configured, valid packets refer to only those passing the firewall.

Example # Count incoming IP packets on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip count inbound-packets
```

Specify not to count incoming IP packets on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] undo ip count inbound-packets
```

ip count interior-threshold

Syntax **ip count interior-threshold** *number*

undo ip count interior-threshold

View System view

Parameter *number*: Maximum number of accounting entries in the interior table, in the range 0 to 16,384.

Description Use the **ip count interior-threshold** command to configure maximum number of accounting entries in the interior table.

Use the **undo ip count interior-threshold** command to restore the default. When doing this, you are prompted to clear the table first if the number of accounting entries in the table is greater than the default.

By default, maximum number of accounting entries in the interior table is 512.

IP packets are sorted as follows:

- If a firewall is configured on an interface and incoming and outgoing IP packets are denied by the firewall, these IP packets are recorded in the firewall-denied table.
- If the source or destination IP address of the IP packets passing the interface (in this case, a firewall may be configured or not) matches a network address in the IP accounting rule, the packets are recorded in the interior table. Otherwise, the packets are recorded in the exterior table.

Example # Set maximum number of accounting entries in the interior table to 1,000.

```
<Sysname> system-view
[Sysname] ip count interior-threshold 1000
```

ip count outbound-packets

Syntax **ip count outbound-packets**

undo ip count outbound-packets

View Interface view

Parameter None

Description Use the **ip count outbound-packets** command to count outgoing IP packets on the current interface.

Use the **undo ip count outbound-packets** command to restore the default.

By default, outgoing IP packets on the interface are not counted.

You can execute this command in interface view to count outgoing IP packets, which will be stored in the exterior table or interior table, depending on whether they match the accounting rules.

Example # Count outgoing IP packets on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip count outbound-packets
```

ip count rule

Syntax **ip count rule** *ip-address* { *mask* | *mask-length* }

undo ip count rule {*ip-address* { *mask* | *mask-length* }]

View System view

Parameter *ip-address*: IP address.

mask: Subnet mask.

mask-length: Length of a subnet mask, in the range of 0 to 32.

Description Use the **ip count rule** command to create an IP accounting rule.

Use the **undo ip count rule** command to remove the specified accounting rule. All IP accounting rules will be deleted if no parameter is specified.

Each IP accounting rule consists of an IP address and its mask, namely, a network address, which is the result of ANDing the IP address with its mask. IP packets are sorted as follows:

- If a firewall is configured on an interface and incoming and outgoing IP packets are denied by the firewall, these IP packets are counted in the firewall-denied table.
- If the source or destination IP address of the IP packets passing the interface (in this case, a firewall may be configured or not) matches a network address in the rule, the packets are counted in the interior table. Otherwise, the packets are counted in the exterior table.

Note that:

- You can configure up to 32 rules.
- If no rule is configured, the current packets are not concerned and are all counted in the exterior table.

Example # Create an IP accounting rule.

```
<Sysname> system-view
[Sysname] ip count rule 169.254.10.1 255.255.0.0
```

ip count timeout

Syntax **ip count timeout** *minutes*

undo ip count timeout

View System view

Parameter *minutes*: Aging time in minutes for an accounting entry, in the range of 60 to 10,080.

Description Use the **ip count timeout** command to configure aging time for an IP accounting entry.

Use the **undo ip count timeout** command to restore the default.

By default, the aging time for an accounting entry is 720 minutes, namely, 12 hours.

If an accounting entry is not updated before its aging time expires, the entry is considered expired and then deleted.

Example # Set the aging time for an IP accounting entry to 100 minutes.

```
<Sysname> system-view
[Sysname] ip count timeout 100
```

reset ip count

Syntax **reset ip count** { **all** | **exterior** | **firewall** | **interior** }

View User view

Parameter **all:** Clears all statistics.

firewall: Clears the statistics from the firewall-denied table.

exterior: Clears the statistics from the exterior table.

interior: Clears the statistics from the interior table.

Description Use the **reset ip count** command to clear the statistics of IP packets.

Example # Clear the statistics of all IP packets.

```
<Sysname> reset ip count all
```

59 IP ADDRESSING CONFIGURATION COMMANDS

display ip interface

Syntax **display ip interface** [*interface-type interface-number*]

View Any view

Parameter *interface-type interface-number*: Specifies an interface by its type and number.

Description Use the **display ip interface** command to display information about a specified or all Layer 3 interfaces.

Example # Display detailed information about IP for interface Ethernet 1/0.

```
<Sysname> display ip interface ethernet 1/0
Ethernet1/0 current state : DOWN
Line protocol current state : DOWN
Internet Address is 1.1.1.1/8 Primary
Broadcast address : 1.255.255.255
The Maximum Transmit Unit : 1500 bytes
ip fast-forwarding incoming packets state is Disable
ip fast-forwarding outgoing packets state is Disable
input packets : 0, bytes : 0, multicasts : 0
output packets : 0, bytes : 0, multicasts : 0
ARP packet input number:           0
  Request packet:                  0
  Reply packet:                    0
  Unknown packet:                  0
TTL invalid packet number:         0
ICMP packet input number:          0
  Echo reply:                      0
  Unreachable:                     0
  Source quench:                   0
  Routing redirect:                0
  Echo request:                    0
  Router advert:                   0
  Router solicit:                  0
  Time exceed:                     0
  IP header bad:                   0
  Timestamp request:               0
  Timestamp reply:                 0
  Information request:             0
  Information reply:               0
  Netmask request:                 0
  Netmask reply:                   0
```

```
  Unknown type:                       0
DHCP packet deal mode:  global
```

Table 154 Description on fields of the display ip interface command

Field	Description
current state	Current physical state of an interface
Line protocol current state	Current state of the network layer protocol
Internet Address	IP address of an interface followed by: ■ Primary: Identifies a primary IP address, or ■ Sub: Identifies a secondary IP address.
Broadcast address	Broadcast address of the subnet attached to an interface
The Maximum Transmit Unit	Maximum transmission units on an interface
ip fast-forwarding incoming packets state	Enabled/disabled state of fast-forwarding incoming packets on an interface
ip fast-forwarding outgoing packets state	Enabled/disabled state of fast-forwarding outgoing packets on an interface
input packets : 0, bytes : 0, multicasts : 0 output packets : 0, bytes : 0, multicasts : 0	Unicast packets, bytes, and multicast packets received on an interface Unicast packets, bytes, and multicast packets sent on an interface
ARP packet input number: 0 Request packet: 0 Reply packet: 0 Unknown packet: 0	Total number of ARP packets received on an interface, including ■ ARP request packets ■ ARP reply packets ■ Unknown packets
TTL invalid packet number	Number of TTL-invalid packets received on an interface
ICMP packet input number: 0 Echo reply: 0 Unreachable: 0 Source quench: 0 Routing redirect: 0 Echo request: 0 Router advert: 0 Router solicit: 0 Time exceed: 0 IP header bad: 0 Timestamp request: 0 Timestamp reply: 0 Information request: 0 Information reply: 0 Netmask request: 0 Netmask reply: 0 Unknown type: 0	Total number of ICMP packets received on an interface, including the following packets: ■ Echo reply packet ■ Unreachable packets ■ Source quench packets ■ Routing redirect packets ■ Echo request packets ■ Router advertisement packets ■ Router solicitation packets ■ Time exceeded packets ■ IP header bad packets ■ Timestamp request packets ■ Timestamp reply packets ■ Information request packets ■ Information reply packets ■ Netmask request packets ■ Netmask reply packets ■ Unknown type packets

Table 154 Description on fields of the display ip interface command

Field	Description
DHCP packet deal mode	DHCP packet processing mode. This field appears on a DHCP-supporting device and can be one of the following values: ■ global: The DHCP server with the global address pool is enabled on the interface. ■ relay: The DHCP relay agent is enabled on the interface.

display ip interface brief

Syntax **display ip interface brief** [*interface-type* [*interface-number*]]

View Any view

Parameter *interface-type*: Interface type.

interface-number: Interface number.

Description Use the **display ip interface brief** command to display brief information about a specified or all Layer 3 interfaces.

Without the interface type and interface number specified, information about all layer 3 interfaces is displayed; with only the interface type specified, the information about all layer 3 interfaces of the specified type is displayed; with both the interface type and interface number specified, only the information about the specified interface is displayed.

Note that:

If you have configured the time slots of a CE1/PRI or CT1/PRI interface as an ISDN PRI group using the **pri-set** command, then executing the **display ip interface brief** command only displays the time slot used by the control channel (D channel), instead of the ones used by the user channels (B channels). For details about CE1/PRI and CT1/PRI interfaces, refer to "Fundamental CE1/PRI Interface Configuration Commands" on page 201 and "Fundamental CT1/PRI Interface Configuration Commands" on page 213.

Related command: **display ip interface**.

*E1/T1 interfaces are time slotted. Using the pri-set command can bind time slots of an E1/T1 interface into an ISDN PRI group, with each time slot corresponding to a serial interface. To make the displayed output simple and clear, only the time slot of the control channel (D channel) is displayed regardless of whether the **display ip interface brief** command has an interface included or not.*

Example # Display brief information about Ethernet 1/0.

```
<Sysname> display ip interface brief ethernet 1/0
*down: administratively down
(s): spoofing
Interface            Physical        Protocol        IP Address
Ethernet1/0       up              up            192.168.0.1
```

Table 155 Description on fields of the display ip interface brief command

Field	Description
*down	The interface is administratively shut down with the **shutdown** command.
(s)	Spoofing attribute of the interface. It indicates that an interface whose network layer protocol is displayed up may have no link present or the link is set up only on demand.
Interface	Interface name
Physical	Physical state of interface
Protocol	Network layer protocol state of interface
IP Address	IP address of interface (if no IP address is configured, "unassigned" is displayed.)

ip address

Syntax **ip address** *ip-address* { *mask* | *mask-length* } [**sub**]

undo ip address [*ip-address* { *mask* | *mask-length* } [**sub**]]

View Interface view

Parameter *ip-address*: IP address of interface, in dotted decimal notation.

mask: Subnet mask in dotted decimal notation.

mask-length: Subnet mask length, the number of consecutive ones in the mask.

sub: Secondary IP address for the interface.

Description Use the **ip address** command to assign an IP address and mask to the interface.

Use the **undo ip address** command to remove all IP addresses.

Use the **undo ip address** *ip-address* { *mask* | *mask-length* } command to remove the primary IP address.

Use the **undo ip address** *ip-address* { *mask* | *mask-length* } **sub** command to remove a secondary IP address.

By default, no IP address is assigned to any interface.

When assigning IP addresses to an interface, consider the following:

- You can assign only one primary IP address to an interface.

- The primary and secondary IP addresses can be located in the same network segment.
- Before removing the primary IP address, remove all secondary IP addresses.
- You can assign a secondary IP address only when the interface is not configured to borrow an IP address through IP unnumbered or obtain one through BOOTP, DHCP, or PPP negotiation.

Related command: **display ip interface**.

Example Assign Ethernet1/0 a primary IP address and a secondary IP address, with the subnet masks both being 255.255.255.0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip address 129.102.0.1 255.255.255.0
[Sysname-Ethernet1/0] ip address 202.38.160.1 255.255.255.0 sub
```

ip address unnumbered

Syntax **ip address unnumbered interface** *interface-type interface-number*

undo ip address unnumbered

View Interface view

Parameter **interface** *interface-type interface-number*: Specifies an interface from which the current interface can borrow an IP address.

Description Use the **ip address unnumbered** command to configure the current interface as IP unnumbered to borrow an IP address from another interface.

Use the **undo ip address unnumbered** command to disable IP unnumbered on the interface.

By default, the interface does not borrow IP addresses from other interfaces.

Example # Configure PPP-encapsulated interface Serial 2/2 to borrow IP address from interface Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface serial 2/2
[Sysname-Serial2/2] ip address unnumbered interface ethernet 1/0
```

60 IP PERFORMANCE CONFIGURATION COMMANDS

display fib

Syntax **display fib** [| { **begin** | **include** | **exclude** } *string* | **acl** *acl-number* | **ip-prefix** *ip-prefix-name*]

View Any view

Parameter **|** { **begin** | **include** | **exclude** } *string*: Displays FIB information in the buffer related to the specified string according to a regular expression.

- The **begin** keyword specifies to display from the first FIB entry that contains the specified string.
- The **include** keyword specifies to display only the FIB entries that include the specified string.
- The **exclude** keyword specifies to display only the FIB entries that do not include the specified string.
- The *string* argument is a case-sensitive string, containing 1 to 256 characters.

acl *acl-number*: Displays FIB information passing a specified ACL numbered from 2000 to 2999.

ip-prefix *ip-prefix-name*: Displays FIB information passing a specified IP prefix list, a string of 1 to 19 characters.

Description Use the **display fib** command to display FIB forward information. If no parameters are specified, all FIB information will be displayed.

Example # Display all FIB information.

```
<Sysname> display fib
FIB Table:
Total number of Routes : 4
Flag:
  U:Useable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Reject   L:Generated by ARP or ESIS

Destination/Mask  Nexthop     Flag  TimeStamp      Interface    Token
10.2.0.0/16       10.2.1.1     U    t[1150900568]  Eth1/0       invalid
10.2.1.1/32       127.0.0.1    HU   t[1150900568]  InLoop0      invalid
127.0.0.0/8       127.0.0.1    U    t[1150623094]  InLoop0      invalid
127.0.0.1/32      127.0.0.1    HU   t[1150623094]  InLoop0      invalid
```

Table 156 Description on the fields of the display fib command

Field	Description
Total number of Routes	Total number of routes in the FIB table
Destination/Mask	Destination address/length of mask
Nexthop	Address of next hop
Flag	Flags of routes: ■ U"-Usable route ■ G"-Gateway route ■ H"-Host route ■ B"-Blackhole route ■ D"-Dynamic route ■ S"-Static route ■ R"-Refused route ■ L"-Route generated by ARP or ESIS
TimeStamp	Time stamp
Interface	Forward interface
Token	LSP index number

Display FIB information passing ACL 2000

```
<Sysname> system-view
[Sysname] acl number 2000
[Sysname-acl-basic-2000] rule permit source 10.2.0.0 0.0.255.255
[Sysname-acl-basic-2000] display fib acl 2000
Route entry matched by access-list 2000:
Summary counts: 2

Flag:
  U:Useable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Reject   L:Generated by ARP or ESIS

Destination/Mask  Nexthop     Flag  TimeStamp      Interface    Token
10.2.0.0/16       10.2.1.1     U    t[1150900568]  Eth1/0       invalid
10.2.1.1/32       127.0.0.1    HU   t[1150900568]  InLoop0      invalid
```

Display all entries that contain the string "127" and start from the first one.

```
<Sysname> display fib | begin 127
Flag:
  U:Useable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Reject   L:Generated by ARP or ESIS

Destination/Mask  Nexthop     Flag  TimeStamp      Interface    Token
10.2.1.1/32       127.0.0.1    HU   t[1150900568]  InLoop0      invalid
127.0.0.0/8       127.0.0.1    U    t[1150623094]  InLoop0      invalid
127.0.0.1/32      127.0.0.1    HU   t[1150623094]  InLoop0      invalid
```

Display FIB information passing the IP prefix list abc0

```
<Sysname> system-view
[Sysname] ip ip-prefix abc0 permit 10.2.0.0 16
[Sysname] display fib ip-prefix abc0
Route Entry matched by prefix-list abc0:
Summary count: 1

Flag:
```

```
  U:Useable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Reject   L:Generated by ARP or ESIS

Destination/Mask  Nexthop     Flag  TimeStamp      Interface    Token
10.2.0.0/16       10.2.1.1     U    t[1150900568]  Eth1/0       invalid
```

display fib ip-address

Syntax **display fib** *ip-address1* [{ *mask1* | *mask-length1* } [*ip-address2* { *mask2* | *mask-length2* } | **longer**] | **longer**]

View Any view

Parameter *ip-address1, ip-address2*: Destination IP address, in dotted decimal notation. *ip-address1* and *ip-address2* together determine an address range for the FIB entries to be displayed.

mask1, mask2: IP address mask.

mask-length1, mask-length2: Length of IP address mask.

longer: Displays FIB entries that match the specified address/mask and have masks longer than or equal to the mask that a user enters. If no masks are specified, FIB entries that match the natural network address and have the masks longer than or equal to the natural mask will be displayed.

Description Use the **display fib** *ip-address* command to display FIB entries that match the specified destination IP address.

Example # Display the FIB entries that match the natural network of 10.1.0.0 and have the masks longer than or equal to the natural mask.

```
<Sysname> display fib 10.1.0.0 longer
  Route Entry Count: 2

 Flag:
  U:Useable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static
  R:Reject   L:Generated by ARP or ESIS

Destination/Mask  Nexthop      Flag   TimeStamp      Interface    Token
10.0.0.0/8        10.1.1.1      U     t[1141140133]  Eth1/0       invalid
10.1.1.1/32       127.0.0.1     HU    t[1141140133]  InLoop0      invalid
```

For description about the above output, refer to Table 156.

display fib statistics

Syntax **display fib statistics**

View Any view

Parameter None

Description Use the **display fib statistics** command to display statistics about the FIB entries.

Example # Display statistics about the FIB entries.

```
<Sysname> display fib statistics
Route Entry Count          : 2
```

Table 157 Description on the fields of the display fib statistics command

Field	Description
Route Entry Count	Number of FIB entries

display icmp statistics

Syntax **display icmp statistics**

View Any view

Parameter None

Description Use the **display icmp statistics** command to display ICMP statistics.

Related command: **display ip interface** and **reset ip statistics**.

Example # Display ICMP statistics.

```
<Sysname> display icmp statistics
  Input: bad formats   0                   bad checksum            0
         echo          5                   destination unreachable 0
         source quench 0                   redirects               0
         echo reply    10                  parameter problem       0
         timestamp     0                   information request     0
         mask requests 0                   mask replies            0
         time exceeded 0
  Output:echo          10                  destination unreachable 0
         source quench 0                   redirects               0
         echo reply    5                   parameter problem       0
         timestamp     0                   information reply       0
         mask requests 0                   mask replies            0
         time exceeded 0
```

Table 158 Description on the fields of the display icmp statistics command

Field	Description
bad formats	Number of input wrong format packets
bad checksum	Number of input wrong checksum packets
echo	Number of input/output echo packets
destination unreachable	Number of input/output destination unreachable packets
source quench	Number of input/output source quench packets
redirects	Number of input/output redirection packets
echo reply	Number of input/output replies

Table 158 Description on the fields of the display icmp statistics command

Field	Description
parameter problem	Number of input/output parameter problem packets
timestamp	Number of input/output time stamp packets
information request	Number of input information request packets
mask requests	Number of input/output mask requests
mask replies	Number of input/output mask replies
information reply	Number of output information reply packets
time exceeded	Number of input/output expiration packets

display ip socket

Syntax **display ip socket** [**socktype** *sock-type*] [*task-id socket-id*]

View Any view

Parameter **socktype** *sock-type*: Displays the socket information of this type. The sock type is in the range 1 to 3, corresponding to TCP, UDP and raw IP respectively.

task-id: Displays the socket information of this task. Task ID is in the range 1 to 100.

socket-id: Displays the information of the socket. Socket ID is in the range 0 to 3072.

Description Use the **display ip socket** command to display socket information.

Example # Display all socket information.

```
<Sysname> display ip socket
SOCK_STREAM:
Task = VTYD(18), socketid = 1, Proto = 6,
LA = 0.0.0.0:23, FA = 0.0.0.0:0,
sndbuf = 8192, rcvbuf = 8192, sb_cc = 0, rb_cc = 0,
socket option = SO_ACCEPTCONN SO_KEEPALIVE SO_SENDVPNID SO_SETKEEPALIVE,
socket state = SS_PRIV SS_ASYNC

Task = VTYD(18), socketid = 2, Proto = 6,
LA = 10.153.17.99:23, FA = 10.153.17.56:1161,
sndbuf = 8192, rcvbuf = 8192, sb_cc = 0, rb_cc = 0,
socket option = SO_KEEPALIVE SO_OOBINLINE SO_SENDVPNID SO_SETKEEPALIVE,
socket state = SS_ISCONNECTED SS_PRIV SS_ASYNC

Task = VTYD(18), socketid = 3, Proto = 6,
LA = 10.153.17.99:23, FA = 10.153.17.82:1121,
sndbuf = 8192, rcvbuf = 8192, sb_cc = 0, rb_cc = 0,
socket option = SO_KEEPALIVE SO_OOBINLINE SO_SENDVPNID SO_SETKEEPALIVE,
socket state = SS_ISCONNECTED SS_PRIV SS_ASYNC

SOCK_DGRAM:
Task = IKE(63), socketid = 2, Proto = 17,
LA = 0.0.0.0:500, FA = 0.0.0.0:0,
sndbuf = 9216, rcvbuf = 41600, sb_cc = 0, rb_cc = 0,
socket option = SO_REUSEPORT SO_UDPCHECKSUM,
```

```
socket state = SS_PRIV

Task = RDSO(59), socketid = 1, Proto = 17,
LA = 0.0.0.0:1024, FA = 0.0.0.0:0,
sndbuf = 9216, rcvbuf = 41600, sb_cc = 0, rb_cc = 0,
socket option = SO_UDPCHECKSUM,
socket state = SS_PRIV

SOCK_RAW:
Task = ROUT(68), socketid = 2, Proto = 65,
LA = 0.0.0.0, FA = 0.0.0.0,
sndbuf = 32767, rcvbuf = 256000, sb_cc = 0, rb_cc = 0,
socket option = 0,
socket state = SS_PRIV SS_NBIO SS_ASYNC

Task = ROUT(68), socketid = 1, Proto = 2,
LA = 0.0.0.0, FA = 0.0.0.0,
sndbuf = 32767, rcvbuf = 256000, sb_cc = 0, rb_cc = 0,
socket option = SO_SENDVPNID(0),
socket state = SS_PRIV SS_NBIO SS_ASYNC

Task = RSVP(73), socketid = 1, Proto = 46,
LA = 0.0.0.0, FA = 0.0.0.0,
sndbuf = 4194304, rcvbuf = 4194304, sb_cc = 0, rb_cc = 0,
socket option = 0,
socket state = SS_PRIV SS_NBIO SS_ASYNC
```

Table 159 Description on the fields of the display ip socket command

Field	Description
SOCK_STREAM	TCP socket
SOCK_DGRAM	UDP socket
SOCK_RAW	raw IP socket
Task	Task number
socketid	Socket ID
Proto	Protocol number of the socket
LA	Local address and local port number
FA	Remote address and remote port number
sndbuf	sending buffer size of the socket
rcvbuf	receiving buffer size of the socket
sb_cc	Current data size in the sending buffer (It is available only for TCP that can buffer data)
rb_cc	Data size currently in the receiving buffer
socket option	Socket option
socket state	Socket state

display ip statistics

Syntax **display ip statistics**

View Any view

Parameter None

Description Use the **display ip statistics** command to display statistics of IP packets.

Related command: **display ip interface** and **reset ip statistics**.

Example # Display statistics of IP packets.

```
<Sysname> display ip statistics
  Input:    sum            7120             local             112
            bad protocol   0                bad format        0
            bad checksum   0                bad options       0
  Output:   forwarding     0                local             27
            dropped        0                no route          2
            compress fails 0
  Fragment:input           0                output            0
            dropped        0
            fragmented     0                couldn't fragment 0
  Reassembling:sum         0                timeouts          0
```

Table 160 Description on the fields of the display ip statistics command

Field		Description
Input:	sum	Total number of packets received
	local	Total number of packets with destination being local
	bad protocol	Total number of unknown protocol packets
	bad format	Total number of packets with incorrect format
	bad checksum	Total number of packets with incorrect checksum
	bad options	Total number of packets with incorrect option
Output:	forwarding	Total number of packets forwarded
	local	Total number of packets sent from the local
	dropped	Total number of packets discarded
	no route	Total number of packets for which no route is available
	compress fails	Total number of packets failed to compress
Fragment:	input	Total number of fragments received
	output	Total number of fragments sent
	dropped	Total number of fragments dropped
	fragmented	Total number of packets successfully fragmented
	couldn't fragment	Total number of packets that failed to be fragmented
Reassembling	sum	Total number of packets reassembled
	timeouts	Total number of reassembly timeout fragments

display tcp statistics

Syntax **display tcp statistics**

View Any view

Parameter None

Description Use the **display tcp statistics** command to display statistics of TCP traffic.

Related command: **display tcp status** and **reset tcp statistics**.

Example # Display statistics of TCP traffic.

```
<Sysname> display tcp statistics
Received packets:
Total: 753
packets in sequence: 412 (11032 bytes)
window probe packets: 0, window update packets: 0
checksum error: 0, offset error: 0, short error: 0

duplicate packets: 4 (88 bytes), partially duplicate packets: 5 (7 bytes)
out-of-order packets: 0 (0 bytes)
packets of data after window: 0 (0 bytes)
packets received after close: 0

ACK packets: 481 (8776 bytes)
duplicate ACK packets: 7, too much ACK packets: 0

Sent packets:
Total: 665
urgent packets: 0
control packets: 5 (including 1 RST)
window probe packets: 0, window update packets: 2

data packets: 618 (8770 bytes) data packets retransmitted: 0 (0 bytes)
ACK-only packets: 40 (28 delayed)

Retransmitted timeout: 0, connections dropped in retransmitted timeout: 0
Keepalive timeout: 0, keepalive probe: 0, Keepalive timeout, so connections
disconnected : 0
Initiated connections: 0, accepted connections: 0, established connections:0
Closed connections: 0 (dropped: 0, initiated dropped: 0)
Packets dropped with MD5 authentication: 0
Packets permitted with MD5 authentication: 0
```

Table 161 Description on the fields of the display tcp statistics command

Field		Description
Received packets:	Total	Total number of packets received
	packets in sequence	Number of packets arriving in sequence
	window probe packets	Number of window probe packets received
	window update packets	Number of window update packets received
	checksum error	Number of checksum error packets received
	offset error	Number of offset error packets received
	short error	Number of received packets with length being too small
	duplicate packets	Number of completely duplicate packets received
	partially duplicate packets	Number of partially duplicate packets received
	out-of-order packets	Number of out-of-order packets received
	packets of data after window	Number of packets outside the receiving window
	packets received after close	Number of packets that arrived after connection is closed
	ACK packets	Number of ACK packets received
	duplicate ACK packets	Number of duplicate ACK packets received
	too much ACK packets	Number of ACK packets for data unsent
Sent packets:	Total	Total number of packets sent
	urgent packets	Number of urgent packets sent
	control packets	Number of control packets sent
	window probe packets	Number of window probe packets sent; in the brackets are resent packets
	window update packets	Number of window update packets sent
	data packets	Number of data packets sent
	data packets retransmitted	Number of data packets retransmitted
	ACK-only packets	Number of ACK packets sent; in brackets are delayed ACK packets
Retransmitted timeout		Number of retransmission timer timeouts
connections dropped in retransmitted timeout		Number of connections broken due to retransmission timeouts
Keepalive timeout		Number of keepalive timer timeouts
keepalive probe		Number of keepalive probe packets sent
Keepalive timeout, so connections disconnected		Number of connections broken due to timeout of the keepalive timer
Initiated connections		Number of connections initiated
accepted connections		Number of connections accepted
established connections		Number of connections established
Closed connections		Number of connections closed; in brackets are connections closed accidentally (before receiving SYN from the peer) and connections closed initiatively (after receiving SYN from the peer)

Table 161 Description on the fields of the display tcp statistics command

Field	Description
Packets dropped with MD5 authentication	Number of packets dropped with MD5 authentication
Packets permitted with MD5 authentication	Number of packets permitted with MD5 authentication

display tcp status

Syntax **display tcp status**

View Any view

Parameter None

Description Use the **display tcp status** command to display status of all TCP connection for monitoring TCP connections.

Example # Display status of all TCP connections

```
<Sysname> display tcp status
*: TCP MD5 Connection
TCPCB         Local Add:port       Foreign Add:port     State
03e37dc4      0.0.0.0:4001         0.0.0.0:0            Listening
04217174      100.0.0.204:23       100.0.0.253:65508    Established
```

Table 162 Description on the fields of the display tcp status command

Field	Description
*	If the status information of a TCP connection contains *, the TCP adopts the MD5 algorithm for authentication.
TCPCB	TCP control block
Local Add:port	Local IP address and port number
Foreign Add:port	Remote IP address and port number
State	State of the TCP connection

display udp statistics

Syntax **display udp statistics**

View Any view

Parameter None

Description Use the display udp statistics command to display statistics of UDP packets.

Related command: **reset udp statistics**.

Example # Display statistics of UDP packets.

```
<Sysname> display udp statistics
Received packets:
     Total: 0
     checksum error: 0
     shorter than header: 0, data length larger than packet: 0
     unicast(no socket on port): 0
     broadcast/multicast(no socket on port): 0
     not delivered, input socket full: 0
     input packets missing pcb cache: 0
Sent packets:
     Total: 0
```

Table 163 Description on the fields of the display udp statistics command

Field		Description
Received packets:	Total	Total number of UDP packets received
	checksum error	Total number of packets with incorrect checksum
	shorter than header	Number of packets with data shorter than head
	data length larger than packet	Number of packets with data longer than packet
	unicast(no socket on port)	Number of unicast packets with no socket on port
	broadcast/multicast(no socket on port)	Number of broadcast/multicast packets without socket on port
	not delivered, input socket full	Number of packets not delivered to upper layer due to socket buffer being full
	input packets missing pcb cache	Number of packets without matching PCB cache
Sent packets:	Total	Total number of UDP packets sent

ip forward-broadcast

Syntax **ip forward-broadcast** [**acl** *acl-number*]

undo ip forward-broadcast

View Interface view

Parameter **acl** *acl-number*: Number of an ACL from 2000 to 3999. From 2000 to 2999 are numbers for basic ACLs, and from 3000 to 3999 are numbers for advanced ACLs. Only directed broadcasts permitted by the ACL can be forwarded.

Description Use the **ip forward-broadcast** command to enable the interface to forward directed broadcasts.

Use the **undo ip forward-broadcast** command to disable an interface from forwarding directed broadcasts.

By default, an interface is disabled from forwarding directed broadcasts.

Example # Allow Ethernet 1/0 to forward directed broadcasts permitted by ACL 2001.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip forward-broadcast acl 2001
```

ip redirects enable

Syntax **ip redirects enable**

undo ip redirects

View System view

Parameter None

Description Use the **ip redirects enable** command to enable sending ICMP redirect packets.

Use the **undo ip redirects** command to disable sending ICMP redirect packets.

This feature is enabled by default.

Example # Disable sending ICMP redirection packets.

```
<Sysname> system-view
[Sysname] undo ip redirects
```

ip ttl-expires enable

Syntax **ip ttl-expires enable**

undo ip ttl-expires

View System view

Parameter None

Description Use the **ip ttl-expires enable** command to enable the sending of ICMP timeout packets.

Use the **undo ip ttl-expires** command to disable sending ICMP timeout packets.

Sending ICMP timeout packets is enabled by default.

If the feature is disabled, the device will not send TTL timeout ICMP packets, but still send "reassembly timeout" ICMP packets.

Example # Disable sending ICMP timeout packets.

```
<Sysname> system-view
[Sysname] undo ip ttl-expires
```

ip unreachables enable

Syntax **ip unreachables enable**

undo ip unreachables

View System view

Parameter None

Description Use the **ip unreachables enable** command to enable the sending of ICMP destination unreachable packets.

Use the **undo ip unreachables** command to disable sending ICMP destination unreachable packets.

Sending ICMP destination unreachable packets is enabled by default.

If the feature is disabled, the device will not send network unreachable and source route failure ICMP packets, but still send other destination unreachable ICMP packets.

Example # Disable sending ICMP destination unreachable packets.

```
<Sysname> system-view
[Sysname] undo ip unreachables
```

reset ip statistics

Syntax **reset ip statistics**

View User view

Parameter None

Description Use the **reset ip statistics** command to clear statistics of IP packets.

Related command: **display ip interface** and **display ip statistics**.

Example # Clear statistics of IP packets.

```
<Sysname> reset ip statistics
```

reset tcp statistics

Syntax **reset tcp statistics**

View User view

Parameter None

Description Use the **reset tcp statistics** command to clear statistics of TCP traffic.

Related command: **display tcp statistics**.

Example # Display statistics of TCP traffic.

```
<Sysname> reset tcp statistics
```

reset udp statistics

Syntax **reset udp statistics**

View User view

Parameter None

Description Use the **reset udp statistics** command to clear statistics of UDP traffic.

Example # Display statistics of UDP traffic.

```
<Sysname> reset udp statistics
```

tcp anti-naptha enable

Syntax **tcp anti-naptha enable**

undo tcp anti-naptha enable

View System view

Parameter None

Description Use the **tcp anti-naptha enable** command to enable the protection against Naptha attack.

Use the **undo tcp anti-naptha enable** command to disable the protection against Naptha attack.

By default, the protection against Naptha attack is disabled.

Note that the configurations of the **tcp state** and **tcp timer check-state** command will be deleted after the protection against Naptha attack is disabled.

The support for this command varies with devices.

Example # Enable the protection against Naptha attack.

```
<Sysname> system-view
[Sysname] tcp anti-naptha enable
```

tcp mss

Syntax **tcp mss** *value*

undo tcp mss

View Interface view

Parameter *value*: Maximum size of a packet in bytes, ranging from 128 to 2,048.

Description Use the **tcp mss** command to configure the maximum size of TCP packets.

Use the **undo tcp mss** command to restore the default.

By default, the maximum size of a TCP packet is 1460 bytes.

As the default MTU on an interface is 1500 bytes, and there are link layer cost and IP packet head, so the recommended maximum size of TCP packets is about 1200 bytes.

Example # Set the maximum size of TCP packets to 300 bytes on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] tcp mss 300
```

tcp state

Syntax **tcp state** { **closing** | **established** | **fin-wait-1** | **fin-wait-2** | **last-ack** | **syn-received** } **connection-number** *number*

undo tcp state { **closing** | **established** | **fin-wait-1** | **fin-wait-2** | **last-ack** | **syn-received** } **connection-number**

View System view

Parameter **closing**: CLOSING state of a TCP connection.

established: ESTABLISHED state of a TCP connection.

fin-wait-1: FIN_WAIT_1 state of a TCP connection.

fin-wait-2: FIN_WAIT_2 state of a TCP connection.

last-ack: LAST_ACK state of a TCP connection.

syn-received: SYN_RECEIVED state of a TCP connection.

connected-number *number*: Maximum number of TCP connections in a certain state. The argument *number* is in the range of 0 to 500.

Description Use the **tcp state** command to configure the maximum number of TCP connections in a state. When this number is exceeded, the aging of TCP connections in this state will be accelerated.

Use the **undo tcp state** command to restore the default.

By default, the maximum number of TCP connections in each state is 5.

Note the following points:

- You need to enable the protection against Naptha attack before executing this command. Otherwise, an error will be prompted.
- You can respectively configure the maximum number of TCP connections in each state.
- If the maximum number of TCP connections in a state is 0, the aging of TCP connections in this state will not be accelerated.

Related command: **tcp anti-naptha enable**.

This support for this command varies with devices.

Example # Set the maximum number of TCP connections in the ESTABLISHED state to 100.

```
<Sysname> system-view
[Sysname] tcp anti-naptha enable
[Sysname] tcp state established connection-number 100
```

tcp syn-cookie enable

Syntax **tcp syn-cookie enable**

undo tcp syn-cookie enable

View System view

Parameter None

Description Use the **tcp syn-cookie enable** command to enable the SYN Cookie feature to protect the device against SYN Flood attacks.

Use the **undo tcp syn-cookie enable** command to disable the SYN Cookie feature.

By default, the SYN Cookie feature is disabled.

The support for this command varies with devices.

Example # Enable the SYN Cookie feature.

```
<Sysname> system-view
[Sysname] tcp syn-cookie enable
```

tcp timer check-state

Syntax **tcp timer check-state** *time-value*

undo tcp timer check-state

View System view

Parameter *time-value*: TCP connection state check interval in seconds, in the range of 1 to 60.

Description Use the **tcp timer check-state** command to configure the TCP connection state check interval.

Use the **undo tcp timer check-state** command to restore the default.

By default, the TCP connection state check interval is 30 seconds.

The device periodically checks the number of TCP connections in each state. If it detects that the number of TCP connections in a state exceeds the maximum number, it will accelerate the aging of TCP connections in such a state.

Note that you need to enable the protection against Naptha attack before executing this command. Otherwise, an error will be prompted.

Related command: **tcp anti-naptha enable**.

The support for this command varies with devices.

Example # Set the TCP connection state check interval to 40 seconds.

```
<Sysname> system-view
[Sysname] tcp anti-naptha enable
[Sysname] tcp timer check-state 40
```

tcp timer fin-timeout

Syntax **tcp timer fin-timeout** *time-value*

undo tcp timer fin-timeout

View System view

Parameter *time-value*: Length of the TCP finwait timer in seconds, ranging from 76 to 3,600.

Description Use the **tcp timer fin-timeout** command to configure the length of the TCP finwait timer.

Use the **undo tcp timer fin-timeout** command to restore the default.

By default, the length of the TCP finwait timer is 675 seconds.

Note that the actual length of the finwait timer is determined by the following formula:

Actual length of the finwait timer = (Configured length of the finwait timer - 75) + configured length of the synwait timer

Related command: **tcp timer syn-timeout** and **tcp window**.

Example # Set the length of the TCP finwait timer to 800 seconds.

```
<Sysname> system-view
[Sysname] tcp timer fin-timeout 800
```

tcp timer syn-timeout

Syntax **tcp timer syn-timeout** *time-value*

undo tcp timer syn-timeout

View System view

Parameter *time-value*: Length of the TCP finwait timer in seconds, ranging from 2 to 600.

Description Use the **tcp timer syn-timeout** command to configure the length of the TCP synwait timer.

Use the **undo tcp timer syn-timeout** command to restore the default.

By default, the length of the TCP synwait timer is 75 seconds.

Related command: **tcp timer fin-timeout** and **tcp window**.

Example # Set the length of the TCP synwait timer to 80 seconds.

```
<Sysname> system-view
[Sysname] tcp timer syn-timeout 80
```

tcp window

Syntax **tcp window** *window-size*

undo tcp window

View System view

Parameter *window-size*: Receiving/sending buffer size of TCP connection in KB, ranging from 1 to 32.

Description Use the **tcp window** command to configure the receiving/sending buffer size of TCP connection.

Use the **undo tcp window** command to restore the default.

The TCP receiving/sending buffer is 8 KB by default.

Related command: **tcp timer fin-timeout** and **tcp timer syn-timeout**.

Example # Configure the receiving/sending buffer of TCP connection as 3 KB.

```
<Sysname> system-view
[Sysname] tcp window 3
```

61 IP UNICAST POLICY ROUTING CONFIGURATION COMMANDS

apply default output-interface

Syntax **apply default output-interface** *interface-type interface-number* [**track** *track-entry-number*] [*interface-type interface-number* [**track** *track-entry-number*]]

undo apply default output-interface [*interface-type interface-number* [*interface-type interface-number*]]

View policy-based-route view

Parameters *interface-type interface-number*: Specifies an interface.

track *track-entry-number*: Specifies a track entry. The *track-entry-number* is in the range 1 to 1024.

Description Use the **apply default output-interface** command to set the default outgoing interface for matched packets.

Use the **undo apply default output-interface** command to remove the configuration.

Using this command can set two outgoing interfaces at most for load-sharing.

Related commands: **apply ip-precedence**, **apply ip-address next-hop**, **apply output-interface**, and **apply ip-address default next-hop**.

Examples # Set the default outgoing interface for matched packets to Serial2/0.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-policy-based-route] apply default output-interface serial 2
/0 track 1
```

apply ip-address default next-hop

Syntax **apply ip-address default next-hop** *ip-address* [**track** *track-entry-number*] [*ip-address* [**track** *track-entry-number*]]

undo apply ip-address default next-hop [*ip-address* [*ip-address*]]

View policy-based-route view

Parameters *ip-address*: IP address of the default next hop.

track *track-entry-number*: Specifies a track entry. The *track-entry-number* is in the range 1 to 1024.

Description Use the **apply ip-address default next-hop** command to set the default next hop for matched packets.

Use the **undo apply ip-address default next-hop** command to remove the configuration.

At most two default next hops can be specified in one command line.

The next hop interface must be a point-to-point (P2P) interface rather than a broadcast interface.

Related commands: **apply ip-precedence**, **apply output-interface**, **apply default output-interface**, and **apply ip-address next-hop**.

Examples # Set the default next hop to 1.1.1.1 for matched packets.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-policy-based-route] apply ip-address default next-hop 1.1.1
.1 track 1
```

apply ip-address next-hop

Syntax **apply ip-address next-hop** *ip-address* [**track** *track-entry-number*] [*ip-address* [**track** *track-entry-number*]]

undo apply ip-address next-hop [*ip-address* [*ip-address*]]

View policy-based-route view

Parameters *ip-address*: IP address of the next hop.

track *track-entry-number*: Specifies a track entry. The *track-entry-number* is in the range 1 to 1024.

Description Use the **apply ip-address next-hop** command to set a next hop for matched packets.

Use the **undo apply ip-address next-hop** command to remove the configuration.

You can specify up to two next hops in one command line for load-sharing.

Related commands: **apply ip-precedence**, **apply output-interface**, **apply default output-interface**, and **apply ip-address default next-hop**.

Examples # Set the next hop to 1.1.1.1 for matched packets.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-policy-based-route] apply ip-address next-hop 1.1.1.1 track 1
```

apply ip-precedence

Syntax **apply ip-precedence** { *type* | *value* }

undo apply ip-precedence

View policy-based-route view

Parameters *type:* Specifies the precedence type of IP packets.

value: Specifies a precedence value. There are eight precedences (0 to 7) for an IP packet, each corresponding to a keyword. The precedences are listed in the following table:

Table 164 IP precedences and the corresponding keywords

Precedence	Keyword
0	routine
1	priority
2	immediate
3	flash
4	flash-override
5	critical
6	internet
7	network

Description Use the **apply ip-precedence** command to set a precedence for matched packets.

Use the **undo apply ip-precedence** command to remove the setting.

Related commands: **apply output-interface**, **apply ip-address next-hop**, **apply default output-interface**, and **apply ip-address default next-hop**.

Examples # Set the precedence to 5 (critical) for matched packets.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-policy-based-route] apply ip-precedence critical
```

apply output-interface

Syntax **apply output-interface** *interface-type interface-number* [**track** *track-entry-number*] [*interface-type interface-number* [**track** *track-entry-number*]]

undo apply output-interface [*interface-type interface-number* [*interface-type interface-number*]]

View policy-based-route view

Parameters *interface-type interface-number*: Specifies an interface.

track *track-entry-number*: Specifies a track entry. The *track-entry-number* is in the range 1 to 1024.

Description Use the **apply output-interface** command to set the outgoing interface(s) for matched packets.

Use the **undo apply output-interface** command to remove the configuration.

This command is used to specify interfaces (two interfaces at most) to send the matched IP packets.

Note that:

- Two outgoing interfaces at most can be specified for matched IP packets.
- For non-P2P interfaces (broadcast and NBMA interfaces) such as Ethernet interface, multiple next hops are available, and thus packets may not be forwarded successfully.

Non-broadcast multi-access (NBMA) network adopts the unicast mode to send packets.

Related commands: **apply ip-precedence**, **apply ip-address next-hop**, **apply default output-interface**, and **apply ip-address default next-hop**.

Examples # Specify Serial2/0 as the outgoing interface for matched IP packets.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-policy-based-route] apply output-interface serial 2/0 track 1
```

display ip policy-based-route

Syntax **display ip policy-based-route**

View Any view

Parameters None

Description Use the **display ip policy-based-route** command to display all system and interface policy routing information.

Examples # Display all system and interface policy routing information.

```
<Sysname> display ip policy-based-route
Policy Name             interface
pr02                        local
pr02                        Virtual-Template0
pr01                        Ethernet 1/0
```

Table 165 Description on fields of the display ip policy-based-route command

Field	Description
local	System policy routing.
pr02	Name of the policy.
Virtual-Template0	Indicates that the policy named pr02 is applied to interface Virtual-template0.
Ethernet1/0	Indicates that the policy named pr01 is applied to interface Ethernet1/0.

display ip policy-based-route setup

Syntax **display ip policy-based-route setup** { *policy-name* | **interface** *interface-type interface-number* | **local** }

View Any view

Parameters *policy-name*: Displays policy routing information about the specified policy. A policy name is a string of 1 to 19 characters.

interface *interface-type interface-number*: Displays the configuration of policy routing enabled on the interface specified by the argument *interface-type interface-number*.

local: Displays the configuration of enabled system policy routing.

Description Use the **display ip policy-based-route setup** command to display the configuration of enabled policy routing.

Examples # Display the configuration of policy routing enabled on interface Ethernet1/0.

```
<Sysname> display ip policy-based-route setup interface ethernet 1/0
Interface Ethernet1/0 policy based routing configuration information:
 policy-based-route pr01
  permit node 1
    if-match acl 3101
    apply output-interface Ethernet1/0
```

Table 166 Description on fields of the display ip policy-based-route setup command

Field	Description
Interface Ethernet1/0 policy based routing configuration information	Configuration information of policy routing enabled on interface Ethernet1/0

Table 166 Description on fields of the display ip policy-based-route setup command

Field	Description
policy-based-route pr01	The referenced policy name is pr01.
permit node 1	The match mode is **permit** and the policy consists of only node 1.
if-match acl 3101	Packets satisfying ACL 3101 are matched.
apply output-interface Ethernet1/0	The outgoing interface of matched packets is Ethernet1/0.

display ip policy-based-route statistics

Syntax **display ip policy-based-route statistics** { **interface** *interface-type interface-number* | **local** }

View Any view

Parameters **interface** *interface-type interface-number*: Displays statistics of interface policy routing enabled on the interface specified by the argument *interface-type interface-number*.

local: Displays statistics of enabled system policy routing.

Description Use the **display ip policy-based-route statistics** command to display policy routing statistics.

Examples # Display statistics of interface policy routing enabled on interface Ethernet1/0.

```
<Sysname> display ip policy-based-route statistic interface ethernet1/0
Interface Ethernet1/0 policy based routing statistics information:
 policy-based-route: aaa
   permit node 5
     apply output-interface ethernet 1/0
       Denied: 0,
       Forwarded: 0
 Total denied: 0, forwarded: 0
```

Table 167 Description on fields of display ip policy-based-route statistic command

Field	Description
Interface Ethernet1/0 policy based routing statistics information	Statistics of policy routing enabled on interface Ethernet1/0.
policy-based-route: aaa	The policy name is aaa.
permit node 5	The match mode of node 5 is permit.
apply output-interface ethernet 1/0	The outgoing interface of matched packets is Ethernet1/0.
Denied: 0, Forwarded: 0	Unsuccessfully/successfully forwarded packets that match node 5
Total denied: 0, forwarded: 0	Unsuccessfully/successfully forwarded packets that match all nodes of policy aaa

display policy-based-route

Syntax **display policy-based-route** [*policy-name*]

View Any view

Parameters *policy-name*: Policy name, a string of 1 to 19 characters.

Description Use the **display policy-based-route** command to display the configured policy routing information.

Examples # Display the configured policy routing information.

```
<Sysname> display policy-based-route
policy-based-route : aaa
  Node  1  permit :
    apply output-interface Vlan-interface2
```

Table 168 Description on the fields of the display policy-based-route command

Field	Description
policy-based-route : aaa	The policy name is **aaa**.
Node 1 permit :	The match mode of node 1 is permit.
apply output-interface Vlan-interface2	The outgoing interface of matched packets is Ethernet1/0.

if-match acl

Syntax **if-match acl** *acl-number*

undo if-match acl

View policy-based-route view

Parameters *acl-number*: ACL number, in the range of 2000 to 3999. The number of a basic ACL ranges from 2000 to 2999 and that of an advanced ACL ranges from 3000 to 3999.

Description Use the **if-match acl** command to define an ACL match rule.

Use the **undo if-match acl** command to remove the ACL match rule.

Related commands: **if-match packet-length**.

Examples # Permit the packets satisfying ACL 2010.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-policy-based-route] if-match acl 2010
```

if-match packet-length

Syntax **if-match packet-length** *min-len max-len*

undo if-match packet-length

View policy-based-route view

Parameters *min-len*: Minimum IP packet length in bytes, in the range of 0 to 65535.

max-len: Maximum IP packet length in bytes, in the range of 1 to 65535. *max-len* must be no less than *min-len*.

Description Use the **if-match packet-length** command to define a packet length match rule.

Use the **undo if-match packet-length** command to remove the match rule.

Related commands: **if-match acl**.

Examples # Permit the packets with a length from 100 to 200 bytes.

```
<Sysname> system-view
[Sysname] policy-based-route aa permit node 11
[Sysname-policy-based-route] if-match packet-length 100 200
```

ip local policy-based-route

Syntax **ip local policy-based-route** *policy-name*

undo ip local policy-based-route *policy-name*

View System view

Parameters *policy-name*: Policy name, which uniquely identifies a policy-based-route. It is a string of 1 to 19 characters.

Description Use the **ip local policy-based-route** command to enable system policy routing and reference a policy.

Use the **undo ip local policy-based-route** command to disable system policy routing.

System policy routing is disabled by default.

Note that:

- You can only reference one policy when enabling system policy routing.

- System policy routing is used to route packets generated locally. Unless otherwise required, you are not recommended to enable system policy routing.

Related commands: **policy-based-route**.

Examples # Enable system policy routing and reference policy aaa.

```
<Sysname> system-view
[Sysname] ip local policy-based-route aaa
```

ip policy-based-route

Syntax **ip policy-based-route** *policy-name*

undo ip policy-based-route *policy-name*

View Interface view

Parameters *policy-name*: Policy name, a string of 1 to 19 characters.

Description Use the **ip policy-based-route** command to enable policy routing and reference a policy on the interface.

Use the **undo ip policy-based-route** command to disable interface policy routing.

Interface policy routing is disabled by default.

Note that:

- You can only reference one policy when enabling policy routing on an interface.
- The referenced policy filters incoming packets on the interface.

Related commands: **ip local policy-based-route**.

Examples # Enable policy routing and reference policy aaa on interface Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip policy-based-route aaa
```

policy-based-route

Syntax **policy-based-route** *policy-name* [**deny** | **permit**] **node** *node-number*

undo policy-based-route *policy-name* [**deny** | **node** *node-number* | **permit**]

View System view

Parameters *policy-name*: Policy name, a string of 1 to 19 characters.

deny: Specifies the match mode of the policy node as **deny**. When a packet satisfies all rules defined by the **if-match** clauses, the packet will be refused by the node and will not go to match the next policy node.

permit: Specifies the match mode of the policy node as **permit**. If a packet satisfies all the rules defined by the **if-match** clauses, the **apply** clauses are executed. If not, the packet will go to match the next policy node.

node *node-number*: Number of a policy node, in the range of 0 to 65535. The node with a smaller *node-number* is matched first.

Description Use the **policy-based-route** command to define a policy or policy node and enter policy view.

Use the **undo policy-based-route** command to remove a policy or policy node.

No policy or policy node is defined by default.

The default match mode of a policy node is **permit**.

A policy consists of several nodes, and a node consists of **if-match** clauses and **apply** clauses. The **if-match** clauses define the match rules for the node and the **apply** clauses define the actions that should be taken for matched packets. There is an AND relationship between the **if-match** clauses of a node. That is to say, a packet must satisfy all matching rules specified by all **if match** clauses for the node before the action specified by the **apply** clause is taken.

There is an OR relationship between nodes of the policy. That is, if a packet matches a node, it satisfies the policy.

Related commands: **if-match acl** and **if-match packet-length**.

Examples # Configure a policy named policy1, set the match mode of node 10 to **permit**, and enter policy routing view.

```
<Sysname> system-view
[Sysname] policy-based-route policy1 permit node 10
[Sysname-policy-based-route]
```

reset policy-based-route statistics

Syntax **reset policy-based-route statistics** [*policy-name*]

View User view

Parameters *policy-name*: Policy name, a string of 1 to 19 characters.

Description Use the **reset policy-based-route statistics** command to clear the statistics of policy routing based on a specified policy.

If no policy name is specified, this command clears all the policy routing statistics.

Examples # Clear all the policy routing statistics.

```
<Sysname> reset policy-based-route statistics
```

62 UDP HELPER CONFIGURATION COMMANDS

display udp-helper server

Syntax **display udp-helper server** [**interface** *interface-type interface-number*]

View Any view

Parameter **interface** *interface-type interface-number*: Displays information of forwarded UDP packets on the specified interface.

Description Use the **display udp-helper server** command to display the information of forwarded UDP packets on the specified interface or all interfaces.

If *interface-type interface-number* is not specified, this command displays the information of forwarded UDP packets on all interfaces.

Example # Display the information of forwarded UDP packets on the interface Ethernet1/0.

```
<Sysname> display udp-helper server interface ethernet 1/0
Interface name      Server address      Packets sent
Ethernet1/0         192.1.1.2           0
```

The information above shows that the IP address of the destination server corresponding to the interface Ethernet 1/0 is 192.1.1.2, and that no packets are forwarded to the destination server.

reset udp-helper packet

Syntax **reset udp-helper packet**

View User view

Parameter None

Description Use the **reset udp-helper packet** command to clear the statistics of UDP packets forwarded.

Related command: **display udp-helper server**.

Example # Clear the statistics of the forwarded UDP packets.

```
<Sysname> reset udp-helper packet
```

udp-helper enable

Syntax **udp-helper enable**

undo udp-helper enable

View System view

Parameter None

Description Use the **udp-helper enable** command to enable UDP Helper.

Use the **undo udp-helper enable** command to disable UDP Helper.

By default, UDP Helper is disabled.

Example # Enable UDP Helper

```
<Sysname> system-view
[Sysname] udp-helper enable
```

udp-helper port

Syntax **udp-helper port** { *port-number* | **dns** | **netbios-ds** | **netbios-ns** | **tacacs** | **tftp** | **time** }

undo udp-helper port { *port-number* | **dns** | **netbios-ds** | **netbios-ns** | **tacacs** | **tftp** | **time** }

View System view

Parameter *port-number*: UDP port number with which packets need to be forwarded, in the range of 1 to 65535 (except 67 and 68).

dns: Forwards DNS data packets. The corresponding UDP port number is 53.

netbios-ds: Forwards NetBIOS data packets. The corresponding UDP port number is 138.

netbios-ns: Forwards NetBIOS name service data packets. The corresponding UDP port number is 137.

tacacs: Forwards terminal access controller access control system (TACACS) data packets. The corresponding UDP port number is 49.

tftp: Forwards TFTP data packets. The corresponding UDP port number is 69.

time: Forwards time service data packets. The corresponding UDP port number is 37.

Description Use the **udp-helper port** command to enable the forwarding of packets with the specified UDP port number.

Use the **undo udp-helper port** command to remove the configured UDP port numbers.

By default, the UDP Helper enabled device forwards broadcast packets with any of the six destination port numbers 69, 53, 37, 137, 138 and 49. The configured UDP port numbers (including the default UDP port numbers) will all be removed if UDP Helper is disabled.

Example # Forward broadcast packets with the UDP destination port number 100.

```
<Sysname> system-view
[Sysname] udp-helper port 100
```

udp-helper server

Syntax **udp-helper server** *ip-address*

undo udp-helper server [*ip-address*]

View Interface view

Parameter *ip-address*: IP address of the destination server, in dotted decimal notation.

Description Use the **udp-helper server** command to specify the destination server which UDP packets to be forwarded to.

Use the **undo udp-helper server** command to remove the destination server.

No destination server is configured by default.

Currently, you can configure up to 20 destination servers on an interface.

Note that you will remove all the destination servers under the interface if you carry out the **undo udp-helper server** command without the *ip-address* argument.

Related command: **display udp-helper server**.

Example # Specify the IP address of the destination server as 192.1.1.2 on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] udp-helper server 192.1.1.2
```

63 URPF CONFIGURATION COMMANDS

ip urpf

Syntax **ip urpf** { **loose** | **strict** } [**allow-default-route**] [**acl** *acl-number*]

undo ip urpf

View Interface view

Parameter **loose**: Specifies the loose URPF check.

strict: Specifies the strict URPF check.

allow-default-route: Allows special treatment to default route.

acl-number: ACL number, in the range of 2000 to 3999.

- For a basic ACL, the value ranges from 2000 to 2999.
- For an advanced ACL, the value ranges from 3000 to 3999.

Description Use the **ip urpf** command to enable URPF check on the interface.

Use the **undo ip urpf** command to disable this function.

By default, URPF check is disabled.

Example # Enable strict URPF check on interface Ethernet 1/0, allowing special treatment to default route, and referencing ACL 2999.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip urpf strict allow-default-route acl 2999
```

Enable loose URPF check on interface Ethernet 1/1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] ip urpf loose
```

64 FAST FORWARDING COMMANDS

display ip fast-forwarding cache

Syntax **display ip fast-forwarding cache**

View Any view

Parameter None

Description Use the **display ip fast-forwarding cache** command to display the information in the fast forwarding cache.

Example # Display the information in the fast forwarding cache.

```
<Sysname> display ip fast-forwarding cache
Fast-Forwarding cache:  total 3 items
Index  SIP            SPort    DIP       DPort Pro Input_If   Output_If   Flg
412 :0 7.0.0.13       68    8.0.0.1      67    17  Eth1/0   Eth1/1       7
484 :0 8.0.0.1        67    7.0.0.13     68    17  Eth1/1   Eth1/0       7
819 :0 8.0.0.1        8     7.0.0.13     0     1   Eth1/2   Eth1/0       7
```

Table 169 Description on the fields of the display ip fast-forwarding cache command

Field	Description
Index	Unique entry index
SIP	Source IP address
SPort	Source port number
DIP	Destination IP address
DPort	Destination port number
Pro	Protocol number
Input_If	Input interface number
Output_If	Output interface number
Flg	Internal tag, mainly for marking internal operation information such as fragmentation

ip fast-forwarding

Syntax **ip fast-forwarding** [**inbound** | **outbound**]

undo ip fast-forwarding [**inbound** | **outbound**]

View Interface view

Parameter **inbound**: Enables or disables fast forwarding only in the inbound direction.

outbound: Enables or disables fast forwarding only in the outbound direction.

If no parameter is specified, fast forwarding is enabled or disabled in both the inbound and outbound directions.

Description Use the **ip fast-forwarding** command to enable fast forwarding in the inbound and/or outbound direction(s).

Use the **undo ip fast-forwarding** command to disable fast forwarding in the inbound and/or outbound direction(s).

By default, fast forwarding is enabled in both the inbound and outbound directions.

Fast forwarding applies to high speed link interfaces (such as Ethernet and Frame Relay interfaces) rather than low speed link interfaces.

Fast forwarding is supported on high-speed link interfaces (including Ethernet, synchronous PPP, Frame Relay and HDLC interfaces) with firewall, NAT, or GRE configured. Fast forwarding is also supported on PPP MP links and IPHC compression or VJ compression enabled PPP links.

CAUTION:

- *In the case of load balancing using fast forwarding, fast forwarding must be disabled in the corresponding direction of the interface.*
- *The interface on which fast forwarding is enabled stops sending ICMP Redirect messages.*
- *After fast forwarding is enabled on an interface, no IP packet debugging information will be displayed for the interface, that is, the **debugging ip packet** command does not work.*
- *To implement fast forwarding of data flow, you need to enable fast forwarding in the inbound direction of the receive interface and in the outbound direction of the send interface.*
- *When a routing interface is different from its physical interface on links such as MP link or PPPoE links, whether fast forwarding is enabled or not on the physical interface does not affect fast forwarding on the routing interface.*

Example # Enable fast forwarding in the inbound direction of the Ethernet 1/0 interface.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ip fast-forwarding inbound
```

Disable fast forwarding in the inbound direction of the Ethernet 1/1 interface.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] undo ip fast-forwarding
```

reset ip fast-forwarding cache

Syntax **reset ip fast-forwarding cache**

View User view

Parameter None

Description Use the **reset ip fast-forwarding cache** command to clear the information in the fast forwarding cache.

Example # Clear the information in the fast forwarding cache.

```
<Sysname> reset ip fast-forwarding cache
```

65 IPv6 Basics Configuration Commands

display dns ipv6 dynamic-host

Syntax **display dns ipv6 dynamic-host**

View Any view

Parameter None

Description Use the **display dns ipv6 dynamic-host** command to display IPv6 dynamic domain name cache information.

Example # Display IPv6 dynamic domain name cache information.

```
<Sysname> display dns ipv6 dynamic-host
No.     Host               IPv6 Address      TTL
1       aaa                 2001::2           6
```

Table 170 Description on fields of the display dns ipv6 dynamic-host command

Field	Description
No	Sequence number
Host	Host name
IPv6 address	IPv6 address of the host
TTL	Time an entry can be cached in seconds

*For a domain name displayed with the **display dns ipv6 dynamic-host** command, no more than 21 characters can be displayed. If the domain name exceeds the maximum length, the first 21 characters will be displayed.*

display dns ipv6 server

Syntax **display dns ipv6 server** [**dynamic**]

View Any view

Parameter **dynamic**: Displays the information of IPv6 DNS servers acquired dynamically through DHCP or other protocols.

Description Use the **display dns ipv6 server** command to display IPv6 DNS server information.

Example # Display IPv6 DNS server information.

```
<Sysname> display dns ipv6 server
 Type:
  D:Dynamic    S:Static

DNS Server  Type  IPv6 Address                                (Interface Name)
     1        S      1::1
     2        S      FE80:1111:2222:3333:4444:5555:6666:7777  Vlan2
```

Table 171 Description on the fields of the display dns ipv6 server command

Field	Description
DNS Server	Sequence number of the DNS server, which is assigned automatically by the system, starting from 1.
Type	Type of DNS server, where "S" represents a statically configured DNS server, and "D" represents a DNS server obtained dynamically through DHCP.
IPv6 Address	IPv6 address of the DNS server
Interface Name	Name of the interface on the DNS server whose IP address is an IPv6 link-local address.

display ipv6 fib

Syntax **display ipv6 fib** [*ipv6-address*]

View Any view

Parameter *ipv6-address*: Destination IPv6 address whose IPv6 forwarding information base (FIB) entries are to be displayed.

Description Use the **display ipv6 fib** command to display IPv6 FIB entries. If no argument is specified, all IPv6 FIB entries will be displayed.

Example # Display all IPv6 FIB entries.

```
<Sysname> display ipv6 fib
FIB Table:
 Total number of Routes : 1

Flag:
  U:Useable   G:Gateway   H:Host   B:Blackhole   D:Dynamic   S:Static

Destination:    ::1                         PrefixLength    : 128
NextHop  :  ::1                          Flag            : HU
Label    : NULL                             Tunnel ID   : 0
TimeStamp     : Date- 12/5/2004, Time- 9:15:18
Interface    :  InLoopBack0
```

Table 172 Description on fields of the display ipv6 fib command

Field	Description
Total number of Routes	Total number of routes in the FIB
Destination	Destination address to which a packet is to be forwarded
PrefixLength	Prefix length of the destination address
NextHop	Next hop of the route to the destination

Table 172 Description on fields of the display ipv6 fib command

Field	Description
Flag	Route flag: ■ U - Usable route ■ G - Gateway route ■ H - Host route ■ B - Blackhole route ■ D - Dynamic route ■ S - Static route
Label	Label
Tunnel ID	ID of a tunnel
TimeStamp	Generation time of a FIB entry
Interface	Outgoing interface that forwards packets

display ipv6 fibcache

Syntax **display ipv6 fibcache**

View Any view

Parameter None

Description Use the **display ipv6 fibcache** command to display the total number of routes in the IPv6 FIB cache.

Example # Display the total number of routes in the IPv6 FIB cache.

```
<Sysname> display ipv6 fibcache
FIB Cache:
 Total number of Routes : 0
```

display ipv6 host

Syntax **display ipv6 host**

View Any view

Parameter None

Description Use the **display ipv6 host** command to display the mappings between host names and IPv6 addresses in the static DNS database.

Example # Display the mappings between host names and IPv6 addresses in the static DNS database.

```
<Sysname> display ipv6 host
Host                 Age          Flags          IPv6Address
aaa                  0            static          2002::1
bbb                  0            static          2002::2
```

Table 173 Description on fields of the display ipv6 host command

Field	Description
Host	Host name
Age	Time for the entry to live. "0" is displayed in the case of static configuration.
Flags	Flag indicating the type of mapping between a host name and an IPv6 address. Static indicates a static mapping.
IPv6Address	IPv6 address of a host

display ipv6 interface

Syntax **display ipv6 interface** [**brief**] [*interface-type* [*interface-number*]]

View Any view

Parameter **brief**: Displays brief IPv6 information of an interface.

interface-type: Interface type.

interface-number: Interface number.

Description Use the **display ipv6 interface** command to display the IPv6 information of an interface.

If *interface-type interface-number* is not specified, the IPv6 information of all interfaces for which IPv6 addresses can be configured is displayed; if only *interface-type* is specified, the IPv6 information of the interfaces of the specified type for which IPv6 addresses can be configured is displayed; if the *interface-type interface-number* is specified, the IPv6 information of the specified interface is displayed.

Note that:

If you have configured the time slots of a CE1/PRI or CT1/PRI interface as an ISDN PRI group using the **pri-set** command, then executing the **display ip interface brief** command only displays the time slot used by the control channel (D channel), instead of the ones used by the user channels (B channels). For details about CE1/PRI and CT1/PRI interfaces, refer to "Fundamental CE1/PRI Interface Configuration Commands" on page 201 and "Fundamental CT1/PRI Interface Configuration Commands" on page 213.

Example # Display the IPv6 information of Ethernet 1/0 for which an IPv6 address can be configured.

```
<Sysname> display ipv6 interface ethernet 1/0
Ethernet1/0 current state :UP ,
Line protocol current state :UP
```

```
IPv6 is enabled, link-local address is FE80::200:1FF:FE04:5D00
  Global unicast address(es):
    2001::1, subnet is 2001::/64
10::200:1FF:FE04:5D00, subnet is 10::/64 [AUTOCFG]
      [valid lifetime 4641s/preferred lifetime 4637s]
  Joined group address(es):
    FF02::1:FF00:1
    FF02::1:FF04:5D00
    FF02::2
    FF02::1
  MTU is 1500 bytes
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
ND retransmit interval is 1000 milliseconds
  Hosts use stateless autoconfig for addresses
```

Table 174 Description on fields of the display ipv6 interface command (on a router)

Field	Description
Ethernet1/0 current state	Physical state of the interface
Line protocol current state	Link layer state of the interface
IPv6 is enabled	IPv6 packet forwarding state of the interface (IPv6 packet forwarding is enabled in the example)
link-local address	Link-local address configured for the interface
Global unicast address(es)	Aggregatable global unicast address(es) configured for the interface(s)
valid lifetime	Valid lifetime of the global unicast address statelessly auto-configured
preferred lifetime	Preferred lifetime of the global unicast address statelessly auto-configured
Joined group address(es)	Address(es) of multicast group(s) that the interface joins
MTU	Maximum transmission unit of the interface
ND DAD is enabled, number of DAD attempts	Number of DAD attempts, with DAD enabled
ND reachable time	Neighbor reachable time
ND retransmit interval	Interval for retransmitting a neighbor solicitation (NS) message
Hosts use stateless autoconfig for addresses	Hosts use stateless autoconfiguration mode to acquire IPv6 addresses

Display brief IPv6 information of all interfaces for which IPv6 addresses can be configured.

```
<Sysname> display ipv6 interface brief
*down: administratively down
(s): spoofing
Interface                  Physical        Protocol        IPv6 Address
Ethernet1/0                up              up              2001::1
Ethernet1/1                up              down            Unassigned
```

Table 175 Description on fields of display ipv6 interface brief (on a router)

Field	Description
*down	The interface is down, that is, the interface is closed by using the **shutdown** command.

Table 175 Description on fields of display ipv6 interface brief (on a router)

Field	Description
(s)	Spoofing attribute of the interface, that is, the link protocol state of the interface is up, but the link does not exist, or the link is established on demand, instead of being permanent.
Interface	Name of the interface
Physical	Physical state of the interface
Protocol	Link protocol state of the interface
IPv6 Address	IPv6 address of the interface. Only the first of configured IPv6 addresses is displayed. (If no address is configured for the interface, "Unassigned" will be displayed.)

display ipv6 neighbors

Syntax **display ipv6 neighbors** { *ipv6-address* | **all** | **dynamic** | **interface** *interface-type interface-number* | **static** | **vlan** *vlan-id* } [| { **begin** | **exclude** | **include** } *string*]

View Any view

Parameter *ipv6-address*: IPv6 address whose neighbor information is to be displayed.

all: Displays information of all neighbors, including neighbors acquired dynamically and configured statically.

dynamic: Displays information of all neighbors acquired dynamically.

static: Displays information of all neighbors configured statically.

interface *interface-type interface-number*: Displays information of the neighbors of a specified interface.

vlan *vlan-id*: Displays information of the neighbors of a specified VLAN whose ID ranges from 1 to 4094.

|: Filters the output information.

begin: Displays the neighbor entries from the first one containing the specified character string.

include: Displays the neighbor entries containing the specified character string.

exclude: Displays the neighbor entries without the specified character string.

string: A case-sensitive string, consisting of 1 to 256 characters.

Description Use the **display ipv6 neighbors** command to display neighbor information.

Example # Display all neighbor information.

```
<Sysname> display ipv6 neighbors all
                Type: S-Static    D-Dynamic
```

```
IPv6 Address                Link-layer       VID  Interface     State  T   Age
FE80::200:5EFF:FE32:B800  0000-5e32-b800   N/A  Eth1/0       REACH  S   -
```

Table 176 Description on fields of the display ipv6 neighbors command

Field	Description
IPv6 Address	IPv6 address of a neighbor
Link-layer	Link layer address (MAC address of a neighbor)
VID	VLAN to which the interface connected with a neighbor belongs
Interface	Interface connected with a neighbor
State	State of a neighbor, including: ■ INCMP: The address is being resolved. The link layer address of the neighbor is unknown. ■ REACH: The neighbor is reachable. ■ STALE: The reachability of the neighbor is unknown. The device will not verify the reachability any longer unless data is sent to the neighbor. ■ DELAY: The reachability of the neighbor is unknown. The device sends an NS message after a delay. ■ PROBE: The reachability of the neighbor is unknown. The device sends an NS message to verify the reachability of the neighbor.
T	Type of neighbor information, including static configuration and dynamic acquisition.
Age	For a static entry, a hyphen "-" is displayed. For a dynamic entry, the reachable time (in seconds) elapsed is displayed, and if it is never reachable, "#" is displayed (for a neighbor acquired dynamically).

display ipv6 neighbors count

Syntax **display ipv6 neighbors** { **all** | **dynamic** | **interface** *interface-type interface-number* | **static** | **vlan** *vlan-id* } **count**

View Any view

Parameter **all**: Displays the total number of all neighbor entries, including neighbor entries acquired dynamically and configured statically.

dynamic: Displays the total number of all neighbor entries acquired dynamically.

static: Displays the total number of neighbor entries configured statically.

interface *interface-type interface-number*: Displays the total number of neighbor entries of a specified interface.

vlan *vlan-id*: Displays the total number of neighbor entries of a specified VLAN whose ID ranges from 1 to 4094.

Description Use the **display ipv6 neighbors count** command to display the total number of neighbor entries satisfying the specified condition.

Example # Display the total number of neighbor entries acquired dynamically.

```
<Sysname> display ipv6 neighbors dynamic count
Total dynamic entry(ies):  2
```

display ipv6 pathmtu

Syntax **display ipv6 pathmtu** { *ipv6-address* | **all** | **dynamic** | **static** }

View Any view

Parameter *ipv6-address*: IPv6 address whose PMTU information is to be displayed.

all: Displays all PMTU information.

dynamic: Displays all dynamic PMTU information.

dynamic: Displays all static PMTU information.

Description Use the **display ipv6 pathmtu** command to display the PMTU information of IPv6 addresses.

Example # Display all PMTU information.

```
<Sysname> display ipv6 pathmtu all
IPv6 Destination Address    ZoneID  PathMTU     Age     Type
 fe80::12                   0       1300            40      Dynamic
 2222::3                    0       1280            -       Static
```

Table 177 Description on fields of the display ipv6 pathmtu command

Field	Description
IPv6 Destination Address	Destination IPv6 address
ZoneID	ID of address zone, currently invalid
PathMTU	PMTU of an IPv6 address
Age	Time for a PMTU to live. For a static PMTU, a hyphen "-" is displayed.
Type	Indicates the PMTU is dynamically negotiated or statically configured.

display ipv6 socket

Syntax **display ipv6 socket** [**socktype** *socket-type*] [*task-id socket-id*]

View Any view

Parameter **socktype** *socket-type*: Displays the socket information of this type. The socket type is in the range of 1 to 3. The value "1" represents a TCP socket, "2" a UDP socket, and "3" a raw IP socket.

task-id: Displays the socket information of the task. The task ID is in the range 1 to 100.

socket-id: Displays the information of the socket. The socket ID is in the range 0 to 3072.

Description Use the **display ipv6 socket** command to display socket information.

Example # Display the information of all sockets.

```
<Sysname> display ipv6 socket
SOCK_STREAM:
Task = VTYD(14), socketid = 4, Proto = 6,
LA = ::->22, FA = ::->0,
sndbuf = 8192, rcvbuf = 8192, sb_cc = 0, rb_cc = 0,
socket option = SO_ACCEPTCONN SO_REUSEPORT SO_SENDVPNID,
socket state = SS_PRIV SS_ASYNC

Task = VTYD(14), socketid = 3, Proto = 6,
LA = ::->23, FA = ::->0,
sndbuf = 8192, rcvbuf = 8192, sb_cc = 0, rb_cc = 0,
socket option = SO_ACCEPTCONN SO_REUSEPORT SO_SENDVPNID,
socket state = SS_PRIV SS_ASYNC

SOCK_DGRAM:
SOCK_RAW:
```

Table 178 Description on fields of the display ipv6 socket command

Field	Description
SOCK_STREAM	TCP socket
SOCK_DGRAM	UDP socket
SOCK_RAW	Raw IP socket
Task	Task ID of the created socket
socketid	ID assigned by the kernel to the created socket
Proto	Protocol ID
LA	Local address and local port number
FA	Remote address and remote port number
sndbuf	Size of the send buffer
rcvbuf	Size of the receive buffer
sb_cc	Number of bytes sent by the send buffer
rb_cc	Number of bytes received by the receive buffer
socket option	Socket option set by the application
socket state	State of the socket

display ipv6 statistics

Syntax **display ipv6 statistics**

View Any view

Parameter None

Description Use the **display ipv6 statistics** command to display statistics of IPv6 packets and ICMPv6 packets.

Example # Display the statistics of IPv6 packets and ICMPv6 packets.

```
<Sysname> display ipv6 statistics
  IPv6 Protocol:

    Sent packets:
      Total:      0
        Local sent out:     0            forwarded:         0
        raw packets:        0                discarded:         0
        routing failed:     0            fragments:         0
        fragments failed:   0

    Received packets:
      Total:      0
        local host:         0            hopcount exceeded: 0
        format error:       0                option error:          0
        protocol error:     0            fragments:         0
        reassembled:        0                reassembly failed: 0
        reassembly timeout: 0

  ICMPv6 protocol:

    Sent packets:
      Total:      0
        unreached:          0               too big:               0
        hopcount exceeded:  0               reassembly timeout: 0
        parameter problem:  0
        echo request:       0               echo replied:       0
        neighbor solicit:   0               neighbor advert:       0
        router solicit:     0           router advert:      0
        redirected:         0
      Send failed:
        ratelimited:        0               other errors:       0

    Received packets:
      Total:      0
        checksum error:     0          too short:          0
        bad code:           0
        unreached:          0              too big:            0
        hopcount exceeded:  0              reassembly timeout: 0
        parameter problem:  0              unknown error type: 0
        echoed:          0             echo replied:       0
        neighbor solicit:   0              neighbor advert:    0
        router solicit:     0          router advert:      0
        redirected:         0          router renumbering: 0
        unknown info type:  0
      Deliver failed:
        bad length:         0          ratelimited:        0
```

Table 179 Description on fields of the display ipv6 statistics command

Field	Description
IPv6 Protocol:	Statistics of IPv6 packets

Table 179 Description on fields of the display ipv6 statistics command

Field	Description
Sent packets: Total: 0 Local sent out: 0 forwarded: 0 raw packets: 0 discarded: 0 routing failed: 0 fragments: 0 fragments failed: 0	Statistics of sent IPv6 packets, including: ■ Total number of sent packets ■ Number of packets sent locally ■ Number of forwarded packets ■ Number of packets sent via raw socket ■ Number of discarded packets ■ Number of packets failing to be routed ■ Number of sent fragment packets ■ Number of fragments failing to be sent
Received packets: Total: 0 local host: 0 hopcount exceeded: 0 format error: 0 option error: 0 protocol error: 0 fragments: 0 reassembled: 0 reassembly failed: 0 reassembly timeout: 0	Statistics of received IPv6 packets, including ■ Total number of received packets ■ Number of packets received locally ■ Number of packets exceeding the hop limit ■ Number of packets in an incorrect format ■ Number of packets with incorrect options ■ Number of packets with incorrect protocol ■ Number of received fragment packets ■ Number of reassembled packets ■ Number of packets failing to be reassembled ■ Number of packets whose reassembly times out
ICMPv6 protocol: Sent packets: Total: 0 unreached: 0 too big: 0 hopcount exceeded: 0 reassembly timeout: 0 parameter problem: 0 echo request: 0 echo replied: 0 neighbor solicit: 0 neighbor advert: 0 router solicit: 0 router advert 0 redirected: 0 Send failed: ratelimited: 0 other errors: 0	Statistics of ICMPv6 packets Statistics of sent ICMPv6 packets, including ■ Total number of sent packets ■ Number of packets whose destination is unreachable ■ Number of too large packets ■ Number of packets exceeding the hop limit ■ Number of packets whose fragmentation and reassembly times out ■ Number of packets with parameter errors ■ Number of request packets ■ Number of response packets ■ Number of neighbor solicitation packets ■ Number of neighbor advertisement packets ■ Number of router solicit packets ■ Number of router advertisement packets ■ Number of redirected packets ■ Number of packets failing to be sent because of rate limitation ■ Number of packets with other errors

Table 179 Description on fields of the display ipv6 statistics command

Field	Description
Received packets: Total: 0 checksum error: 0 too short: 0 bad code 0 unreached: 0 too big: 0 hopcount exceeded: 0 reassembly timeout: 0 parameter problem: 0 unknown error type: 0 echoed: 0 echo replied: 0 neighbor solicit: 0 neighbor advert: 0 router solicit: 0 router advert 0 redirected: 0 router renumbering 0 unknown info type: 0 Deliver failed: bad length: 0 ratelimited: 0	Statistics of received ICMPv6 packets, including ■ Total number of received packets ■ Number of packets with checksum errors ■ Number of too small packets ■ Number of packets with error codes ■ Number of packets whose destination is unreachable ■ Number of too large packets ■ Number of packets exceeding the hop limit ■ Number of packets whose fragmentation and reassembly times out ■ Number of packets with parameter errors ■ Number of packets with unknown errors ■ Number of request packets ■ Number of response packets ■ Number of neighbor solicitation messages ■ Number of neighbor advertisement packets ■ Number of router solicitation packets ■ Number of router advertisement packets ■ Number of redirected packets ■ Number of packets recounted by the router ■ Number of unknown type of packets ■ Number of packets with a incorrect size ■ Number of packets failing to be received because of rate limitation

display tcp ipv6 statistics

Syntax **display tcp ipv6 statistics**

View Any view

Parameter None

Description Use the **display tcp ipv6 statistics** command to display TCP connection statistics.

Example # Display the statistics of IPv6 TCP connections.

```
<Sysname> display tcp ipv6 statistics
Received packets:
     Total: 0
     packets in sequence: 0 (0 bytes)
     window probe packets: 0, window update packets: 0
     checksum error: 0, offset error: 0, short error: 0

     duplicate packets: 0 (0 bytes), partially duplicate packets: 0 (0 bytes)
```

```
     out-of-order packets: 0 (0 bytes)
     packets with data after window: 0 (0 bytes)
     packets after close: 0

     ACK packets: 0 (0 bytes)
     duplicate ACK packets: 0, too much ACK packets: 0

Sent packets:
     Total: 0
     urgent packets: 0
     control packets: 0 (including 0 RST)
     window probe packets: 0, window update packets: 0

     data packets: 0 (0 bytes) data packets retransmitted: 0 (0 bytes)
     ACK only packets: 0 (0 delayed)

Retransmitted timeout: 0, connections dropped in retransmitted timeout: 0
Keepalive timeout: 0, keepalive probe: 0, keepalive timeout, so connections di
sconnected : 0
Initiated connections: 0, accepted connections: 0, established connections: 0
Closed connections: 0 (dropped: 0, initiated dropped: 0)
```

Table 180 Description on fields of the display tcp ipv6 statistics command

Field	Description
Received packets: Total: 0 packets in sequence: 0 (0 bytes) window probe packets: 0 window update packets: 0 checksum error: 0 offset error: 0 short error: 0 duplicate packets: 0 (0 bytes), partially duplicate packets: 0 (0 bytes) out-of-order packets: 0 (0 bytes) packets with data after window: 0 (0 bytes) packets after close: 0 ACK packets: 0 (0 bytes) duplicate ACK packets: 0 too much ACK packets: 0	Statistics of received packets, including ■ Total number of received packets ■ Number of packets received in sequence ■ Number of window probe packets ■ Number of window size update packets ■ Number of packets with checksum errors ■ Number of packets with offset errors ■ Number of packets whose total length is less than specified by the packet header ■ Number of duplicate packets ■ Number of partially duplicate packets ■ Number of out-of-order packets ■ Number of packets exceeding the size of the receiving window ■ Number of packets received after the connection is closed ■ Number of ACK packets ■ Number of duplicate ACK packets ■ Number of excessive ACK packets

Table 180 Description on fields of the display tcp ipv6 statistics command

Field	Description
Sent packets:	Statistics of sent packets, including
Total: 0	**1** Total number of packets
urgent packets: 0	**2** Number of packets containing an urgent indicator
control packets: 0 (including 0 RST)	**3** Number of control packets
window probe packets: 0	**4** Number of window probe packets
window update packets: 0	**5** Number of window update packets
data packets: 0 (0 bytes) data	**6** Number of data packets
packets retransmitted: 0 (0 bytes)	**7** Number of retransmitted packets
ACK only packets: 0 (0 delayed)	**8** Number of ACK packets
Retransmitted timeout	Number of packets whose retransmission times out
connections dropped in retransmitted timeout	Number of connections dropped because of retransmission timeout
Keepalive timeout	Number of keepalive timeouts
keepalive probe	Number of keepalive probes
Keepalive timeout, so connections disconnected	Number of connections dropped because of keepalive response timeout
Initiated connections	Number of initiated connections
accepted connections	Number of accepted connections
established connections	Number of established connections
Closed connections	Number of closed connections
dropped	Number of dropped connections (after SYN is received from the peer)
initiated dropped	Number of initiated but dropped connections (before SYN is received from the peer)

display tcp ipv6 status

Syntax **display tcp ipv6 status**

View Any view

Parameter None

Description Use the **display tcp ipv6** command to display the TCP connection status.

Example # Display the TCP connection status.

```
<Sysname> display tcp ipv6 status
TCP6CB       Local Address       Foreign Address      State
045d8074     ::->21                ::->0              Listening
```

Table 181 Description on fields of the display tcp ipv6 status command

Field	Description
TCP6CB	IPv6 address of the TCP control block (hexadecimal)
Local Address	Local IPv6 address
Foreign Address	Remote IPv6 address
State	IPv6 TCP connection status, including ■ Closed ■ Listening ■ Syn_Sent ■ Syn_Rcvd ■ Established ■ Close_Wait ■ Fin_Wait1 ■ Closing ■ Last_Ack ■ Fin_Wait2 ■ Time_Wait

display udp ipv6 statistics

Syntax **display udp ipv6 statistics**

View Any view

Parameter None

Description Use the **display udp ipv6 statistics** command to display statistics of UDP packets.

Example # Display statistics information of UDP packets.

```
<Sysname> display udp ipv6 statistics
Received packets:
     Total: 0
     checksum error: 0
     shorter than header: 0, data length larger than packet: 0
     unicast(no socket on port): 0
     broadcast/multicast(no socket on port): 0
     not delivered, input socket full: 0
     input packets missing pcb cache: 0
Sent packets:
     Total: 0
```

Table 182 Description on fields of the display udp ipv6 statistics command

Field	Description
Total	Total number of received/sent packets
checksum error	Total number of packets with a checksum error

Table 182 Description on fields of the display udp ipv6 statistics command

Field	Description
shorter than header	Total number of UDP packets whose total length is less than specified by the packet header
data length larger than packet	Total number of packets whose data length exceeds that specified by the packet header
unicast(no socket on port)	Total number of unicast packets without any socket received on a port
broadcast/multicast(no socket on port)	Total number of broadcast/multicast packets without any socket received on a port
not delivered, input socket full	Number of packets not handled because of the receive buffer being full
input packet missing pcb cache	Number of packets failing to match the PCB cache

dns server ipv6

Syntax **dns server ipv6** *ipv6-address* [*interface-type interface-number*]

undo dns server ipv6 *ipv6-address* [*interface-type interface-number*]

View System view

Parameter *ipv6-address*: IPv6 address of a DNS server.

interface-type interface-number: Specifies an interface. When the IPv6 address of the DNS server is a link-local address, this argument must be specified.

Description Use the **dns server ipv6** command to configure an IPv6 address for a DNS server.

Use the **undo dns server ipv6** command to remove the configured DNS server.

By default, no DNS server is configured.

Example # Configure the IPv6 address 2002::1 for a DNS server.

```
<Sysname> system-view
[Sysname] dns server ipv6 2002::1
```

ipv6

Syntax **ipv6**

undo ipv6

View System view

Parameter None

Description Use the **ipv6** command to enable the IPv6 packet forwarding function.

Use the **undo ipv6** command to disable the IPv6 packet forwarding function.

By default, the IPv6 packet forwarding function is disabled.

Example # Enable the IPv6 packet forwarding function.

```
<Sysname> system-view
[Sysname] ipv6
```

ipv6 address

Syntax **ipv6 address** { *ipv6-address prefix-length* | *ipv6-prefix*/*prefix-length* }

undo ipv6 address [*ipv6-address prefix-length* | *ipv6-prefix*/*prefix-length*]

View Interface view

Parameter *ipv6-address*: IPv6 address.

ipv6-prefix: Prefix of an IPv6 address.

prefix-length: Prefix length of an IPv6 address, in the range 1 to 128.

Description Use the **ipv6 address** command to configure an IPv6 site-local address or aggregatable global unicast address for an interface.

Use the **undo ipv6 address** command to remove the IPv6 address from the interface.

By default, no site-local address or global unicast address is configured for an interface.

Note that except the link-local address automatically configured and the one generated through stateless autoconfiguration, all IPv6 addresses will be removed from the interface if you carry out the **undo ipv6 address** command without any parameter specified.

Example # Set the aggregatable global IPv6 unicast address of Ethernet1/0 to 2001::1/64.

```
<Sysname> system-view
[Sysname] interface Ethernet1/0
[Sysname-Ethernet1/0] ipv6 address 2001::1/64
```

ipv6 address auto link-local

Syntax **ipv6 address auto link-local**

undo ipv6 address auto link-local

View Interface view

Parameter None

Description Use the **ipv6 address auto link-local** command to automatically generate a link-local address for an interface.

Use the **undo ipv6 address auto link-local** command to remove the automatically generated link-local address for an interface.

By default, a link-local address will automatically be generated after a site-local or global IPv6 unicast address is configured for an interface.

Example # Configure Ethernet1/0 to automatically generate a link-local address.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 address auto link-local
```

ipv6 address eui-64

Syntax **ipv6 address** *ipv6-prefix*/*prefix-length* **eui-64**

undo ipv6 address *ipv6-prefix*/*prefix-length* **eui-64**

View Interface view

Parameter *ipv6-prefix*/*prefix-length*: IPv6 address prefix and prefix length. They together specify the prefix of an IPv6 address in the EUI-64 format.

Description Use the **ipv6 address eui-64** command to configure a site-local address or global unicast address in the EUI-64 format for an interface.

Use the **undo ipv6 address eui-64** command to remove the configured site-local address or global unicast address in the EUI-64 format for the interface.

By default, no site-local or global unicast address in EUI-64 format is configured for an interface.

Example # Configure an IPv6 address in the EUI-64 format for Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 address 2001::1/64 eui-64
```

ipv6 address link-local

Syntax **ipv6 address** *ipv6-address* **link-local**

undo ipv6 address *ipv6-address* **link-local**

View Interface view

Parameter *ipv6-address*: IPv6 link-local address. The first ten bits of an address must be 1111111010 (binary), that is, the first group of hexadecimals in the address must be FE80 to FEBF.

Description Use the **ipv6 address link-local** command to configure a link-local address manually for a specified interface.

Use the **undo ipv6 address link-local** command to remove the configured link-local address for the interface.

Example # Configure a link-local address for Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 address fe80::1 link-local
```

ipv6 fibcache

Syntax **ipv6 fibcache**

undo ipv6 fibcache

View System view

Parameter None

Description Use the **ipv6 fibcache** command to enable the caching function of the IPv6 FIB.

Use the **undo ipv6 fibcache** command to disable the caching function of the IPv6 FIB.

By default, the caching function of the IPv6 FIB is disabled.

Note that the caching function of the IPv6 FIB is valid only for packets to be forwarded.

Example # Enable the caching function of the IPv6 FIB.

```
<Sysname> system-view
[Sysname] ipv6 fibcache
```

ipv6 fib-loadbalance-type hash-based

Syntax **ipv6 fib-loadbalance-type hash-based**

undo ipv6 fib-loadbalance-type hash-based

View System view

Parameter None

Description Use the **ipv6 fib-loadbalance-type hash-based** command to specify the load sharing mode based on the HASH algorithm for packet forwarding.

Use the **undo ipv6 fib-loadbalance-type hash-based** command to restore the load sharing mode to the default.

By default, the load sharing based on polling is adopted, that is, each ECMP route is used in turn to forward packets.

Example # Specify the load sharing mode based on the HASH algorithm for packet forwarding.

```
<Sysname> system-view
[Sysname] ipv6 fib-loadbalance-type hash-based
```

ipv6 host

Syntax **ipv6 host** *hostname ipv6-address*

undo ipv6 host *hostname* [*ipv6-address*]

View System view

Parameter *hostname*: Host name, a string of up to 20 characters. The character string can contain letters, numerals, "_", "-", or "." and must contain at least one letter.

ipv6-address: IPv6 address.

Description Use the **ipv6 host** command to configure the mappings between host names and IPv6 addresses.

Use the **undo ipv6 host** command to remove the mappings between host names and IPv6 addresses.

Each host name can correspond to only one IPv6 address.

Example # Configure the mapping between a host name and an IPv6 address.

```
<Sysname> system-view
[Sysname] ipv6 host aaa 2001::1
```

ipv6 icmp-error

Syntax **ipv6 icmp-error** { **bucket** *bucket-size* | **ratelimit** *interval* } *

undo ipv6 icmp-error

View System view

Parameter **bucket** *bucket-size*: Number of tokens in a token bucket, in the range of 1 to 200.

ratelimit *interval*: Update period of the token bucket in milliseconds, in the range of 0 to 2,147,483,647. The update period "0" indicates that the number of ICMPv6 error packets sent is not restricted.

Description Use the **ipv6 icmp-error** command to configure the size and update period of a token bucket.

Use the **undo ipv6 icmp-error** command to restore the defaults.

By default, the size is 10 and the update period is 100 milliseconds. That is, at most 10 ICMPv6 error packets can be sent within these 100 milliseconds.

Example # Set the capacity of the token bucket to 50 and the update period to 100 milliseconds.

```
<Sysname> system-view
[Sysname] ipv6 icmp-error bucket 50 ratelimit 100
```

ipv6 icmpv6 multicast-echo-reply enable

Syntax ipv6 icmpv6 multicast-echo-reply enable

undo ipv6 icmpv6 multicast-echo-reply

View System view

Parameters None

Description Use the **ipv6 icmpv6 multicast-echo-reply enable** command to enable sending of multicast echo replies.

Use the **undo ipv6 icmpv6 multicast-echo-reply** command to disable sending of multicast echo replies.

By default, the device is disabled from sending multicast echo replies.

Examples # Enable sending of multicast echo replies.

```
<Sysname> system-view
[Sysname] ipv6 icmpv6 multicast-echo-reply enable
```

ipv6 mtu

Syntax **ipv6 mtu** *mtu-size*

undo ipv6 mtu

View Interface view

Parameter *mtu-size*: Size of the maximum transmission units (MTUs) of an interface in bytes, in the range of 1,280 to 1,500. The default value is 1,500.

Description Use the **ipv6 mtu** command to set the MTU of IPv6 packets sent over an interface.

Use the **undo ipv6 mtu** command to restore the default MTU.

Set the MTU of IPv6 packets sent over Ethernet1/0 to 1280 bytes.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 mtu 1280
```

ipv6 nd autoconfig managed-address-flag

Syntax **ipv6 nd autoconfig managed-address-flag**

undo ipv6 nd autoconfig managed-address-flag

View Interface view

Parameter None

Description Use the **ipv6 nd autoconfig managed-address-flag** command to set the managed address configuration (M) flag to 1 so that the host can acquire an IPv6 address through stateful autoconfiguration (for example, DHCP server).

Use the **undo ipv6 nd autoconfig managed-address-flag** command to restore the M flag to the default value "0" so that the host can acquire an IPv6 address through stateless autoconfiguration.

By default, the M flag is set to 0.

Example # Configure the host to acquire an IPv6 address through stateful autoconfiguration.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 nd autoconfig managed-address-flag
```

ipv6 nd autoconfig other-flag

Syntax **ipv6 nd autoconfig other-flag**

undo ipv6 nd autoconfig other-flag

View Interface view

Parameter None

Description Use the **ipv6 nd autoconfig other-flag** command to set the other stateful configuration flag (O) flag to 1 so that the host can acquire information other than IPv6 address through stateful autoconfiguration (for example, DHCP server).

Use the **undo ipv6 nd autoconfig other-flag** command to remove the setting so that the host can acquire other information through stateless autoconfiguration.

By default, the O flag is set to 0.

Example # Configure the host to acquire information other than IPv6 address through stateless autoconfiguration.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] undo ipv6 nd autoconfig other-flag
```

ipv6 nd dad attempts

Syntax **ipv6 nd dad attempts** *value*

undo ipv6 nd dad attempts

View Interface view

Parameter *value*: Number of attempts to send an NS message for DAD, in the range of 0 to 600. The default value is "1". When it is set to 0, the DAD is disabled.

Description Use the **ipv6 nd dad attempts** command to configure the number of attempts to send an NS message for DAD.

Use the **undo ipv6 nd dad attempts** command to restore the default.

By default, the number of attempts to send an NS message for DAD is 1.

Example # Set the number of attempts to send an NS message for DAD to 20.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 nd dad attempts 20
```

ipv6 nd hop-limit

Syntax **ipv6 nd hop-limit** *value*

undo ipv6 nd hop-limit

View System view

Parameter *value*: Number of hops, in the range of 0 to 255. When it is set to 0, the Cur Hop Limit field in RA messages sent by the device is 0. That is, the number of hops is determined by the host itself, but not specified by the device.

Description Use the **ipv6 nd hop-limit** command to configure the hop limit advertised by the device.

Use the **undo ipv6 nd hop-limit** command to restore the default hop limit.

By default, the hop limit advertised by the device is 64.

Example # Set the hop limit advertised by the device to 100.

```
<Sysname> system-view
[Sysname] ipv6 nd hop-limit 100
```

ipv6 nd ns retrans-timer

Syntax **ipv6 nd ns retrans-timer** *value*

undo ipv6 nd ns retrans-timer

View Interface view

Parameter *value*: Interval for sending NS messages in milliseconds, in the range of 1,000 to 3,600,000.

Description Use the **ipv6 nd ns retrans-timer** command to set the interval for sending NS messages. The local interface sends NS messages at intervals of this value. Furthermore, the Retrans Timer field in RA messages sent by the local interface is equal to this value.

Use the **undo ipv6 nd ns retrans-timer** command to restore the default interval.

By default, the local interface sends NS messages at intervals of 1,000 milliseconds and the Retrans Timer field in RA messages sent by the local interface is 0.

Example # Specify Ethernet1/0 to send NS messages at intervals of 10,000 milliseconds.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 nd ns retrans-timer 10000
```

ipv6 nd nud reachable-time

Syntax **ipv6 nd nud reachable-time** *value*

undo ipv6 nd nud reachable-time

View Interface view

Parameter *value*: Neighbor reachable time in milliseconds, in the range of 1 to 3,600,000.

Description Use the **ipv6 nd nud reachable-time** command to configure the neighbor reachable time on an interface. This time value serves as not only the neighbor reachable time on the local interface, but also the value of the Reachable Timer field in RA messages sent by the local interface.

Use the **undo ipv6 nd nud reachable-time** command to restore the default neighbor reachable time and to specify the value of the Reachable Timer field in RA messages as 0, so that the number of hops is determined by the host itself, but not specified by the device.

By default, the neighbor reachable time on the local interface is 30,000 milliseconds and the Reachable Timer field in RA messages is 0.

Example # Set the neighbor reachable time on Ethernet1/0 to 10,000 milliseconds.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 nd nud reachable-time 10000
```

ipv6 nd ra halt

Syntax **ipv6 nd ra halt**

undo ipv6 nd ra halt

View Interface view

Parameter None

Description Use the **ipv6 nd ra halt** command to enable RA message suppression.

Use the **undo ipv6 nd ra halt** command to disable the RA message suppression.

By default, RA messages are suppressed.

Example

- On a switch

Suppress RA messages on Vlan-interface100.

```
<Sysname> system-view
[Sysname] interface vlan-interface 100
[Sysname-Vlan-interface100] ipv6 nd ra halt
```

- On a router

Suppress RA messages on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 nd ra halt
```

ipv6 nd ra interval

Syntax **ipv6 nd ra interval** *max-interval-value min-interval-value*

undo ipv6 nd ra interval

View Interface view

Parameter *max-interval-value*: Maximum interval for advertising RA messages in seconds, in the range of 4 to 1,800.

min-interval-value: Minimum interval for advertising RA messages in seconds, in the range of 3 to 1,350.

Description Use the **ipv6 nd ra interval** command to set the maximum and minimum interval for advertising RA messages. The device advertises RA messages at intervals of a random value between the maximum interval and the minimum interval.

Use the **undo ipv6 nd ra interval** command to restore the default.

By default, the maximum interval between RA messages is 600 seconds, and the minimum interval is 200 seconds.

Note the following:

- The minimum interval should be three-fourths of the maximum interval or less.
- The maximum interval for sending RA messages should be less than or equal to the router lifetime in RA messages.

Example # Set the maximum interval for advertising RA messages to 1,000 seconds and the minimum interval to 700 seconds.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 nd ra interval 1000 700
```

ipv6 nd ra prefix

Syntax **ipv6 nd ra prefix** { *ipv6-prefix prefix-length* | *ipv6-prefix*/*prefix-length* } *valid-lifetime preferred-lifetime* [**no-autoconfig** | **off-link**] *

undo ipv6 nd ra prefix *ipv6-prefix*

View Interface view

Parameter *prefix-length*: Prefix length of an IPv6 address.

ipv6-prefix: IPv6 address prefix.

valid-lifetime: Valid lifetime of a prefix in seconds, in the range of 0 to 4,294,967,295.

preferred-lifetime: Preferred lifetime of a prefix used for stateless autoconfiguration in seconds, in the range of 0 to 4,294,967,295.

no-autoconfig: Specifies a prefix not to be used for stateless autoconfiguration. If this keyword is not provided, the prefix is used for stateless autoconfiguration.

off-link: Specifies the address with the prefix not to be directly reachable on the link. If this keyword is not provided, the address with the prefix is directly reachable on the link.

Description Use the **ipv6 nd ra prefix** command to configure the prefix information in RA messages.

Use the **undo ipv6 nd ra prefix** command to remove the prefix information from RA messages.

By default, no prefix information is configured in RA messages and the IPv6 address of the interface sending RA messages is used as the prefix information.

Example # Configure the prefix information for RA messages on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 nd ra prefix 2001:10::100/64 100 10
```

ipv6 nd ra router-lifetime

Syntax **ipv6 nd ra router-lifetime** *value*

undo ipv6 nd ra router-lifetime

View Interface view

Parameter *time*: Router lifetime in seconds, in the range of 0 to 9,000. When it is set to 0, the device does not serve as the default router.

Description Use the **ipv6 nd ra router-lifetime** command to configure the router lifetime in RA messages.

Use the **undo ipv6 nd ra router-lifetime** command to restore the default configuration.

By default, the router lifetime in RA messages is 1,800 seconds.

Note that the router lifetime in RA messages should be greater than or equal to the advertising interval.

Example # Set the router lifetime in RA messages on Ethernet1/0 to 1,000 seconds.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 nd ra router-lifetime 1000
```

ipv6 neighbor

Syntax **ipv6 neighbor** *ipv6-address mac-address* { *vlan-id port-type port-number* | **interface** *interface-type interface-number* }

undo ipv6 neighbor *ipv6-address interface-type interface-number*

View System view

Parameter *ipv6-address*: IPv6 address in a static neighbor entry.

mac-address: Link layer address in a static neighbor entry (48 bits long, in the format of H-H-H).

vlan-id: VLAN ID in a static neighbor entry, in the range of 1 to 4094.

port-type port-number: Type and number of a Layer 2 port in a static neighbor entry.

interface *interface-type interface-number*: Type and number of a Layer 3 interface in a static neighbor entry.

Description Use the **ipv6 neighbor** command to configure a static neighbor entry.

Use the **undo ipv6 neighbor** command to remove a static neighbor entry.

Note that you can adopt the IPv6 address and link layer address of the Layer 3 VLAN interface or those of the VLAN port to configure a static neighbor entry.

- If a static neighbor entry is configured by using the first method, the neighbor entry is in the INCMP state. After the device obtains the corresponding Layer 2 VLAN port information through resolution, the neighbor entry will go into the REACH state.
- If a static neighbor entry is configured by using the second method, the corresponding VLAN interface must exist and the port specified by *port-type port-number* must belong to the VLAN specified by *vlan-id*. After a static neighbor entry is configured, the device will relate the VLAN interface with the IPv6 address to identify a static neighbor entry uniquely and the entry will be in the REACH state.

You only need to specify the corresponding VLAN interface before removing a static neighbor entry.

Example # Configure a static neighbor entry for Layer 3 interface Ethernet1/0.

```
<Sysname> system-view
[Sysname] ipv6 neighbor 2000::1 fe-e0-89 interface ethernet1/0
```

ipv6 neighbors max-learning-num

Syntax **ipv6 neighbors max-learning-num** *number*

undo ipv6 neighbors max-learning-num

View Interface view

Parameter *number*: Maximum number of neighbors that can be dynamically learned by an interface, in the range of 1 to 2,048. The default value is 1,024.

Description Use the **ipv6 neighbors max-learning-num** command to configure the maximum number of neighbors that can be dynamically learned on a specified interface.

Use the **undo ipv6 neighbors max-learning-num** command to restore the default.

Example # Set the maximum number of neighbors that can be dynamically learned on Ethernet1/0 to 10.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 neighbors max-learning-num 10
```

ipv6 pathmtu

Syntax **ipv6 pathmtu** *ipv6-address* [*value*]

undo ipv6 pathmtu *ipv6-address*

View System view

Parameter *ipv6-address*: Specified IPv6 address.

value: PMTU of a specified IPv6 address in bytes, in the range of 1,280 to 10,000.

Description Use the **ipv6 pathmtu** command to configure a static PMTU for a specified IPv6 address.

Use the **undo ipv6 pathmtu** command to remove the PMTU configuration for a specified IPv6 address.

By default, no static PMTU is configured.

Example # Configure a static PMTU for a specified IPv6 address.

```
<Sysname> system-view
[Sysname] ipv6 pathmtu fe80::12 1300
```

ipv6 pathmtu age

Syntax **ipv6 pathmtu age** *age-time*

undo ipv6 pathmtu age

View System view

Parameter *age-time*: Aging time for PMTU in minutes, in the range of 10 to 100.

Description Use the **ipv6 pathmtu age** command to configure the aging time for a dynamic PMTU.

Use the **undo ipv6 pathmtu age** command to restore the default.

By default, the aging time is 10 minutes.

Note that the aging time is invalid for a static PMTU.

Related command: **display ipv6 pathmtu**.

Example # Set the aging time for a dynamic PMTU to 40 minutes.

```
<Sysname> system-view
[Sysname] ipv6 pathmtu age 40
```

reset dns ipv6 dynamic-host

Syntax **reset dns ipv6 dynamic-host**

View User view

Parameter None

Description Use the **reset dns ipv6 dynamic-host** command to clear IPv6 dynamic domain name cache information.

Example # Clear IPv6 dynamic domain name cache information.

```
<Sysname> reset dns ipv6 dynamic-host
```

reset ipv6 fibcache

Syntax **reset ipv6 fibcache**

View User view

Parameter None

Description Use the **reset ipv6 fibcache** command to clear FIB cache entries.

Example # Clear FIB cache entries.

```
<Sysname> reset ipv6 fibcache
```

reset ipv6 neighbors

Syntax **reset ipv6 neighbors** { **all** | **dynamic** | **interface** *interface-type interface-number* | **static** }

View User view

Parameter **all**: Clears the static and dynamic neighbor information on all interfaces.

dynamic: Clears the dynamic neighbor information on all interfaces.

interface *interface-type interface-number*: Clears dynamic neighbor information on a specified interface.

static: Clears the static neighbor information on all interfaces.

Description Use the **reset ipv6 neighbors** command to clear IPv6 neighbor information.

Example # Clear neighbor information on all interfaces.

```
<Sysname> reset ipv6 neighbors all
```

reset ipv6 pathmtu

Syntax **reset ipv6 pathmtu** { **all** | **static** | **dynamic** }

View User view

Parameter **all**: Clears all PMTUs.

static: Clears all static PMTUs.

dynamic: Clears all dynamic PMTUs.

Description Use the **reset ipv6 pathmtu** the command to clear the PMTU information.

Example # Clear all PMTUs.

```
<Sysname> reset ipv6 pathmtu all
```

reset ipv6 statistics

Syntax **reset ipv6 statistics**

View User view

Parameter None

Description Use the **reset ipv6 statistics** command to clear the statistics of IPv6 packets and ICMPv6 packets.

Example # Clear the statistics of IPv6 packets and ICMPv6 packets.

```
<Sysname> reset ipv6 statistics
```

reset tcp ipv6 statistics

Syntax **reset tcp ipv6 statistics**

View User view

Parameter None

Description Use the **reset tcp ipv6 statistics** command to clear the statistics of all TCP connections.

Example # Clear the statistics of all TCP connections.

```
<Sysname> reset tcp ipv6 statistics
```

reset udp ipv6 statistics

Syntax **reset udp ipv6 statistics**

View User view

Parameter None

Description Use the **reset udp ipv6 statistics** command to clear the statistics of all UDP packets.

Example # Clear the statistics of all UDP packets.

```
<Sysname> reset udp ipv6 statistics
```

tcp ipv6 timer fin-timeout

Syntax **tcp ipv6 timer fin-timeout** *wait-time*

undo tcp ipv6 timer fin-timeout

View System view

Parameter *wait-time*: Length of the finwait timer for TCP connections in seconds, in the range of 76 to 3,600.

Description Use the **tcp ipv6 timer fin-timeout** command to set the finwait timer for TCP connections.

Use the **undo tcp ipv6 timer fin-timeout** command to restore the default finwait timer length.

By default, the length of the finwait timer is 675 seconds.

Example # Set the finwait timer length of TCP connections to 800 seconds.

```
<Sysname> system-view
[Sysname] tcp ipv6 timer fin-timeout 800
```

tcp ipv6 timer syn-timeout

Syntax **tcp ipv6 timer syn-timeout** *wait-time*

undo tcp ipv6 timer syn-timeout

View System view

Parameter *wait-time*: Length of the synwait timer for TCP connections in seconds, in the range of 2 to 600.

Description Use the **tcp ipv6 timer syn-timeout** command to set the synwait timer for TCP connections

Use the **undo tcp ipv6 timer syn-timeout** command to restore the default synwait timer length.

By default, the length of the synwait timer of TCP connections is 75 seconds.

Example # Set the synwait timer length of TCP connections to 100 seconds.

```
<Sysname> system-view
[Sysname] tcp ipv6 timer syn-timeout 100
```

tcp ipv6 window

Syntax **tcp ipv6 window** *size*

undo tcp ipv6 window

View System view

Parameter *size*: Size of the TCP sending/receiving buffer in KB (kilobyte), in the range of 1 to 32.

Description Use the **tcp ipv6 window** command to set the size of the TCP sending/receiving buffer.

Use the **undo tcp ipv6 window** command to restore the default.

By default, the size of the TCP sending/receiving buffer is 8 KB.

Example # Set the size of the TCP sending/receiving buffer to 4 KB.

```
<Sysname> system-view
[Sysname] tcp ipv6 window 4
```

66 NAT-PT CONFIGURATION COMMANDS

display natpt address-group

Syntax **display natpt address-group**

View Any view

Parameter None

Description Use the **display natpt address-group** command to display the configuration information of a NAT-PT address pool.

Example # Display the configuration information of a NAT-PT address pool.

```
<Sysname> display natpt address-group
 NATPT IPv4 Address Pool Information:
 1: from 1.1.1.1        to 1.1.1.4
```

Table 183 Description on fields of the display natpt address-group command

Field	Description
1:	Address pool number
from 1.1.1.1	Start address in an address pool
to 1.1.1.4	End address in an address pool

display natpt address-mapping

Syntax **display natpt address-mapping**

View Any view

Parameter None

Description Use the **display natpt address-mapping** command to display the static and dynamic NAT-PT mappings.

The displayed information does not include the information about port translation through the NAPT-PT mechanism.

Example # Display the static and dynamic NAT-PT mapping.

```
<Sysname> display natpt address-mapping
NATPT address mapping(v6bound view):
 IPv4 Address       IPv6 Address                        Type
 1.1.1.1            3001::0001                          SOURCE
 2.2.2.2            3001::0002                          DESTINATION

 NATPT V6Server static mapping:
 IPv4Address              IPv6 Address                    Pro
 1.1.1.1^    6            3001::0003^    1270             TCP
```

Table 184 Description on fields of the display natpt address-mapping command

Field	Description
NATPT address mapping (v6bound view)	Displays the static and dynamic IPv6-to-IPv4 mapping.
Type	Indicates whether the connection is initiated by an IPv6 host or an IPv4 host. If initiated by an IPv6 host, the IPv6 address is the source address. Otherwise, it is the destination address. In the example, 3001::0001 is the source address and 2.2.2.2 is the destination address.
NATPT V6Server static mapping	Displays the NAT-PT address/port mapping.
IPv4Address	IPv4 address and port number
IPv6 Address	IPv6 address and port number
Pro	Protocol type

display natpt aging-time

Syntax **display natpt aging-time**

View Any view

Parameter None

Description Use the **display natpt aging-time** command to display the timeout time for a NAT-PT connection.

Example # Display the timeout time for a NAT-PT session.

```
<Sysname> display natpt aging-time

 NATPT aging-time value information:
      tcp -------aging-time value is     86400 (seconds)
      udp -------aging-time value is     40 (seconds)
     icmp -------aging-time value is     20 (seconds)
      dns -------aging-time value is     10 (seconds)
      syn -------aging-time value is     240 (seconds)
   finrst -------aging-time value is     5 (seconds)
     frag -------aging-time value is     5 (seconds)
```

Table 185 Description on fields of the display natpt aging-time command

Field	Description
tcp -------aging-time value is 86400	The timeout time for a TCP packet is 86400 seconds.
udp -------aging-time value is 40	The timeout time for a UDP packet is 40 seconds.

Table 185 Description on fields of the display natpt aging-time command

Field	Description
icmp -------aging-time value is 20	The timeout time for an ICMP packet is 20 seconds.
dns -------aging-time value is 10	The timeout time for a DNS packet is 10 seconds.
syn -------aging-time value is 240	The timeout time for a synchronization packet is 240 seconds.
finrst -------aging-time value is 5	The timeout time for a finrst packet is 5 seconds.
frag -------aging-time value is 5	The timeout time for a fragmented packet is 5 seconds.

display natpt all

Syntax **display natpt all**

View Any view

Parameter None

Description Use the **display natpt all** command to display all NAT-PT configuration information.

Example # Display all NAT-PT configuration information.

```
<Sysname> display natpt all
NATPT IPv4 Address Pool Information:
 1: from 1.1.1.1        to 1.1.1.4

NATPT address mapping(v6bound view):
 IPv4 Address       IPv6 Address                      Type
 1.1.1.1            3001::0001                        SOURCE
 2.2.2.2            3001::0002                        DESTINATION

 NATPT V6Server static mapping:

         Ethernet1/0
```

For the explanations to the information displayed above, see the descriptions of related commands.

display natpt frag-sessions

Syntax **display natpt frag-sessions**

View Any view

Parameter None

Description Use the **display natpt frag-sessions** command to display the NAT-PT fragment session information.

Example # Display the NAT-PT fragment session information.

```
<Sysname> display natpt frag-sessions
 NATPT Fragment-Session Info:
 No                    IPV6Source              IPV4Source        PacketID
                       IPV6Destination         IPV4Destination
 No Fragment-Sessions Present
```

Table 186 Description on fields of the display natpt frag-sessions command

Field	Description
No	Serial number
IPv6 Source	Source IPv6 address
IPv6 Destination	Destination IPv6 address
IPv4 Source	Source IPv4 address
IPv4 Destination	Destination IPv4 address
PacketID	Serial number of a fragmented packet

display natpt session

Syntax **display natpt session { all | icmp | tcp | udp }**

View Any view

Parameter **all**: Displays the information of all sessions.

icmp: Displays the information of ICMP sessions.

tcp: Displays the information of TCP sessions.

udp: Displays the information of UDP sessions.

Description Use the **display natpt session** command to display the information of dynamic NAT-PT sessions.

Example # Display the information of all dynamic NAT-PT sessions.

```
<Sysname> display natpt session all
 NATPT Session Info:
 No                    IPV6Source              IPV4Source              Pro
                       IPV6Destination         IPV4Destination
 No Sessions Present
```

Table 187 Description on fields of the display natpt session command

Field	Description
No	Serial number
IPV6Source	Source IPv6 address
IPV6Destination	Destination IPv6 address
IPV4 Source	Source IPv4 address
IPV4 Destination	Destination IPv4 address
Pro	Protocol type

display natpt statistics

Syntax **display natpt statistics**

View Any view

Parameter None

Description Use the **display natpt statistics** command to display NAT-PT statistics information.

The statistics information does not include information about port translation through NAPT-PT mechanism.

Example # Display NAT-PT statistics information.

```
<Sysname> display natpt statistics
 NATPT Statistics:
         Total Sessions:    0
         Expired Sessions:  0
         Hits:              0
         Misses:            0
         Total Fragment Sessions:       0
         Expired Fragment Sessions:     0
         Fragment Hits:                 0
         Fragment Misses:               0
         Total Address Mapping:         0 (static: 0  dynamic: 0 )
         Total V6Server Mappings:       0

 NATPT Interfaces:
          Ethernet1/0
```

Table 188 Description on fields of the display natpt statistic command

Field	Description
Total Sessions	Total number of sessions
Expired Session	Number of expired sessions
Hits	Number of successful NAT-PT transactions
Misses	Number of failed NAT-PT transactions
Total Fragment Sessions	Total number of active fragment sessions
Expired Fragment Sessions	Number of expired fragment sessions
Fragment Hits	Number of successful fragment sessions
Fragment Misses	Number of failed fragment sessions
Total Address Mappings	Number of static and dynamic mappings
Total V6Server Mappings	Number of V6Server mappings (address/port mappings)
NATPT Interfaces: Ethernet1/0	NAT-PT enabled interface

natpt address-group

Syntax **natpt address-group** *group-number start-ipv4-address end-ipv4-address*

undo natpt address-group *group-number*

View System view

Parameter *group-number*: Number of an address pool, in the range of 1 to 31.

start-ipv4-address: Start IPv4 address in a pool.

end-ipv4-address: End IPv4 address in a pool.

Description Use the **natpt address-group** command to configure a NAT-PT address pool.

Use the **undo natpt address-group** command to remove a specified NAT-PT address pool.

Note that:

- If *start-ipv4-address* equals *end-ipv4-address*, only one address is available in the address pool.
- The execution of the **undo natpt address-group** command may affect some dynamic NAT-PT mappings.
- Currently, a NAT-PT address pool and an IPv4 NAT address pool do not share any address.
- When there is only one address in the NAT-PT address pool, the address is applied to only NAPT-PT. When there is more than one address in the NAT-PT address pool, the end IPv4 address is reserved for NAPT-PT. The number of addresses applied to dynamic NAT-PT mapping is the number of configured addresses minus 1.

Example # Configure a NAT-PT address pool.

```
<Sysname> system-view
[Sysname] natpt address-group 3 2.3.4.5 2.3.4.10
```

natpt aging-time

Syntax natpt aging-time { default | { dns | finrst | frag | icmp | syn | frag | tcp | udp | } time-value }

View System view

Parameter **default**: Restores the default NAT-PT session timeout time.

dns: Specifies the **DNS** packet timeout time (in seconds), in the range of 5 to 600.

finrst: Specifies the FIN packet timeout time (in seconds), in the range of 5 to 600.

frag: Specifies the FRAG packet timeout time (in seconds), in the range of 5 to 600.

icmp: Specifies the ICMP packet timeout time (in seconds), in the range of 5 to 600.

syn: Specifies the SYN packet timeout time (in seconds), in the range of 5 to 600.

udp: Specifies the UDP packet timeout time (in seconds), in the range of 5 to 600.

tcp: Specifies the TCP packet timeout time (in seconds), in the range of 5 to 86,400.

time-value: NAT-PT session timeout time

Description Use the **natpt aging-time** command to set the NAT-PT session timeout time for different protocol packets.

By default, the timeout time for different protocol packets is as follows:

- 10 seconds for a DNS packet
- 5 seconds for a FINRST packet
- 5 seconds for a FRAG packet
- 20 seconds for an ICMP packet
- 240 seconds for a SYN packet
- 40 seconds for a UDP packet
- 86,400 seconds for a TCP packet

Example # Set the NAT-PT session timeout time to 30 seconds for UDP packets and to 45 seconds for ICMP packets.

```
<Sysname> system-view
[Sysname] natpt aging-time udp 30
[Sysname] natpt aging-time icmp 45
```

natpt enable

Syntax **natpt enable**

undo natpt enable

View Interface view

Parameter None

Description Use the **natpt enable** command to enable the NAT-PT feature on an interface.

Use the **undo natpt enable** command to disable the NAT-PT feature on an interface.

By default, the NAT-PT feature is disabled on an interface. That is, no NAT-PT is implemented for packets received and sent on the interface.

Example # Enable the NAT-PT feature on an interface.

```
<Sysname> system-view
[Sysname] interface Ethernet1/0
[Sysname-Ethernet1/0] natpt enable
```

natpt max-session

Syntax **natpt max-session** *max-number*

undo natpt max-session

View System view

Parameter *max-number*: Maximum number of sessions, in the range of 0 to 2,048.

Description Use the **natpt max-session** command to set the maximum number of NAT-PT sessions.

Use the **undo natpt max-session** command to restore the default maximum number of NAT-PT sessions.

By default, the maximum number of NAT-PT sessions is 2,048.

Example # Configure the system to allow 300 concurrent NAT-PT sessions.

```
<Sysname> system-view
[Sysname] natpt max-session 300
```

natpt prefix

Syntax **natpt prefix** *natpt-prefix* [**interface** *interface-type interface-number* [**nexthop** *ipv4-address*]]

undo natpt prefix *natpt-prefix*

View System view

Parameter *natpt-prefix*: Prefix of an IPv6 address, 96 bits in length.

interface-type interface-number: Interface from which an IPv6 packet is forwarded if the prefix of the destination address of the packet complies with the format of the *natpt-prefix* argument during a dynamic mapping on the IPv6 network side.

ipv4-address: IPv4 address of the specified next hop to which an IPv6 packet is forwarded if the prefix of the destination address of the packet complies with the format *natpt-prefix* for a dynamic IPv6-to-IPv4 mapping.

Description Use the **natpt prefix** command to configure the NAT-PT prefix.

Use the **undo natpt prefix** command to remove the configured NAT-PT prefix.

Note that:

- A NAT-PT prefix must be different from an IPv6 address prefix of an interface on the NAT-PT device. Otherwise, the NAT-PT device will implement a NAT-PT after receiving such a packet from an IPv6 node, resulting in packet loss.
- The execution of the **undo natpt prefix** command may affect the translation of some dynamic mappings. Therefore, be careful with this command.

Example # Configure a NAT-PT prefix.

```
<Sysname> system-view
[Sysname] natpt prefix 2001::
```

natpt turn-off tos

Syntax **natpt turn-off tos**

undo natpt turn-off tos

View System view

Parameter None

Description Use the **natpt turn-off tos** command to set the ToS field in an IPv4 packet translated from IPv6 to 0.

Use the **undo natpt turn-off tos** command to set the ToS field in an IPv4 packet translated from an IPv6 packet to the value of the Traffic Class field in the IPv6 packet.

By default, the value of the ToS field in an IPv4 packet translated from an IPv6 packet is the same as that of the Traffic Class field in the IPv6 packet.

Example # Set the ToS field in an IPv4 packet translated from an IPv6 packet to 0.

```
<Sysname> system-view
[Sysname] natpt turn-off tos
```

natpt turn-off traffic-class

Syntax **natpt turn-off traffic-class**

undo natpt turn-off traffic-class

View System view

Parameter None

Description Use the **natpt turn-off traffic-class** command to set the Traffic Class field in an IPv6 packet translated from an IPv4 packet to 0.

Use the **undo natpt turn-off traffic-class** command to set the Traffic Class field in an IPv6 packet translated from an IPv4 packet to the value of the ToS field in the IPv4 packet.

By default, the value of the Traffic Class field in an IPv6 packet translated from an IPv4 packet is the same as that of the ToS field in the IPv4 packet.

Example # Set the Traffic Class field in an IPv6 packet translated from an IPv4 packet to 0.

```
<Sysname> system-view
[Sysname] natpt turn-off traffic-class
```

natpt v4bound dynamic

Syntax **natpt v4bound dynamic acl number** *acl-number* **prefix** *natpt-prefix*

undo natpt v4bound dynamic acl number *acl-number*

View System view

Parameter *acl-number*: IPv4 access control list (ACL) number, in the range of 2000 to 2999.

natpt-prefix: NAT-PT prefix, 96 bits in length.

Description Use the **natpt v4bound dynamic** command to configure a dynamic IPv4-to-IPv6 mapping.

Use the **undo natpt v4bound dynamic** command to remove the dynamic mapping.

For a packet from an IPv4 host to an IPv6 host, if the source IPv4 address complies with the specified ACL rule, a NAT-PT prefix will be added to translate the source IPv4 address into an IPv6 address.

CAUTION: *The natpt-prefix argument in the* ***natpt v4bound dynamic*** *command must be specified by the* ***natpt prefix*** *command in advance.*

Example # Use ACL 2000 to identify the source address of an IPv4 packet and add the NAT-PT prefix 2001:: to translate the source address into an IPv6 address.

```
<Sysname> system-view
[Sysname] natpt prefix 2001::
[Sysname] natpt v4bound dynamic acl number 2000 prefix 2001::
```

natpt v4bound static

Syntax **natpt v4bound static** { *ipv4-address ipv6-address* | **v6server protocol** *protocol-type ipv4-address-destination ipv4-port-number ipv6-address-destination ipv6-port-number* }

undo natpt v4bound static { *ipv4-address ipv6-address* | **v6server protocol** *protocol-type ipv4-address-destination ipv4-port-number ipv6-address-destination ipv6-port-number* }

View System view

Parameter *ipv4-address:* Source IPv4 address to be mapped.

ipv6-address: IPv6 address to which the source IPv4 address is mapped.

v6server: Specifies to implement the protocol-specific port mapping at the time of address mapping.

protocol-type: Protocol type, including TCP and UDP.

ipv4-address-destination: Destination IPv4 address to be mapped.

ipv4-port-number: IPv4 port number, in the range of 1 to 12287.

ipv6-address-destination: IPv6 address to which the destination IPv4 address is mapped

ipv6-port-number: IPv6 port number, in the range of 1 to 12287.

Description Use the **natpt v4bound static** command to configure the static source IPv4-to-IPv6 address mapping or the static destination IPv4-to-IPv6 address/port mapping.

Use the **undo natpt v4bound static** command to remove the static source IPv4-to-IPv6 address mapping or the static destination IPv4-to-IPv6 address/port mapping.

The *ipv6-address* prefix can be different from the NAT-PT prefix, but it is recommended to be the same as the NAT-PT prefix.

Example # Configure the static mapping from the source IPv4 address 2.3.4.9 to the destination IPv6 address 2001::1.

```
<Sysname> system-view
[Sysname] natpt v4bound static 2.3.4.9 2001::1
```

natpt v6bound dynamic

Syntax **natpt v6bound dynamic** { **acl6 number** *acl6-number* | **prefix** *natpt-prefix* } { **address-group** *address-group* [**no-pat**] | **interface** *interface-type interface-number* }

undo natpt v6bound dynamic { **acl6 number** *acl6-number* | **prefix** *natpt-prefix* }

View System view

Parameter *acl-number*: IPv6 access control list (ACL) number, in the range of 2000 to 2999.

natpt-prefix: NAT-PT prefix, 96 bits in length.

address-group: IPv4 address pool number, in the range of 1 to 31.

interface-type: IPv4 interface type.

interface-number: IPv4 interface number.

no-pat: Specifies no port address translation. If the **no-pat** keyword is not provided, port address translation will be performed.

Description Use the **natpt v6bound dynamic** command to configure a dynamic mapping for packets going from an IPv6 node to an IPv4 node.

Use the **undo natpt v6bound dynamic** command to remove the configured dynamic mapping.

Example # Translate the source address of an IPv6 packet that matches IPv6 ACL 2001 into an IPv4 address in address pool 1.

```
<Sysname> system-view
[Sysname] natpt address-group 1 2.3.4.5 2.3.4.10
[Sysname] natpt v6bound dynamic acl6 number 2001 address-group 1
```

natpt v6bound static

Syntax **natpt v6bound static** *ipv6-address ipv4-address*

undo natpt v6bound static *ipv6-address ipv4-address*

View System view

Parameter *ipv6-address*: Source IPv6 address to be mapped.

ipv4-address: IPv4 address to which an IPv6 address is mapped.

Description Use the **natpt v6bound static** command to configure the static IPv6-to-IPv4 address mapping.

Use the **undo natpt v6bound static** command to remove the static IPv6-to-IPv4 address mapping.

Example # Configure the static mapping between the source IPv6 address 2001::1 and the IPv4 address 2.3.4.5.

```
<Sysname> system-view
[Sysname] natpt v6bound static 2001::1 2.3.4.5
```

reset natpt dynamic-mappings

Syntax **reset natpt dynamic-mappings**

View User view

Parameter None

Description Use the **reset natpt dynamic-mappings** command to clear dynamic NAT-PT address mappings.

Example # Clear dynamic NAT-PT address mappings.

```
<Sysname> reset natpt dynamic-mappings
```

reset natpt statistics

Syntax **reset natpt statistics**

View User view

Parameter None

Description Use the **reset natpt statistics** command to clear all NAT-PT statistics information.

Example # Clear all NAT-PT statistics information.

```
<Sysname> reset natpt statistics
```

67 DUAL STACK CONFIGURATION COMMANDS

ipv6

Syntax **ipv6**

undo ipv6

View System view

Parameter None

Description Use the **ipv6** command to enable the IPv6 packet forwarding function.

Use the **undo ipv6** command to disable the IPv6 packet forwarding function.

By default, the function is disabled.

Example # Enable the IPv6 packet forwarding function.

```
<Sysname> system-view
[Sysname] ipv6
```

ipv6 address

Syntax **ipv6 address** { *ipv6-address prefix-length* | *ipv6-address*/*prefix-length* }

undo ipv6 address [*ipv6-address prefix-length* | *ipv6-address*/*prefix-length*]

View Interface view

Parameter *ipv6-address*: IPv6 address for the interface.

prefix-length: Length of the prefix in bits, in the range of 1 to 128.

Description Use the **ipv6 address** command to configure a site-local address or global unicast address for an interface.

Use the **undo ipv6 address** command to remove the configuration.

By default, neither site-local addresses nor global unicast addresses are configured.

Note that:

- Up to 10 global unicast addresses and site-local addresses can be configured on an interface in total.
- The **undo ipv6 address** command without parameters removes all IPv6 addresses manually configured, except link-local addresses automatically configured on the interface.

Example # Set the global unicast address of interface Ethernet 1/1 to 2001::1/64.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] ipv6 address 2001::1/64
```

ipv6 address auto link-local

Syntax **ipv6 address auto link-local**

undo ipv6 address auto link-local

View Interface view

Parameter None

Description Use the **ipv6 address auto link-local** command to enable the device to automatically create a link-local address for an interface.

Use the **undo ipv6 address auto link-local** command to remove the automatically created link-local address.

By default, a link-local address will automatically be generated when an IPv6 site-local address or IPv6 global unicast address is configured for an interface.

Example # Enable interface Ethernet 1/1 to create a link-local address automatically.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] ipv6 address auto link-local
```

ipv6 address eui-64

Syntax **ipv6 address** *ipv6-address/prefix-length* **eui-64**

undo ipv6 address *ipv6-address/prefix-length* **eui-64**

View Ethernet interface view

Parameter *ipv6-address***/***prefix-length*: IPv6 address and prefix length. They together specify the prefix of an IPv6 address in the EUI-64 format. The prefix length of an EUI-64 address ranges from 1 to 64.

Description Use the **ipv6 address eui-64** command to configure a site-local address or global unicast address in the EUI-64 format on an interface.

Use the **undo ipv6 address eui-64** command to delete the site-local address or global unicast address in the EUI-64 format on an interface.

By default, no site-local or global unicast address in the EUI-64 format is configured for an interface.

Example # Configure Ethernet 1/1 to create an IPv6 address in the EUI-64 format.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] ipv6 address 2001::1/64 eui-64
```

ipv6 address link-local

Syntax **ipv6 address** *ipv6-address* **link-local**

undo ipv6 address *ipv6-address* **link-local**

View Interface view

Parameter *ipv6-address*: IPv6 link-local address. The high-order ten bits of an IPv6 link-local address must be 1111111010 (binary), that is to say, the first group of the IPv6 link-local address must range from FE80 to FEBF (hexadecimal).

Description Use the **ipv6 address link-local** command to configure manually a link-local address for the current interface.

Use the **undo ipv6 address link-local** command to remove the link-local address of the interface.

By default, a link-local address will automatically be generated when an IPv6 site-local address or global unicast address is configured for an interface.

Example # Configure a link-local address on Ethernet 1/1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/1
[Sysname-Ethernet1/1] ipv6 address fe80::1 link-local
```

68 TUNNELING CONFIGURATION COMMANDS

A tunnel interface number is in the X format, where X ranges from 0 to 1023.

destination

Syntax **destination** { *ip-address* | *ipv6-address* }

undo destination

View Tunnel interface view

Parameter *ip-address*: Destination IPv4 address of a specified tunnel interface.

ip-address: Destination IPv6 address of a specified tunnel interface.

Description Use the command **destination** to specify a destination address for the tunnel interface.

Use the **undo destination** command to remove the configured destination IP address.

By default, no destination address is configured for the tunnel interface.

Note that:

- The destination address of a tunnel interface is the address of the peer interface receiving packets and is usually the source address of the peer tunnel interface.
- Two or more tunnel interfaces using the same encapsulation protocol must have different source and destination addresses.

Related command: **interface tunnel** and **source**.

Example # Set Serial2/0 (193.101.1.1) of Sysname 1 and Serial2/0 (192.100.1.1) of Sysname 2 to the source and destination interfaces of a tunnel between two devices, respectively.

```
<Sysname1> system-view
[Sysname1] interface tunnel 0
[Sysname1-Tunnel0] source 193.101.1.1
[Sysname1-Tunnel0] destination 192.100.1.1
<Sysname2> system-view
```

```
[Sysname2] interface tunnel 1
[Sysname2-Tunnel1] source 192.100.1.1
[Sysname2-Tunnel1] destination 193.101.1.1
```

display interface tunnel

Syntax **display interface tunnel** [*number*]

View Any view

Parameter *number*: Tunnel interface number. If the *number* argument is not specified, the information of all tunnel interfaces will be displayed.

Description Use the **display interface tunnel** command to display related information of a specified tunnel interface, such as source address, destination address, and encapsulation mode.

Related command: **interface tunnel**, **source**, **destination**, and **tunnel-protocol**.

Example # Display information of the interface tunnel 0.

```
<Sysname> display interface tunnel 0
Tunnel0 current state: UP
Line protocol current state: UP
Description: Tunnel0 Interface
The Maximum Transmit Unit is 64000
Internet Address is 10.1.2.1/24 Primary
Encapsulation is TUNNEL, aggregation ID not set
Tunnel source 192.13.2.1, destination 192.13.2.2
Tunnel keepalive disable
Tunnel protocol/transport GRE/IP
    GRE key disabled
    Checksumming of GRE packets disabled
    Last 300 seconds input:  0 bytes/sec, 0 packets/sec
    Last 300 seconds output:  0 bytes/sec, 0 packets/sec
    361 packets input,  9953388 bytes
    0 input error
    361 packets output,  30324 bytes
    0 output error
```

Table 189 Description on fields of the display interface tunnel command

Field	Description
Tunnel0 current state: UP	The physical layer of the tunnel interface is reachable.
Line protocol current state: UP	The link layer of the tunnel interface is reachable.
Description	Descriptive information of a tunnel interface
Tunnel0 Interface	Tunnel interface number
Maximum Transmit Unit	Maximum transmission unit (MTU) in a tunnel
Encapsulation is TUNNEL	The encapsulation protocol is tunnel.

Table 189 Description on fields of the display interface tunnel command

Field	Description
aggregation ID	Link aggregation group ID referenced by a tunnel. If the device supports link aggregation groups, the link aggregation group ID configured in tunnel interface view is displayed. If device does not support, "aggregation ID not set" is displayed.
Tunnel source	Source address of a tunnel.
destination	Destination address of a tunnel.
Tunnel keepalive disable	Disables the keepalive function of the GRE so as not to detect the tunnel interface state.
Tunnel protocol/transport	Tunnel protocol and transport protocol.
GRE key disabled	No key is configured for the GRE tunnel interface.
Checksumming of GRE packets disabled	Disables the GRE packet checksum function.
Last 300 seconds input	Number of bytes and packets input per second in the last five minutes.
Last 300 seconds output	Number of bytes and packets output per second in the last five minutes.
packets input	Total number of input packets.
input error	Number of error packets among all input packets.
packets output	Total number of output packets.
output error	Number of error packets in all output packets

display ipv6 interface tunnel

Syntax **display ipv6 interface tunnel** *number*

View Any view

Parameter *number*: Tunnel interface number.

Description Use the **display ipv6 interface tunnel** command to display related IPv6 information of a specified tunnel interface, including link state, IPv6 protocol state, and IPv6 address.

Example # Display information of the interface tunnel 0.

```
<Sysname> display ipv6 interface tunnel 0
Tunnel0 current state :UP
Line protocol current state :UP
IPv6 is enabled, link-local address is FE80::101:101
  Global unicast address(es):
    2002:101:101::1, subnet is 2002::/16
  Joined group address(es):
    FF02::1:FF01:101
    FF02::1:FF00:1
    FF02::2
    FF02::1
  MTU is 1500 bytes
```

```
ND reachable time is 30000 milliseconds
ND retransmit interval is 1000 milliseconds
Hosts use stateless autoconfig for addresses
```

Table 190 Description on fields of the display interface tunnel command

Field	Description
Tunnel0 current state: UP	The physical layer of the tunnel interface is reachable.
Line protocol current state: UP	The link layer of the tunnel interface is reachable.
IPv6 is enabled	Enables IPv6 on a tunnel interface
link-local address	Link-local address of a tunnel interface
Global unicast address(es)	Aggregatable global unicast address of a tunnel interface.
Joined group address(es)	Multicast address of a tunnel interface.
MTU is 1500 bytes	Size of the MTU in a tunnel. The MTU in this example is 1,500 bytes.
ND reachable time	Neighbor reachable time
ND retransmit interval	Interval for retransmitting a neighbor discovery message.
Hosts use stateless autoconfig for addresses	Hosts use the stateless auto-configuration mode to acquire IPv6 addresses.

encapsulation-limit

Syntax **encapsulation-limit** [*number*]

undo encapsulation-limit

View Tunnel interface view

Parameter *number*: Number of nested encapsulations in a tunnel, in the range of 1 to 10. The default value is 4.

Description Use the **encapsulation-limit** command to configure the maximum number of nested encapsulations of a packet.

Use the **undo encapsulation-limit** command to remove the encapsulation limit.

The encapsulation limit is only applicable to the IPv6 over IPv6 tunnel.

Example # Configure the maximum number of nested encapsulations in a tunnel to 3.

```
<Sysname> system-view
[Sysname] interface tunnel 2
[Sysname-Tunnel2] tunnel-protocol ipv6-ipv6
[Sysname-Tunnel2] encapsulation-limit 3
```

interface tunnel

Syntax **interface tunnel** *number*

undo interface tunnel *number*

View System view

Parameter *number*: Tunnel interface number, in the range of 0 to 1023. The number of tunnels that can be created is restricted by the total number of interfaces and the memory.

Description Use the **interface tunnel** command to create a tunnel interface and enter tunnel interface view.

Use the **undo interface tunnel** command to remove a specified tunnel interface.

By default, there is no tunnel interface on the device.

- Carry out the **interface tunnel** command to enter interface view of a specified tunnel. If the tunnel interface is not created, you must create it before entering tunnel interface view.
- A tunnel interface number has only local significance, and therefore, the same interface number or different interface numbers can be set at both ends of a tunnel.

Related command: **display interface tunnel**, **source**, **destination**, and **tunnel-protocol**.

Example # Create the interface tunnel 3.

```
<Sysname> system-view
[Sysname] interface tunnel 3
[Sysname-Tunnel3]
```

mtu

Syntax **mtu** *mtu-size*

undo mtu

View Tunnel interface view

Parameter *mtu-size*: Tunnel interface MTU in bytes, in the range of 100 to 64,000.

Description Use the **mtu** command to configure the tunnel interface MTU.

Use the **undo mtu** command to restore the default tunnel interface MTU.

The default value varies with devices.

Example # Set the tunnel interface MTU to 10,000 bytes.

```
<Sysname> system-view
[Sysname] interface tunnel 3
[Sysname-Tunnel3] mtu 10000
```

source

Syntax **source** { *ip-address* | *ipv6-address* | *interface-type interface-num* }

undo source

View Tunnel interface view

Parameter *ip-address*: Source IPv4 address of a tunnel interface.

ip-address: Source IPv6 address of a tunnel interface.

interface-type interface-number: Specifies an interface. The interface types include Ethernet, serial, ATM, tunnel, and loopback.

Description Use the **source** command to specify a source address for a tunnel interface.

Use the **undo source** command to remove the configured source IP address.

By default, no source address is configured for a tunnel interface.

Note that:

- The source address of a tunnel interface is the address of the interface sending packets and is usually the destination address of the peer tunnel interface.
- Two or more tunnel interfaces using the same encapsulation protocol must have different source addresses and destination addresses.

Related command: **interface tunnel** and **destination**.

Example # Configure the interface tunnel 5. The actual outgoing interface encapsulating packets is Serial2/0 (192.100.1.1).

```
<Sysname> system-view
[Sysname] interface tunnel 5
[Sysname-Tunnel5] source 192.100.1.1
```

Or

```
<Sysname> system-view
[Sysname] interface tunnel 5
[Sysname-Tunnel5] source serial 2/0
```

tunnel-protocol

Syntax **tunnel-protocol** { **ipv4-ipv4** | **ipv6-ipv4** [**6to4** | **auto-tunnel** | **isatap**] | **ipv6-ipv6** | **ipv4-ipv6** }

undo tunnel-protocol

View Tunnel interface view

Parameter **ipv4-ipv4**: Sets the tunnel to an IPv4 over IPv4 tunnel.

Ipv4-ipv6: Sets the tunnel to an IPv4 over IPv6 tunnel.

ipv6-ipv4: Sets the tunnel to an IPv6 over IPv4 tunnel.

ipv6-ipv4 6to4: Sets the tunnel to IPv6 over IPv4 6to4 tunnel.

ipv6-ipv4 auto-tunnel: Sets the tunnel to an automatic IPv4 compatible IPv6 tunnel.

ipv6-ipv4 isatap: Sets the tunnel to an IPv6 over IPv4 ISATAP tunnel.

ipv6-ipv6: Sets the tunnel to an IPv6 over IPv6 tunnel.

mpls te: Sets the tunnel to an MPLS TE tunnel.

Description Use the **tunnel-protocol** command to configure the tunnel type.

Use the **undo tunnel-protocol** to restore the tunnel type to the default.

By default, the tunnel is GRE tunnel.

Note that:

- A proper tunnel type can be selected for packet encapsulation according to the network topology and application. The same tunnel type must be configured at both ends of the tunnel. Otherwise, packet delivery will fail.
- Only one automatic tunnel can be configured at the same tunnel source.

For details about MPLS TE tunnel, refer to "mpls te tunnel-id" on page 1636.

Example # Specify the tunnel type as IPv4 over IPv4 for a tunnel interface.

```
<Sysname> system-view
[Sysname] interface tunnel 2
[Sysname-Tunnel2] tunnel-protocol ipv4-ipv4
```

69 IPv6 Unicast Policy Routing Configuration Commands

apply default output-interface

Syntax **apply default output-interface** *interface-type interface-number*

undo apply default output-interface [*interface-type interface-number*]

View IPv6 policy-based-route view

Parameter *interface-type interface-number*: Specifies an interface.

Description Use the **apply default output-interface** command to set a default outgoing interface for IPv6 packets.

Use the **undo apply default output-interface** command to remove the default outgoing interface.

This command only applies to packets not finding a match in the routing table. You can specify up to five default outgoing interfaces, implementing load balancing based on data streams.

Related command: **apply ipv6-precedence**, **apply ipv6-address next-hop**, **apply output-interface**, **apply ipv6-address default next-hop**.

Example # Set the default outgoing interface to the interface Serial 2/0.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply default output-interface serial 2/0
```

apply destination-based-forwarding

Syntax **apply destination-based-forwarding**

undo apply destination-based-forwarding

View IPv6 policy-based-route view

Parameter None

Description Use the **apply destination-based-forwarding** command to enable destination based forwarding.

Use the **undo apply destination-based-forwarding** command to disable destination based forwarding.

By default, destination based forwarding is disabled.

With destination based forwarding enabled, IPv6 packets not matching the policy node can be routed through the routing table; otherwise, such packets will be discarded.

Example # Enable destination based forwarding.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply destination-based-forwarding
```

apply ipv6-address default next-hop

Syntax **apply ipv6-address default next-hop** *ipv6-address*

undo apply ipv6-address default next-hop [*ipv6-address*]

View IPv6 policy-based-route view

Parameter *ipv6-address*: Default next hop.

Description Use the **apply ipv6-address default next-hop** command to set a default next hop for matched IPv6 packets.

Use the **undo apply ipv6-address default next-hop** command to remove the default next hop.

This command only applies to packets not finding a match in the routing table. You can specify up to five default next hops, implementing load balancing based on data streams. The interface to reach the next hop must be a P2P interface rather than a broadcast interface.

Related command: **apply ipv6-precedence**, **apply output-interface**, **apply default output-interface** and **apply ipv6-address next-hop**.

Example # Set a default next hop of 1::1 for matched IPv6 packets.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply ipv6-address default next-hop 1::1
```

apply ipv6-address next-hop

Syntax **apply ipv6-address next-hop** *ipv6-address*

undo apply ipv6-address next-hop [*ipv6-address*]

View IPv6 policy-based-route view

Parameter *ipv6-address*: IPv6 address of a next hop

Description Use the **apply ipv6-address next-hop** command to set a next hop for matched IPv6 packets.

Use the **undo apply ipv6-address next-hop** command to remove the next hop.

The next hop must be adjacent to the device. You can specify up to five next hops, implementing load balancing based on data streams.

Related command: **apply ipv6-precedence**, **apply output-interface**, **apply default output-interface** and **apply ipv6-address default next-hop**.

Example # Set a next hop of 1::1 for matched IPv6 packets.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply ipv6-address next-hop 1::1
```

apply ipv6-precedence

Syntax **apply ipv6-precedence** { *type* | *value* }

undo apply ipv6-precedence

View IPv6 policy-based-route view

Parameter *type*: Preference type for matched IPv6 packets, types including routine, priority, immediate, flash, flash-override, critical internet and network.

value: Preference value for matched IPv6 packets from 0 to 7 (inclusive). Each value corresponds to a keyword, as shown in the following table.

Table 191 Preferences and the corresponding keywords

Preference value	Keyword
0	routine
1	priority
2	immediate
3	flash

Table 191 Preferences and the corresponding keywords

Preference value	Keyword
4	flash-override
5	critical
6	internet
7	network

Description Use the **apply ipv6-precedence** command to set a preference for matched IPv6 packets.

Use the **undo apply ipv6-precedence** command to remove the preference.

Related command: **apply output-interface**, **apply ipv6-address next-hop**, **apply default output-interface**, **apply ipv6-address default next-hop**.

Example # Set a preference of 5 (critical) for matched IPv6 packets.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply ipv6-precedence critical
```

apply output-interface

Syntax **apply output-interface** *interface-type interface-number*

undo apply output-interface [*interface-type interface-number*]

View IPv6 policy-based-route view

Parameter *interface-type interface-number*: Specifies an interface.

Description Use the **apply output-interface** command to set an outgoing interface for matched IPv6 packets.

Use the **undo apply output-interface** command to remove the outgoing interface.

Note that:

- Five outgoing interfaces at most can be specified, and load balancing based on data streams can be implemented.
- For non-P2P interfaces (broadcast and NBMA interfaces) such as Ethernet interface, multiple next hops are available, and thus packets may not be forwarded successfully.

Related command: **apply ipv6-precedence**, **apply ipv6-address next-hop**, **apply default output-interface**, **apply ipv6-address default next-hop**.

Example # Specify the interface Serial 2/0 as the outgoing interface for matched IPv6 packets.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] apply output-interface serial 2/0
```

display ipv6 config policy-based-route

Syntax **display ipv6 config policy-based-route** *policy-name*

View Any view

Parameter *policy-name*: Policy name, a string of 1 to 19 characters.

Description Use the **display ipv6 config policy-based-route** command to display the configured IPv6 policy routing information.

Example # Display the configured IPv6 policy routing information.

```
<Sysname> display ipv6 config policy-based-route
 IPv6 Policy based routing configuration information:
 ipv6 policy-based-route : abc
  Node  1  permit :
       apply output-interface Ethernet1/0
```

Table 192 Description on the fields of the display ipv6 config policy-based-route command

Field	Description
IPv6 Policy based routing configuration information	IPv6 policy routing configuration information
ipv6 policy-based-route: abc	Policy name
Node 1 permit :	The match mode of Node 1 is permit.
apply output-interface Ethernet1/0	The outgoing interface for matched packet is Ethernet1/0.

display ipv6 policy-based-route

Syntax **display ipv6 policy-based-route**

View Any view

Parameter None

Description Use the **display ipv6 policy-based-route** command to display system and interface IPv6 policy routing information.

Example # Display system and interface IPv6 policy routing information.

```
<Sysname> display ipv6 policy-based-route
Policy Name              interface
pr02                     local
pr02                     Virtual-Template0
pr01                     Ethernet 1/0
```

Table 193 Description on fields of the display ipv6 policy-based-route command

Field	Description
Local	System policy routing
pr02	Policy name
Virtual-Template0	Policy pr02 applied to Virtual-template0
Ethernet1/0	Policy pr01 applied to Ethernet1/0

display ipv6 policy-based-route setup

Syntax **display ipv6 policy-based-route setup** { *policy-name* | **interface** *interface-type interface-number* | **local** }

View Any view

Parameter *policy-name*: Policy name, a string of 1 to 19 characters.

interface *interface-type interface-number*: Displays policy routing information on the specified interface.

local: Displays system policy routing information.

Description Use the **display ipv6 policy-based-route setup** command to display specified IPv6 policy routing configuration information.

Example # Display specified IPv6 policy routing configuration information.

```
<Sysname> display ipv6 policy-based-route setup local
Local policy based routing configuration information:
ipv6 policy-based-route : test
  Node  6  permit :
    if-match acl6 2000
  Node  10  permit :
    apply destination-based-forwarding
```

Table 194 Description on fields of the display ipv6 policy-based-route setup command

Field	Description
ipv6 policy-based-route : test	Name of the referenced policy
Node 6 permit	The match mode of Node 6 is permit.
if-match acl6 2000	IPv6 packets matching IPv6 ACL 2000 are permitted.
Node 10 permit	The match mode of Node 10 is permit.
apply destination-based-forwarding	Enable destination based forwarding for denied IPv6 packets

display ipv6 policy-based-route statistics

Syntax **display ipv6 policy-based-route statistics** { **interface** *interface-type interface-number* | **local** }

View Any view

Parameter **interface** *interface-type interface-number*: Displays IPv6 policy routing statistics on the specified interface.

local: Displays IPv6 system policy routing statistics.

Description Use the **display ipv6 policy-based-route statistics** command to display IPv6 policy routing statistics.

Example # Display IPv6 system policy routing statistics.

```
<Sysname> display ipv6 policy-based-route statistics local
Local policy based routing information:
  ipv6 policy-based-route: test
  permit node 10
  Total packet dropped at node level: 0
 Total packet denied: 0, forwarded: 0
```

Table 195 Description on fields of the display ipv6 policy-based-route statistics command

Field	Description
Local policy based routing information	System policy routing information
ipv6 policy-based-route: test	Name of the referenced policy
Total packet dropped at node level: 0	Packets dropped by the node
Total packet denied: 0, forwarded: 0	Packets denied by the policy and packets forwarded by the policy

if-match acl6

Syntax **if-match acl6** *acl6-number*

undo if-match acl6

View IPv6 policy-based-route view

Parameter *acl6-number*: IPv6 ACL number, in the range 2000 to 3999. The number of a basic IPv6 ACL ranges from 2000 to 2999 and that of an advanced IPv6 ACL ranges from 3000 to 3999.

Description Use the **if-match acl6** command to define an IPv6 ACL match rule.

Use the **undo if-match acl6** command to remove the IPv6 ACL match rule.

Related command: **if-match packet-length**.

Example # Permit the packets matching ACL 2000.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 10
[Sysname-pbr6-aa-10] if-match acl6 2000
```

if-match packet-length

Syntax **if-match packet-length** *min-len max-len*

undo if-match packet-length

View IPv6 policy-based-route view

Parameter *min-len*: Minimum IPv6 packet length in bytes, in the range of 0 to 65535.

max-len: Maximum IPv6 packet length in bytes, in the range of 1 to 65535. The value of *max-len* must be no less than that of *min-len*.

Description Use the **if-match packet-length** command to define a packet length match rule.

Use the **undo if-match packet-length** command to remove the match rule.

Related command: **if-match acl6**.

Example # Match the IPv6 packets with a length from 100 to 200 bytes.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aa permit node 11
[Sysname-pbr6-aa-11] if-match packet-length 100 200
```

ipv6 local policy-based-route

Syntax **ipv6 local policy-based-route** *policy-name*

undo ipv6 local policy-based-route [*policy-name*]

View System view

Parameter *policy-name*: Policy name, which uniquely identifies an IPv6 policy routing. It is a string of 1 to 19 characters.

Description Use the **ipv6 local policy-based-route** command to enable IPv6 system policy routing and reference a policy.

Use the **undo ipv6 local policy-based-route** command to disable IPv6 system policy routing.

IPv6 system policy routing is disabled by default.

System policy routing is used to route packets generated locally. Unless otherwise required, you are not recommended to enable system policy routing.

Related command: **ipv6 local policy-based-route**.

Example # Enable IPv6 system policy routing and reference a policy named AAA.

```
<Sysname> system-view
[Sysname] ipv6 local policy-based-route AAA
```

ipv6 policy-based-route (interface view)

Syntax **ipv6 policy-based-route** *policy-name*

undo ipv6 policy-based-route

View Interface view

Parameter *policy-name*: Policy name, which uniquely identifies an IPv6 policy routing. It is a string of 1 to 19 characters.

Description Use the **ipv6 policy-based-route** command to enable IPv6 policy routing and reference a policy on the interface.

Use the **undo ipv6 policy-based-route** command to disable interface policy routing.

IPv6 interface policy routing is disabled by default.

Related command: **ipv6 local policy-based-route**.

Example # Enable IPv6 policy routing and reference a policy named AAA on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 policy-based-route AAA
```

ipv6 policy-based-route (system view)

Syntax **ipv6 policy-based-route** *policy-name* [**deny** | **permit**] **node** *node-number*

undo ipv6 policy-based-route *policy-name* [**deny** | **node** *node-number* | **permit**]

View System view

Parameter *policy-name*: Policy name, a string of 1 to 19 characters.

deny: Specifies the match mode of the policy node as **deny**. When a packet satisfies all rules defined by the **if-match** clauses, the packet will be denied by the

node and will not match against the next policy node. If not, the packet will match against the next policy node.

permit: Specifies the match mode of the policy node as **permit**. If a packet satisfies all the rules defined by the **if-match** clauses, the **apply** clauses are executed. If not, the packet will match against the next policy node.

node *node-number*: Number of the IPv6 policy node, in the range 0 to 65535. Packets will match against the node with a smaller *node-number* first.

Description Use the **ipv6 policy-based-route** command to create an IPv6 policy or policy node and enter IPv6 policy routing view.

Use the **undo ipv6 policy-based-route** command to remove an IPv6 policy or policy node.

No IPv6 policy or policy node is created by default.

An IPv6 policy may consist of several nodes, and a node consists of **if-match** clauses and **apply** clauses. The **if-match** clauses define the match rules for the node and the **apply** clauses define the actions that should be taken for matched packets.

Note that:

- There is an AND relationship between the **if-match** clauses of a node. That is to say, a packet must satisfy all matching rules specified by all **if match** clauses for the node before the action specified by the **apply** clause is taken.
- There is an OR relationship between nodes of the policy. That is, if a packet passes a node, it passes the policy.
- A packet passing a node of a policy will not go to the next node of the policy for a match.
- A packet not passing any node of a policy cannot pass the policy. It will be routed through the routing table.
- If multiple nodes are defined for a policy, the match mode of at least one node must be **permit**.

Related command: **ipv6 local policy-based-route**, **ipv6 local policy-based-route**, **if-match acl6**, **if-match packet-length**.

Example # Create Node 10 for the IPv6 policy "aaa" with match mode being permit and enter IPv6 policy routing view.

```
<Sysname> system-view
[Sysname] ipv6 policy-based-route aaa permit node 10
[Sysname-pbr6-aaa-10]
```

70 TERMINAL ACCESS CONFIGURATION COMMANDS

auto-close

Syntax **auto-close** *time*

undo auto-close

View Terminal template view

Parameters *time*: Automatic link teardown time, in seconds. It ranges from 5 to 240.

Description Use the **auto-close** command to configure the automatic link teardown time.

Use the **undo auto-close** command to restore the default. By default; the automatic link teardown time is 0 seconds, namely, no automatic link teardown is performed.

The terminal access feature supports the automatic link teardown function. You can enable the function and configure the teardown time in terminal template view. With this function enabled, if a terminal is disconnected from the router, the terminal enters the state of DOWN, and the router will automatically tear down the TCP connection to the front-end processor (FEP) after the specified time period. If the function is disabled, the TCP connection will always remain.

Example # Set the automatic link teardown time to 10 seconds.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] auto-close 10
```

auto-link

Syntax **auto-link** *time*

undo auto-link

View Terminal template view

Parameters *time*: Automatic link establishment time, in seconds. It ranges from 5 to 240.

Description Use the **auto-link** command to configure the automatic link establishment time.

Use the **undo auto-link** command to restore the default. By default, the automatic link establishment time is 0 seconds, namely, no automatic link establishment is performed.

The terminal access feature supports the automatic link establishment function. You can enable the function and configure the automatic link establishment time in terminal template view. When the terminal is in the "OK" state (meaning the physical connection is normal), the router automatically establishes a TCP connection to the remote router or FEP after the specified period of time. If the automatic link establishment function is disabled on the terminal, a link needs to established manually (manual link establishment is the default mode). The router establishes a TCP connection to the FEP only after a user enters a character on the terminal, except the special characters for hotkeys and terminals. Special characters are the characters that the terminals process directly, such as <Shift+F2>. For details, see the related manuals of terminals.

Example # Set the automatic link establishment time to 10 seconds.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] auto-link 10
```

bind vpn-instance

Syntax **bind vpn-instance** *vpn-name*

undo bind vpn-instance

View Terminal template view

Parameters *vpn-name*: VPN instance name, a string of 1 to 31 case-insensitive characters.

Description Use the **bind vpn-instance** command to bind a VPN instance with the terminal template. Use the **undo bind vpn-instance** command to remove the VPN instance binding.

By default, no VPN instance is bound with a terminal template.

This configuration is required when the TTY terminal access initiator also acts as an MPLS provider edge (PE) router at the same time. When you apply a terminal template configured with the **bind vpn-instance** command to an asynchronous interface, the terminal corresponding to the asynchronous interface is bound with the VPN instance. Thus, the terminal access initiator can group the terminals into different VPN domains. The RTC server can receive the connection request from any VPN without being configured with the **bind vpn-instance** command.

A template can be bound with only one VPN instance. If VPN instance binding is configured with this command for more than once, the latest configuration applies.

Example # Bind the VPN instance vpn1 with the terminal template.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] bind vpn-instance vpn1
```

data protect router-unix

Syntax **data protect router-unix**

undo data protect router-unix

View Terminal template view

Parameters None

Description Use the **data protect router-unix** command to enable data encryption between the router and the FEP.

Use the **undo data protect** command to restore the default.

By default, data encryption is disabled between the router and the FEP.

In terminal access, you can configure whether to encrypt the data exchanged between the router and the FEP. The supported encryption algorithm is AES (advanced encryption standard) and the supported key length is 128-bit.

Example # Enable the data encryption between the router and the FEP.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] data protect router-unix
```

data read block

Syntax **data read block**

undo data read block

View Terminal template view

Parameters None

Description Use the **data read block** command to enable data read blocking.

Use the **undo data read block** command to restore the default.

By default, data read blocking is disabled.

Note that, if data read blocking is enabled, when the router fails to send data from the terminal, the router stops receiving data from the terminal until the data is sent successfully.

Example # Enable data read blocking.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] data read block
```

data send delay

Syntax **data send delay** *milliseconds*

undo data send delay

View Terminal template view

Parameters *milliseconds*: Data send delay, in *milliseconds, ranging* 1 to 1,000.

Description Use the **data send delay** command to set the data send delay of the terminal.

Use the **undo data send delay** command to restore the default.

By default; the data send delay is 0 milliseconds, namely, there is no data send delay.

A router configured with data send delay begins to send the data received from a terminal to an FEP after the configured data send delay time expires.

Example # Set the data send delay time to 50 milliseconds.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] data send delay 50
```

display rta

Syntax **display rta** { **all** | **statistics** | *terminal-number* { **brief** | **detail** | **statistics** | *vty-number* } }

View Any view

Parameters **all**: Displays information about all the terminals.

statistics: Displays terminal statistics.

terminal-number: Terminal number, ranging 1 to 255.

brief: Displays brief information about the specified terminal.

detail: Displays detailed information about the specified terminal.

vty-number: Displays information about the specified VTY. VTY number ranges from 0 to 7.

Description Use the **display rta** command to display information about terminals.

Relate command: **reset rta statistics**.

Example # Display the information about the terminal VTY1.

```
<Sysname> display rta 1 1
VTY 1
    APP Index: 0
    APP Type: TTY
    APP Name: (null)
    APP State: Kept
    Remote IP: 192.168.0.110
    Source IP: 0.0.0.0
    Actual Source IP: 0.0.0.0
    Remote Port: 9010
    Local Port: 0
    Encrypt Now: no
    Receive remote buffer address: 593c904
    Receive buffer head: 499
    Receive buffer tail: 499
    Time from APP is linked till now: 00h00m00s
```

Table 196 Description on the fields of the display rta terminal-number vty-number command

Field	Description
APP Index	Application index
APP Type	Application type: TTY, Telnet, RTC client, or RTC server
APP Name	Application name. It defaults to "null".
APP State	Application state: Kept, Linking, Linked, Disconnect, meaning respectively not connected, being connected, connected, disconnected.
Remote IP	Remote IP address
Source IP	Source IP address, namely, the source IP address configured for the VTY under the terminal template
Actual Source IP	Actual source IP address, namely, the source IP address used for establishing a connection. This field applies only when the global source IP address for terminal access is configured or when the source IP address is configured for the VTY under the terminal template. In any other cases, it is 0.0.0.0.
Remote Port	Remote port
Local Port	Local port
Encrypt Now	Whether to encrypt data
Receive remote buffer address	Buffer address for receiving remote data
Receive buffer head	Receive buffer head
Receive buffer tail	Receive buffer tail
Time from APP is linked till now	Time since the application was connected

Display brief information about TTY 1.

```
<Sysname> display rta 1 brief
TTY 1
```

```
Interface Used         :  Async1/0
Current State          :  Ok
Flow Control           :  Stop
Current Debug          :  0x3c
Current VTY            :  0
Current APP            :  0

```

Table 197 Description on the fields of the display rta terminal-number brief command

Field	Description
TTY 1	TTY" indicates the terminal access type and "1" the terminal number.
Interface Used	Physical interface corresponding to the terminal number
Current State	Current terminal state: Down, OK, and Menu, respectively meaning physical connection down, physical connection normal, and menu state.
Flow Control	Flow control for the current application: Start or Stop, meaning starting not to receive data from the FEP or starting to receive data from the FEP
Current Debug	Whether current debugging is enabled or disabled
Current VTY	Currently operating VTY
Current APP	Current application
APP Type	Application type
APP Name	Application name
APP State	Application state
Socket RecvBuf Size	TCP receive buffer size
Socket SendBuf Size	TCP send buffer size
TTY Recv Bytes	Received data in bytes
TTY Send Bytes	Transmitted data in bytes
Last Recv Time	Time when last data was received
Last Send Time	Time when last data was sent
Current VTY Recv	Data, in bytes, received by the current VTY

Table 197 Description on the fields of the display rta terminal-number brief command

Field	Description
Current VTY Send	Data, in bytes, sent by the current VTY
Current APP Recv	Data, in bytes, received by the current application
Current APP Send	Data, in bytes, sent by the current application
Time from APP is linked	Time since the application was connected
Encrypt(Router to Unix)	Whether to encrypt data
Receive Remote Buffer Address	Buffer address for receiving remote data
Receive Buffer Tail	Receive buffer head
Receive Buffer Tail	Receive buffer tail
VTY APP Type State	VTY list configured on the terminal. "VTY" represents VTY number; "APP" represents application; "Type" represents application type; "State" represents application state.

Display statistics about terminal 1.

```
<Sysname> display rta 1 statistics
TTY 1
  Receive from terminal: 0
  Send to terminal:      0
  Receive from remote:   0
  Send to remote:        0

  VTY 0
    Receive from terminal: 0              Last receive time: 00:00:00
    Send to terminal:      0              Last send time:    00:00:00
    Receive from remote:   0              Last receive time: 00:00:00
    Send to remote:        0              Last send time:    00:00:00
```

Table 198 Description on the fields of the display rta terminal-number statistics command

Field	Description
Receive from terminal	Data, in bytes, received from the terminal
Send to terminal	Data, in bytes, sent to the terminal
Receive from remote	Data, in bytes, received from the remote terminal
Send to remote	Data, in bytes, sent to the remote terminal
Last receive time	Time when last data was received
Last send time	Time when last data was sent

Display all the information about terminal access.

```
<Sysname> display rta all
TTYID    TTY State    Current VTY    Current APP    APP Type    APP State
1        OK           0              0              TTY         Kept
```

Table 199 Description on the fields of the display rta all command

Field	Description
TTYID	Terminal number
TTY State	Terminal state
Current VTY	VTY currently operating on the terminal
Current APP	Current application
APP Type	Application type

Table 199 Description on the fields of the display rta all command

Field	Description
APP State	Application state

Display terminal access statistics

```
<Sysname> display rta statistics
    RTA Template Number: 2
    RTA TTY Number: 1
    RTA APP Number: 1
    RTA Listen Port Number: 0
```

Table 200 Description on the fields of the display rta statistics command

Field	Description
RTA Template Number	Number of terminal templates configured on the router
RTA TTY Number	Number of terminals configured on the router
RTA APP Number	Number of applications generated after terminal configuration
RTA Listen Port Number	Number of listening ports on the router

driverbuf save

Syntax **driverbuf save**

undo driverbuf save

View Terminal template view

Parameters None

Description Use the **driverbuf save** command to configure the router not to clear the terminal receive buffer after the TCP connection is established

Use the **undo driverbuf save** command to restore the default.

By default, the router clears the terminal receive buffer after the TCP connection is established.

Terminal receive buffer is the buffer used on a router to store terminal data.

Example # Configure not to clear the terminal receive buffer after the TCP connection is established

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] driverbuf save
```

driverbuf size

Syntax **driverbuf size** *number*

undo driverbuf size

View Terminal template view

Parameters *number*: Buffer size, in kilobytes (KB), ranging from 8 to 32.

Description Use the **driverbuf size** command to configure the size of terminal receive buffer.

Use the **undo driverbuf size** command to restore the default setting.

By default, the size of terminal receiver buffer is 8 KB.

Note that this command takes effect only after the template is reapplied on the interface.

Example # Set the terminal buffer size to 8 KB.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] driverbuf size 8
```

idle-timeout

Syntax **idle-timeout** *seconds*

undo idle-timeout

View Terminal template view

Parameters *seconds*: Connection idle timeout time, in seconds, ranging 10 to 3,600.

Description Use the **idle-timeout** command to set the TCP connection idle timeout time for terminal access.

Use the **undo idle-timeout** command to restore the default.

By default, the terminal access idle timeout time is 0 seconds; that is, the TCP connection never times out.

With the idle timeout time configured, if no data is transmitted over the terminal access connection in the specified period of time, the connection is automatically torn down.

Example # Set the terminal access idle timeout time to 1,000 seconds.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] idle-timeout 1000
```

menu hotkey

Syntax **menu hotkey** *ascii-code*&<1-3>

undo menu hotkey

View Terminal template view

Parameters *ascii-code*&<1-3>: ASCII value of hotkey, ranging 1 to 255. "&<1-3>" means that you can provide up to three hotkey ASCII values.

Description Use the **menu hotkey** command to configure the menu hotkey.

Use the **undo menu hotkey** command to cancel the menu hotkey configured.

By default, no menu hotkey is configured.

If the current terminal operates on the service interface, you can switch to the menu interface by entering the menu hotkey configured.

RTC terminal access does not support the menu function.

Note:

- The ASCII value of the hotkey must be different from that of any other hotkey configured on the device. Otherwise, hotkey conflicts will occur. For example, the hotkey value cannot be set to 17 or 19 because these two values are used for the hotkeys of flow control.
- Using the hotkey may not get a response rapidly when the terminal displays too much data.
- Before using this command, make sure you enable the router to print characters to the terminal and enable menu printing.

Related command: **print information** and **print menu**.

Example # Configure the hotkey for switching to the menu as <Alt+A>, whose corresponding ASCII codes are a combination of 1, 96, and 13.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] menu hotkey 1 96 13
```

menu screencode

Syntax **menu screencode** *string*

undo menu screencode

View Terminal template view

Parameters *string*: Screen code of the terminal, containing 1 to 15 case-insensitive characters.

Description Use the **menu screencode** command to configure a menu screen code.

Use the **undo menu screencode** command to remove the menu screen code.

By default, no such a screen code is configured.

Some types of terminals provide the screen saving function. When such a terminal receives a specific screen code, such as E!10Q (for details about screen codes, refer to the related terminal manuals), it saves the current interface and switch to the corresponding screen.

Note that this function requires terminal support and the screen code configured on the router and that specified on the terminal must be the same. Screen codes vary with terminal types. For details, refer to the corresponding terminal manuals. For example, Start terminals support E!8Q, E!9Q, E!10Q, E!11Q, E!12Q, and E!13Q.

Example # Configure a menu screencode of E!10Q.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc]menu screencode E!10Q
```

print connection-info

Syntax **print connection-info**

undo print connection-info

View Terminal template view

Parameters None

Description Use the **print connection-info** command to enable the printing of terminal connection information on the terminal.

Use the **undo print connection-info** command to disable the printing of terminal connection information.

By default, terminal connection information is printed on the terminal.

To facilitate your operation, after a TCP connection is established between the terminal and the FEP, the terminal will display a message indicating that the connection is successful. To disable the prompt message from being displayed, use the **undo print connection-info** command.

Make sure you enable the router to print characters on the terminal before using this command.

Related command: **print information**.

Example # Enable the printing of terminal connection information on the terminal

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] print connection-info
```

print information

Syntax **print information**

undo print information

View Terminal template view

Parameters None

Description Use the **print information** command to enable the router to print characters on the terminal.

Use the **undo print information** command to disable the router from printing characters on the terminal.

By default, the router can print characters on the terminal.

You can use this command when the terminal is connected to a printer for printing.

Related command: **print connection-info** and **print menu**.

Example # Disable the router from printing characters on the terminal.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] undo print information
```

print menu

Syntax **print menu**

undo print menu

View Terminal template view

Parameters None

Description Use the **print menu** command to print menu information on the terminal.

Use the **undo print menu** command to disable the printing of terminal menu information.

By default, terminal menu information is printed.

This command takes effect only in TTY and Telnet terminal access. Make sure you enable the router to print characters on the terminal before using this command.

Related command: **print information**.

Example # Enable the printing of terminal menu information on the terminal

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] print menu
```

print language

Syntax **print language** { **chinese** | **english** }

View Terminal template view

Parameters **chinese**: Prints prompt information in Chinese.

english: Prints prompt information in English.

Description Use the **print language** command to set the language of the printed prompt information.

By default, the prompt information is printed in Chinese on the terminal.

Example # Set the language of the prompt information printed on the terminal to English.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] print language english
```

redrawkey

Syntax **redrawkey** *ascii-code*&<1-3>

undo redrawkey

View Terminal template view

Parameters *ascii-code*&<1-3>: ASCII value of hotkey, ranging 1 to 255. "&<1-3>" means that you can provide up to three ASCII values.

Description Use the **redrawkey** command to set the hotkey for terminal redrawing.

Use the **undo redrawkey** command to cancel the hotkey configured for terminal redrawing.

By default, no hotkey is configured for terminal redrawing.

The terminal redrawing hotkey can be set in TTY terminal access only. Terminal redrawing works in a similar way as the screen saving function of VTY switching. When a terminal does not exhibit the normal terminal interface for some reasons (for example, when illegible characters appear), pressing the terminal redrawing hotkey can restore the original terminal interface.

- *Before performing terminal redrawing, you must add the screen 1 command to the configuration file ttyd on the FEP.*
- *The ASCII value of the redrawing hotkey configured must be different from that of any other hotkey configured on the device. Otherwise, hotkey conflicts will occur. For example, the hotkey value cannot be set to 17 or 19 because these two values are used for the hotkeys of flow control.*
- *Using the hotkey may not get a response rapidly when the terminal displays too much data.*

Example # Configure the terminal redrawing hotkey as <Ctrl+A> by setting its ASCII value to 1.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] redrawkey 1
```

reset rta connection

Syntax **reset rta connection** *terminal-number vty-number*

View User view

Parameters *terminal-number*: Terminal number, ranging 1 to 255.

vty-number: VTY number, ranging 0 to 7.

Description Use the **reset rta connection** command to forcibly tear down the TCP connection corresponding to a VTY of a terminal.

Example # Tear down the TCP connection corresponding to terminal 1.

```
<Sysname> reset rta connection 1 1
```

reset rta statistics

Syntax **reset rta statistics** *terminal-number*

View User view

Parameters *terminal-number*: Terminal number, ranging 1 to 255.

Description Use the **reset rta statistics** command to clear the statistics of a terminal.

Related command: **display rta**.

Example # Clear all the statistics about terminal 1.

```
<Sysname> reset rta statistics 1
```

resetkey

Syntax **resetkey** *ascii-code*&<1-3>

undo resetkey

View Terminal template view

Parameters *ascii-code*&<1-3>: ASCII value of a hotkey, ranging 1 to 255. "&<1-3>" means that you can provide up to three ASCII values.

Description Use the **resetkey** command to set the terminal reset hotkey.

Use the **undo resetkey** command to cancel the configured terminal reset hotkey.

By default, no terminal reset hotkey is configured.

After you press the terminal reset hotkey when a terminal fault occurs, the router tears down and then reestablishes the TCP connection with the FEP.

Note that the ASCII value of the redrawing hotkey configured must be different from that of any other hotkey configured on the device. Otherwise, hotkey conflicts will occur. For example, the hotkey value cannot be set to 17 or 19 because these two values are used for the hotkeys of flow control. Using the hotkey may not get a response rapidly when the terminal displays too much data.

Example # Configure the terminal reset hotkey as <Ctrl+A> by setting its ASCII value to 1.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] resetkey 1
```

rta bind

Syntax **rta bind** { **mac-address interface** *interface-type interface-number* | **string** *string* }

undo rta bind

View System view

Parameters **mac-address interface** *interface-type interface-number*: Uses the specified interface MAC address as the character string for router authentication. *interface-type interface-number*: Specifies a port by port type and port number.

string *string*: Uses a user-defined string for router authentication. *string* is a user-defined string of 1 to 30 characters.

Description Use the **rta bind** command to configure a character string for router authentication.

Use the **undo rta bind** command to restore the default.

By default, no authentication string is configured on the router.

This configuration is used to authenticate the connection between the router and the FEP. If the authentication succeeds (that is, the MAC address sent by the router and that configured on the FEP are consistent), the connection is established; otherwise, no connection can be established between the router and the FEP.

- *Only a MAC address or a character string can be configured at a time, and the latest configured one takes effect.*
- *The authentication type and character string configured on the router and FEP must be the same. Otherwise, the authentication fails and no connection can be established.*

Example # Bind the MAC address of Ethernet 0/0 for router authentication.

```
<Sysname> system-view
[Sysname] rta bind mac-address interface ethernet 0/0
```

Bind the character string abc for router authentication.

```
<Sysname> system-view
[Sysname] rta bind string abc
```

rta rtc-server listen-port

Syntax **rta rtc-server listen-port** *port-number*

undo rta rtc-server listen-port *port-number*

View System view

Parameters *port-number*: Listening TCP port number of the RTC server, ranging 1024 to 50000.

Description Use the **rta rtc-server listen-port** command to configure the listening port on the RTC server.

Use the **undo rta rtc-server listen-port** command to cancel the configured listening port.

By default, no listening port is configured on the RTC server.

Note that only one listening port can be configured.

Example # Configure the RTC server listening port number as 9010.

```
<Sysname> system-view
[Sysname] rta rtc-server listen-port 9010
```

rta server enable

Syntax **rta server enable**

undo rta server enable

View System view

Parameters None

Description Use the **rta server enable** command to enable terminal access on the router.

Use the **undo rta server enable** command to disable terminal access.

By default, terminal access is disabled on the router.

Note that, after terminal access is disabled, the settings of template, terminal, and VTY will be kept.

Example # Enable terminal access.

```
<Sysname> system-view
[Sysname] rta server enable
```

rta source-ip

Syntax **rta source-ip** *ip-address*

undo rta source-ip

View System view

Parameters *ip-address*: Source IP address used for establishing a TCP connection. It cannot be a loopback address, such as 127.0.0.1.

Description Use the **rta source-ip** command to configure the global source IP address of TCP connections.

Use the **undo rta source-ip** command to cancel the source IP address configured.

By default, no source IP address is configured globally for TCP connections.

- *You can use this command to configure an IP address other than the outbound interface's IP address of the initiating router as the TCP connection source IP address. Generally, the loopback interface or dialer interface of the router are used as the TCP connection source IP address for dial-up backup and address hiding.*
- *If a source IP address is also configured in a terminal template, this address is preferred as the source IP address for the corresponding terminal to establish TCP connections.*
- *After the global TCP connection source IP address is configured, a TCP connection must be reestablished for this address to take effect.*

Example # Set the global TCP connection source IP address to 1.1.1.1.

```
<Sysname> system-view
[Sysname] rta source-ip 1.1.1.1
```

rta template

Syntax **rta template** *template-name*

undo rta template *template-name*

View System view

Parameters *template-name*: Terminal template name, a string of 1 to 15 characters.

Description Use the **rta template** command to create a terminal template and enter terminal template view. If you specify an existing terminal template, you will enter the corresponding terminal template view.

Use the **undo rta template** command to delete a terminal template.

Example # Create terminal template abc and enter terminal template view.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc]
```

rta terminal

Syntax **rta terminal** *template-name terminal-number*

undo rta terminal

View Interface view

Parameters *template-name*: Terminal template name, a string of 1 to 15 characters.

terminal-number: Terminal number, ranging 1 to 255.

Description Use the **rta terminal** command to apply a template on the interface.

Use the **undo rta terminal** command to cancel the template application.

By default, no template is applied on the interface.

A terminal can be created only after the configured template is applied on the corresponding interface, so as to implement terminal access. Use the *terminal-number* argument to specify the terminal number. An interface can be connected to only one physical terminal. The router identifies physical terminals by terminal number.

Note that at least one VTY should be configured in the terminal template for the template to be applied on the interface. This command supports asynchronous serial interfaces, synchronous/asynchronous serial interfaces, and AUX interfaces. This command can be configured on a synchronous/asynchronous serial interface only when the interface operates in the asynchronous mode.

Example # Apply the terminal template abc with the terminal number of 1 on the interface.

```
<Sysname> system-view
[Sysname] interface async 1/1
[Sysname-rta-async1/1] rta terminal abc 1
```

sendbuf bufsize

Syntax **sendbuf bufsize** *size*

undo sendbuf bufsize

View Terminal template view

Parameters *size:* Maximum size of data sent to the terminal at one time, in bytes, ranging 2 to 500.

Description Use the **sendbuf bufsize** command to configure the maximum size of data to be sent to the terminal.

Use the **undo sendbuf bufsize** command to restore the default.

By default, the maximum size of data to be sent to the terminal at one time is 500 byes.

The router sends data in packets to the terminal. The sizes of the sent packets are different. Use the *size* argument to specify the maximum data packet size.

Example # Configure the maximum size of data to be sent at one time as 200 bytes.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] sendbuf bufsize 200
```

sendbuf threshold

Syntax **sendbuf threshold** *value*

undo sendbuf threshold

View Terminal template view

Parameters *value*: Threshold of terminal send buffer, in bytes, ranging 50 to 2,048.

Description Use the **sendbuf threshold** command to set the threshold of the terminal send buffer.

Use the **undo sendbuf threshold** command to cancel the configured threshold of the terminal send buffer.

By default, no threshold is configured.

The send buffer is used to store the data that the router is to send to the terminal. The threshold specifies the maximum data in bytes that the send buffer can store.

Example # Set the terminal send buffer threshold to 1,000 bytes.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] sendbuf threshold 1000
```

tcp

Syntax **tcp** { **keepalive** *time count* | **nodelay** | **recvbuf-size** *recvsize* | **sendbuf-size** *sendsize* }

undo tcp { **keepalive** | **nodelay** | **recvbuf-size** | **sendbuf-size** }

View Terminal template view

Parameters **keepalive** *time count*: Sets the parameters for sending TCP keepalives. *time* indicates the interval for sending keepalives, in seconds, ranging 10 to 7,200. *count* indicates the keepalive retransmission times, ranging 1 to 100.

nodelay: Specifies not to use the TCP Nagle algorithm, that is, no TCP delay.

recvbuf-size *recvsize*: TCP receive buffer size, in bytes, ranging 512 to 16,384.

sendbuf-size *sendsize*: TCP send buffer size, in bytes, ranging 512 to 16,384.

Description Use the **tcp** command to configure TCP parameters, including receive buffer size, send buffer size, no delay, keepalive interval, and number of keepalives to be sent.

Use the **undo tcp** command to restore the default TCP settings.

By default, receive buffer size is 2,048 bytes, send buffer size is 2,048 bytes, delay is enabled, keepalive interval is 50 seconds, and the number of keepalives is 3.

If you specify the **nodelay** keyword, the TCP Nagle algorithm will not be used.

Note that the newly configured TCP parameters take effect only after the connection is reestablished.

Example # Set the TCP receive buffer size to 512 bytes.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] tcp recvbuf-size 512
```

Set the TCP send buffer size to 512 bytes.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] tcp sendbuf-size 512
```

Disable TCP delay.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] tcp nodelay
```

Set the TCP keepalive interval to 1,800 seconds and the number of keepalives to 2.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] tcp keepalive 1800 2
```

testkey

Syntax **testkey** *ascii-code*&<1-3>

undo testkey

View Terminal template view

Parameters *ascii-code*&<1-3>: ASCII value of the hotkey, ranging 1 to 255. "&<1-3>" means that you can provide up to three ASCII values.

Description Use the **testkey** command to configure the terminal connectivity test hotkey.

Use the **undo testkey** command to cancel the hotkey configured.

By default, no hotkey is configured for connectivity test.

With the terminal connectivity test hotkey configured on the router, you can press the hotkey to test the TCP connectivity between the terminal and the router and that between the terminal and the FEP.

- *This command takes effect only in Telnet terminal access and TTY terminal access.*
- *The ASCII value of the hotkey configured must be different from that of any other hotkey configured on the device. Otherwise, hotkey conflicts will occur. For example, the hotkey value cannot be set to 17 or 19 because these two values are used for the hotkeys of flow control.*
- *Using the hotkey may not get a response rapidly when the terminal displays too much data.*

Example # Configure the terminal connectivity test hotkey as <Alt+A>, namely, 1 96 13.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] testkey 1 96 13
```

update changed-config

Syntax **update changed-config**

View Terminal template view

Parameters None

Description Use the **update changed-config** command to update template configurations.

If the template has been applied on the corresponding interface, the configurations made in template view will take effect after the **update changed-config** command is executed. You are recommended to complete all terminal template configurations before applying the template on the interface.

Note that some configurations, such as source IP address configuration and encryption, take effect only after they are updated and the connection is reestablished.

Example # Set the menu hotkey under the template and update the configuration for the hotkey to take effect.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] menu hotkey 1
[Sysname-rta-template-abc] update changed-config
```

vty description

Syntax **vty** *vty-number* **description** *string*

undo vty *vty-number* **description**

View Terminal template view

Parameters *vty-number*: VTY number, ranging 0 to 7.

string: VTY description, a string of 1 to 31 characters.

Description Use the **vty description** command to configure a description for a VTY.

Use the **undo vty description** command to remove the description for a VTY.

By default, no description is configured for a VTY.

For a VTY of a service, you are recommended to use the service name as the description information of the VTY for convenience.

Example # Set the description information of VTY 1 to chuxu.

```
<Sysname> system-view
[Sysname] rta template abc

```

vty hotkey

Syntax **vty** *vty-number* **hotkey** *ascii-code*&<1-3>

undo vty *vty-number* **hotkey**

View Terminal template view

Parameters *vty-number*: VTY number, ranging 0 to 7.

ascii-code&<1-3>: ASCII value of the hotkey, ranging 1 to 255. "&<1-3>" means that you can provide up to three ASCII values.

Description Use the **vty** *vty-number* **hotkey** command to set the hotkey for VTY fast switching.

Use the **undo vty** *vty-number* **hotkey** command to cancel the hotkey configured.

By default, no hotkey is configured for VTY fast switching.

Terminal access supports VTY switching, allowing you to switch between applications. In terminal access, each terminal can be logically divided into eight

VTYs and each VTY corresponds to one application. When multiple VTYs are configured on a terminal with the corresponding switching hotkeys, you can press the switching hotkeys to quickly switch between the VTYs without making any selection on the menu. The connection of the original VTY application is not torn down. This way, dynamic switching between the VTYs (namely, different applications) on a terminal is implemented.

Note that the ASCII value of the hotkey configured must be different from that of any other hotkey configured on the device. Otherwise, hotkey conflicts will occur. For example, the hotkey value cannot be set to 17 or 19 because these two values are used for the hotkeys of flow control. Using a hotkey may not get a response rapidly when the terminal displays too much data.

Example # Configure the hotkey for VTY 1 as <Ctrl+A>, namely, 1.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty 1 hotkey 1
```

vty password

Syntax **vty** *vty-number* **password** { **simple** | **cipher** } *string*

undo vty *vty-number* **password**

View Terminal template view

Parameters *vty-number*: VTY number, ranging 0 to 7.

simple: Uses a plaint-text password that is displayed in plain text.

cipher: Uses a ciphertext password that is displayed in ciphertext.

string: Password. It is a plain-text string of 1 to 16 characters or a ciphertext string of 24 characters.

Description Use the **vty password** command to configure the password for VTY authentication.

Use the **undo vty password** command to cancel the password configured.

By default, no password is configured for VTY authentication.

Note that this command takes effect in RTC terminal access only and is used by the RTC server to authenticate RTC clients. To support terminal access authentication, passwords must be configured on the RTC server and the RTC clients, and authentication succeeds only if the passwords are the same. If authentication is not to be implemented, make sure no password is configured on the RTC server or any RTC client.

Example # Configure the authentication password for VTY 1 as abc.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty 1 password simple abc
```

vty rtc-client remote

Syntax **vty** *vty-number* **rtc-client remote** *ip-address port-number* [**source** *source-ip*]

undo vty *vty-number*

View Terminal template view

Parameters *vty-number*: VTY number, ranging 0 to 7.

ip-address: IP address of the RTC server.

port-number: Listening port number of the RTC server, ranging 1024 to 50000.

source *source-ip*: Source IP address bound.

Description Use the **vty rtc-client remote** command to create a VTY to serve as an RTC client.

Use the **undo vty** command to remove the specified VTY.

Note that, after this configuration, no more Telnet VTYs, TTY VTYs, or RTC server VTYs can be configured in the template of the VTY.

Related command: **rta rtc-server listen-port** and **vty rtc-server remote**.

Example # Create VTY 1 to serve as an RTC client, setting the IP address of the corresponding RTC server to 1.1.1.1, the listening port of the RTC server to 9010, and the source IP address to be used for establishing TCP connections to 2.2.2.2.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty 1 rtc-client remote 1.1.1.1 9010 source 2.2.2.2
```

vty rtc-server remote

Syntax **vty** *vty-number* **rtc-server remote** *ip-address terminal-number*

undo vty *vty-number*

View Terminal template view

Parameters *vty-number*: VTY number, ranging 0 to 7.

ip-address: RTC client IP address.

terminal-number: Terminal number corresponding to the RTC client, ranging 1 to 255.

Description Use the **vty rtc-server remote** command to create a VTY to serve as the RTC server.

Use the **undo vty** command to remove the specified VTY.

Note that, after this configuration, no more Telnet VTYs, TTY VTYs, or RTC client VTYs can be configured in the template of the VTY.

Example # Create a VTY to serve as the RTC server, setting the IP address of the RTC client to 2.2.2.2 and the terminal number to 1.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty 1 rtc-server remote 2.2.2.2 1
```

vty screencode

Syntax **vty** *vty-number* **screencode** *string*

undo vty *vty-number* **screencode**

View Terminal template view

Parameters *vty-number*: VTY number, ranging 0 to 7.

string: Terminal screen code, a string of 1 to 15 characters.

Description Use the **vty screencode** command to set the screen code for triggering screen saving.

Use the **undo vty screencode** command to cancel the screen code configured.

By default, no screen code is configured for terminal screen saving.

Some types of terminals provide the screen saving function. When such a terminal receives the specified screen code, such as E!10Q (for details about screen codes, refer to the related terminal manuals), it saves the current interface and switch to the corresponding screen.

Note that this function requires terminal support and the screen code configured on the router and that specified on the terminal must be the same. Screen codes configured vary with terminal types. For details, refer to the corresponding terminal manuals. For example, Start terminals support E!8Q, E!9Q, E!10Q, E!11Q, E!12Q, and E!13Q. To support screen saving and menu printing, the **menu screencode** command must be used.

Related command: **menu screencode**.

Example # Set the screen code for VTY 1 to E!9Q.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty 1 screencode E!9Q
```

vty telnet remote

Syntax **vty** *vty-number* **telnet remote** *ip-address* [*port-number*] [**source** *source-ip*]

undo vty *vty-number*

View Terminal template view

Parameters *vty-number*: VTY number, ranging 0 to 7.

ip-address: FEP IP address.

port-number: Listening Telnet port on the FEP. It ranges 1 to 50000 and defaults to 23.

source *source-ip*: Source IP address bound.

Description Use the **vty telnet remote** command to create a VTY for Telnet terminal access.

Use the **undo vty** command to remove the specified VTY.

Note that, after this configuration, no more RTC client VTYs or RTC server VTYs can be configured in the template of the VTY.

Example # Create a VTY for Telnet terminal access, setting the FEP IP address to 1.1.1.1.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty 1 telnet remote 1.1.1.1
```

vty tty remote

Syntax **vty** *vty-number* **tty remote** *ip-address port-number* [**source** *source-ip*]

undo vty *vty-number*

View Terminal template view

Parameters *vty-number*: VTY number, ranging 0 to 7.

ip-address: FEP IP address.

port-number: Listening port number of the ttyd program on the FEP, ranging 1024 to 50000.

source *source-ip*: Source IP address bound.

Description Use the **vty tty remote** command to create a VTY for TTY terminal access.

Use the **undo vty** command to remove the specified VTY.

Note that, after this configuration, no more RTC client VTYs or RTC server VTYs can be configured in the template of the VTY.

Example # Create VTY 1 for TTY terminal access, setting FEP IP address to 1.1.1.1, listening port number to 9010, and source IP address to 2.2.2.2.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty 1 tty remote 1.1.1.1 9010 source 2.2.2.2
```

vty-switch priority

Syntax **vty-switch priority**

undo vty-switch priority

View Terminal template view

Parameters None

Description Use the **vty-switch priority** command to configure the RTC server to perform VTY switching based on priority.

Use the **undo vty-switch priority** command to restore the default setting.

By default, the VTY switching is performed not based on priority.

This command takes effect in RTC terminal access. When VTY switching is performed based on priority (the lower the VTY number, the higher the priority), if the VTY number corresponding to the connection request received is less than the VTY number corresponding to the existing connection, the RTC server tears down the existing connection and begins to use the new connection for communication. If a connection has been established and this command is not used, any newer connection will be torn down.

Example # Configure the RTC server to perform VTY switching based on priority.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty-switch priority
```

vty-switch threshold

Syntax **vty-switch threshold** *times*

undo vty-switch threshold

View Terminal template view

Parameters *times*: Threshold for VTY automatic switching, in times, ranging 1 to 1,0000.

Description Use the **vty-switch threshold** command to configure the threshold for VTY automatic switching.

Use the **undo vty-switch threshold** command to restore the default.

By default, no threshold is configured; that is, no switching is performed.

Note that this command takes effect only in RTC client terminal access. After this configuration, when an RTC client needs to initiate a connection to an RTC server, it first initiates a connection to the RTC server with the lowest VTY number. If the number of connection failures exceeds the threshold, the RTC client initiates a connection to the RTC server with the second lowest VTY number.

Example # Set the threshold for automatic VTY switching.

```
<Sysname> system-view
[Sysname] rta template abc
[Sysname-rta-template-abc] vty-switch threshold 5
```

71 IP ROUTING TABLE COMMANDS

bandwidth-based-sharing

Syntax **bandwidth-based-sharing**

undo bandwidth-based-sharing

View System view

Parameters None

Description Use the **bandwidth-based-sharing** command to enable bandwidth-based load sharing.

Use the **undo bandwidth-based-sharing** command to disable bandwidth-based load sharing.

By default, bandwidth-based load sharing is disabled.

If multiple outbound interfaces/nexthops to a destination are found during forwarding:

- When bandwidth-based load sharing is disabled, the packets are forwarded through all these interfaces in turn.
- When bandwidth-based load sharing is enabled, the device calculates the packet forwarding proportion for each interface based on the bandwidths and then determines through which interfaces to forward the subsequent packets (the number of packets already forwarded through these interfaces is considered).

Examples # Enable bandwidth-based load sharing.

```
<Sysname> system-view
[Sysname] bandwidth-based-sharing
```

display ip routing-table

Syntax **display ip routing-table** [**vpn-instance** *vpn-instance-name*] [**verbose**] | { **begin** | **exclude** | **include** } *regular-expression*]

View Any view

Parameters **vpn-instance** *vpn-instance-name*: Displays routing table information for a VPN instance. The *vpn-instance-name* argument represents the instance name and is a string of 1 to 31 characters.

verbose: Displays detailed routing table information, including that for inactive routes. With this argument absent, the command displays only summary information about active routes.

|: Uses a regular expression to filter output information.

begin: Displays routing table entries starting from the one specified by the regular expression.

include: Displays routing table entries specified by the regular expression.

exclude: Displays routing table entries other than those specified by the regular expression.

regular-expression: Regular expression for filtering routing table entries, a string of 1 to 256 characters.

Table 201 Special characters for regular expressions

Character	Meaning	Remarks
_	Underscore, functions similarly as a wildcard and matches one of the following:	If it is not the first character in a regular expression, it can appear as many times as the command line length permits.
	(^|$|[,(){}])	If it is the first character in a regular expression, it can be followed with up to four underscores.
	or a space, the beginning of a string, the end of a string.	If it appears intermittently in a regular expression, only the first group takes effect.
(	Left parenthesis, represents a stack push operation in a program.	It is not recommended to use this character in a regular expression.
.	Full stop, a wildcard that matches any character, including a space.	-
*	Asterisk, indicates that the character(s) to its left can appear 0 or more times.	zo* matches z and zoo.
+	Plus, indicates that the character(s) to its left can appear one or more times.	zo+ matches zo and zoo, but not z.

Description Use the **display ip routing-table** command to display brief information about active routes in the routing table.

Use the **display ip routing-table verbose** command to display detailed information about all routes in the routing table.

Examples # Display brief information about active routes in the routing table.

```
<Sysname> display ip routing-table
Routing Tables: Public
         Destinations : 6        Routes : 6

      State: Active NoAdv           Age: 00h00m36s
        Tag: 0
```

Displayed first are statistics for the whole routing table, followed by detailed description of each route (in sequence).

Table 203 Description on the fields of the display ip routing-table verbose command

Field	Description
Destination	Destination address/mask length
Protocol	Protocol that presents the route
Process ID	Process ID
Preference	Priority of the route
Cost	Cost of the route
NextHop	Address of the next hop on the route
Interface	Outbound interface for packets to be forwarded along the route
RelyNextHop	The next hop address obtained through routing stack.
Neighbour	Neighboring address determined by Routing Protocol
Tunnel ID	Tunnel ID
Label	Label
State	Status of the route, which could be Active, Inactive, Adv, or NoAdv.
Age	Time that the route has been in the routing table, in the sequence of hour, minute, and second from left to right.
Tag	Route tag

display ip routing-table acl

Syntax **display ip routing-table acl** *acl-number* [**verbose**]

View Any view

Parameters *acl-number*: Basic ACL number, in the range of 2000 to 2999.

verbose: Displays detailed routing table information, including that for inactive routes. With this argument absent, the command displays only brief information about active routes.

Description

Use the **display ip routing-table acl** command to display information about routes permitted by a specified basic ACL.

This command is intended for the follow-up display of routing policies.

For more information about routing policy, refer to "Routing Policy Common Configuration Commands" on page 1187.

If the specified ACL does not exist or it has no rules configured, the entire routing table is displayed.

Examples

Define basic ACL 2000 and set the route filtering rules.

```
<Sysname > system-view
[Sysname] acl number 2000
[Sysname-acl-basic-2000] rule permit source 10.1.0.0 0.0.255.255
[Sysname-acl-basic-2000] rule deny source any
```

Display brief information about active routes permitted by basic ACL 2000.

```
[Sysname-acl-basic-2000] display ip routing-table acl 2000
Routes Matched by Access list : 2000
Summary Count : 6

Destination/Mask    Proto  Pre  Cost         NextHop         Interface

10.1.1.0/24         Direct 0    0            10.1.1.2        Vlan1
10.1.1.2/32         Direct 0    0            127.0.0.1       InLoop0
10.1.2.0/24         Direct 0    0            10.1.2.1        Eth1/0
10.1.2.1/32         Direct 0    0            127.0.0.1       InLoop0
10.1.3.0/24         Direct 0    0            10.1.3.1        Eth1/1
10.1.3.1/32         Direct 0    0            127.0.0.1       InLoop0
```

For detailed description of the above output, see Table 202.

Display detailed information about both active and inactive routes permitted by basic ACL 2000.

```
<Sysname> display ip routing-table acl 2000 verbose
Routes Matched by Access list : 2000
Summary Count: 6

```

Table 204 Description on the fields of the display ip routing-table command

Field	Description
Destination	Destination address
Mask	Mask
Protocol	Routing protocol that discovered the route
Preference	Preference of the route
Nexthop	Nexthop address
Interface	Outbound interface for packets to be forwarded along the route

Table 204 Description on the fields of the display ip routing-table command

Field	Description	
State	Route status:	
	ActiveU	This is an active unicast route. **U** means unicast.
	Blackhole	A blackhole route is similar with a reject route except that a router drops packets matching a blackhole route without sending ICMP unreachable messages to the source of the packets.
	Delete	This route is deleted.
	Gateway	This is an indirect route.
	Hidden	This route is hidden. For routes that are temporarily unusable for some reasons (because of a policy configured or because the interface is down), you can hide them for later use.
	Holddown	The route is suppressed. Holddown is a route advertisement policy used in some distance vector (D-V) routing protocols, such as RIP, to avoid the propagation of some incorrect routes and improve the transmission speed of unreachable route information. It distributes a certain route during a period regardless of whether a new route to the same destination is found. For details, refer to "IS-IS Configuration Commands" on page 1037 and "Multicast Routing and Forwarding Configuration Commands" on page 1327.
	Int	The route was discovered by an Internal Gateway Protocol (IGP).
	NoAdvise	The route is not advertised when the router advertises routes based on policies.
	NotInstall	Normally, the routes with the highest preference in the routing table are installed into the core routing table and are advertised, while the NotInstall routes cannot be installed into the core routing table but can be advertised.
	Reject	The packets matching a Reject route will be dropped. Besides, the router sends ICMP unreachable messages to the source of the dropped packets. The Reject routes are usually used for network testing.
	Retain	The Retain routes are not deleted when the routes read from the core routing table are deleted. You can keep static routes in the core routing table by configuring them as Retain routes.
	Static	A Static route are not lost when you perform the save operation and then restart the router. Routes configured manually are marked as **static**.
	Unicast	Unicast routes
Age	Age of the route in the routing table, in the form of hh:mm:ss.	
Cost	Route cost	

display ip routing-table ip-address

Syntax **display ip routing-table** *ip-address* [*mask-length* | *mask*] [**longer-match**] [**verbose**]

display ip routing-table *ip-address1* { *mask-length* | *mask* } *ip-address2* { *mask-length* | *mask* } [**verbose**]

View Any view

Parameters *ip-address*: Destination IP address, in dotted decimal format.

mask-length: IP address mask length in the range 0 to 32.

mask: IP address mask in dotted decimal format.

longer-match: Displays the route with the longest prefix.

verbose: Displays detailed routing table information, including both active and inactive routes. With this keyword absent, the command displays only brief information about active routes.

Description Use the **display ip routing-table** *ip-address* command to display information about routes to a specified destination address.

Executing the command with different parameters yields different output:

- **display ip routing-table** *ip-address*

The system ANDs the input destination IP address with the subnet mask in each route entry; and ANDs the destination IP address in each route entry with its corresponding subnet mask.

If the two operations yield the same result for an entry and this entry is active, it is displayed.

- **display ip routing-table** *ip-address mask*

The system ANDs the input destination IP address with the input subnet mask; and ANDs the destination IP address in each route entry with the input subnet mask.

If the two operations yield the same result for an entry and the entry is active with a subnet mask less than or equal to the input subnet mask, the entry is displayed.

Only route entries that exactly match the input destination address and mask are displayed.

- **display ip routing-table** *ip-address* **longer-match**

The system ANDs the input destination IP address with the subnet mask in each route entry; and ANDs the destination IP address in each route entry with its corresponding subnet mask.

If the two operations yield the same result for multiple entries that are active, the one with longest mask length is displayed.

- **display ip routing-table** *ip-address mask* **longer-match**

The system ANDs the input destination IP address with the input subnet mask; and ANDs the destination IP address in each route entry with the input subnet mask.

If the two operations yield the same result for multiple entries with a mask less than or equal to the input subnet mask, the one that is active with longest mask length is displayed.

Use the **display ip routing-table** *ip-address1* { *mask-length* | *mask* } *ip-address2* { *mask-length* | *mask* } command to display route entries with destination addresses within a specified range.

Examples # Display route entries for the destination IP address 11.1.1.1.

```
[Sysname] display ip routing-table  11.1.1.1
Routing Table : Public
Summary Count : 4

Destination/Mask    Proto   Pre  Cost         NextHop         Interface

0.0.0.0/0           Static 60   0            0.0.0.0         NULL0
11.0.0.0/8          Static 60   0            0.0.0.0         NULL0
11.1.0.0/16         Static 60   0            0.0.0.0         NULL0
11.1.1.0/24         Static 60   0            0.0.0.0         NULL0
```

For detailed description about the output, see Table 204.

Display route entries by specifying a destination IP address and the **longer-match** keyword.

```
[Sysname] display ip routing-table  11.1.1.1 longer-match
Routing Table : Public
Summary Count : 1

Destination/Mask    Proto   Pre  Cost         NextHop         Interface

11.1.1.0/24         Static 60   0            0.0.0.0         NULL0
```

Display route entries by specifying a destination IP address and mask.

```
[Sysname] display ip routing-table  11.1.1.1 24
Routing Table : Public
Summary Count : 3

Destination/Mask    Proto   Pre  Cost         NextHop         Interface

11.0.0.0/8          Static 60   0            0.0.0.0         NULL0
11.1.0.0/16         Static 60   0            0.0.0.0         NULL0
11.1.1.0/24         Static 60   0            0.0.0.0         NULL0
```

Display route entries by specifying a destination IP address and mask and the **longer-match** keyword.

```
[Sysname] display ip routing-table  11.1.1.1 24 longer-match
Routing Table : Public
Summary Count : 1

Destination/Mask    Proto   Pre  Cost         NextHop         Interface

11.1.1.0/24         Static 60   0            0.0.0.0         NULL0
```

For detailed description of the above output, see Table 204.

Display route entries for destination addresses in the range 1.1.1.0 to 5.5.5.0.

```
<Sysname> display ip routing-table 1.1.1.0 24 5.5.5.0 24
Routing Table : Public

Destination/Mask    Proto   Pre  Cost         NextHop       Interface
```

```
1.1.1.0/24          Direct 0    0           1.1.1.1       Vlan1
1.1.1.1/32          Direct 0    0           127.0.0.1     InLoop0
2.2.2.0/24          Direct 0    0           2.2.2.1       Vlan2
3.3.3.0/24          Direct 0    0           3.3.3.1       Eth1/0
3.3.3.1/32          Direct 0    0           127.0.0.1     InLoop0
4.4.4.0/24          Direct 0    0           4.4.4.1       Eth1/1
4.4.4.1/32          Direct 0    0           127.0.0.1     InLoop0
```

display ip routing-table ip-prefix

Syntax **display ip routing-table ip-prefix** *ip-prefix-name* [**verbose**]

View Any view

Parameters *ip-prefix-name*: IP Prefix list name, a string of 1 to 19 characters.

verbose: Displays detailed routing table information, including that for inactive routes. With this argument absent, the command displays only brief information about active routes.

Description Use the **display ip routing-table ip-prefix** command to display information about routes permitted by a specified prefix list.

This command is intended for the follow-up display of routing policies. If the specified prefix list is not configured, detailed information about all routes (with the **verbose** keyword) or brief information about all active routes (without the **verbose** keyword) is displayed.

Examples # Configure a prefix list named **test**, permitting routes with a prefix of 2.2.2.0 and a mask length between 24 and 32.

```
<Sysname> system-view
[Sysname] ip ip-prefix test permit 2.2.2.0 24 less-equal 32
```

Display brief information about active routes permitted by the prefix list **test**.

```
[Sysname] display ip routing-table ip-prefix test
Routes Matched by Prefix list : test
Summary Count : 2
Destination/Mask   Proto  Pre  Cost        NextHop         Interface
2.2.2.0/24         Direct  0    0          2.2.2.1         Vlan2
2.2.2.1/32         Direct  0    0          127.0.0.1       InLoop0
```

For detailed description of the above output, see Table 204.

Display detailed information about both active and inactive routes permitted by IP prefix list **test**.

```
[Sysname] display ip routing-table ip-prefix test verbose
Routes Matched by Prefix list  test :
Summary Count : 2

Destination: 2.2.2.0/24
```

```
     Protocol: Direct                  Process ID: 0
   Preference: 0                             Cost: 0
      NextHop: 2.2.2.1                Interface: Vlan2
  RelyNextHop: 0.0.0.0                Neighbour: 0.0.0.0
    Tunnel ID: 0x0                        Label: NULL
        State: Active Adv                   Age: 00h20m52s
          Tag: 0

Destination: 2.2.2.1/32
     Protocol: Direct                  Process ID: 0
   Preference: 0                             Cost: 0
      NextHop: 127.0.0.1              Interface: InLoop0
  RelyNextHop: 0.0.0.0                Neighbour: 0.0.0.0
    Tunnel ID: 0x0                        Label: NULL
        State: Active NoAdv                 Age: 00h20m52s
          Tag: 0
```

For detailed description of the above output, see Table 204.

display ip routing-table protocol

Syntax **display ip routing-table protocol** *protocol* [**inactive** | **verbose**]

View Any view

Parameters *protocol*: Displays the routes of a routing protocol, not including routes redistributed into the protocol. It can be **bgp**, **direct**, **isis**, **ospf**, **rip**, or **static**.

inactive: Displays only inactive routes. With this argument absent, the command displays information about both active and inactive routes.

verbose: Displays detailed routing information. With this argument absent, the command displays brief routing information.

Description Use the **display ip routing-table protocol** command to display routing information of a specified routing protocol.

Examples # Display brief information about direct routes.

```
<Sysname> display ip routing-table protocol direct
Public Routing Table : Direct
Summary Count : 6

Direct Routing table Status : < Active>
Summary Count :  6

Destination/Mask    Proto  Pre  Cost       NextHop         Interface

2.2.2.0/24          Direct 0    0          2.2.2.1         Vlan2
2.2.2.2/32          Direct 0    0          127.0.0.1       InLoop0
127.0.0.0/8         Direct 0    0          127.0.0.1       InLoop0
127.0.0.1/32          Direct 0    0          127.0.0.1       InLoop0
192.168.80.0/24     Direct 0    0          192.168.80.10   Eth1/0
192.168.80.10/32    Direct 0    0          127.0.0.1       InLoop0
```

```
Direct Routing table Status : < Inactive>
Summary Count : 0
```

Display summary information about static routes.

```
<Sysname> display ip routing-table protocol static
Public Routing Table : Static
Summary Count : 2

Static Routing table Status : < Active>
Summary Count :  0

Static Routing table Status : < Inactive>
Summary Count : 2
Destination/Mask    Proto   Pre  Cost       NextHop      Interface
1.2.3.0/24          Static  60   0          1.2.4.5      Vlan10
3.0.0.0/8           Static  60   0           2.2.2.2     Eth1/0
```

For detailed description of the above output, see Table 204.

display ip routing-table statistics

Syntax **display ip routing-table** [**vpn-instance** *vpn-instance-name*] **statistics**

View Any view

Parameters **vpn-instance** *vpn-instance-name*: Displays routing table information for a VPN instance. The VPN instance name is a string of 1 to 31 characters.

Description Use the **display ip routing-table statistics** command to display statistics about the public network routing table or a VPN routing table.

Examples # Display statistics about the routes in the routing table.

```
<Sysname> display ip routing-table statistics
Proto      route       active      added       deleted       freed
DIRECT     24          4           25          1             0
STATIC     4           1           4           0             0
RIP        0           0           0           0             0
OSPF       0           0           0           0             0
IS-IS      0           0           0           0             0
BGP        0           0           0           0             0
Total      28          5           29          1             0
```

Table 205 Description on the fields of the display ip routing-table statistics command

Field	Description
Proto	Origin of the routes. Possible values include O_ASE for OSPF_ASE routes, O_NSSA for OSPF NSSA, and AGGRE for aggregated routes.
route	Number of routes from the origin
active	Number of active routes from the origin
added	Number of routes added into the routing table since the router starts up or the last routing table reset operation

Table 205 Description on the fields of the display ip routing-table statistics command

Field	Description
deleted	Number of routes marked as deleted, which will be freed after a period.
freed	Number of routes that got freed, that is, got removed permanently
Total	Sums for the numerical items above

display ip relay-route

Syntax **display ip relay-route** [**vpn-instance** *vpn-instance-name*]

View Any view

Parameters **vpn-instance** *vpn-instance-name*: Displays the recursive route information of the VPN instance. *vpn-instance-name* is a string of 1 to 31 characters.

Description Use the **display ip relay-route** command to display the information of recursive routes.

When executed with no argument, this command displays the recursive route information of the public network routing table.

Examples # Display recursive route information.

```
<Sysname> display ip relay-route
 Total Number of Relay-route is: 1.
 Dest/Mask: 40.40.40.0/255.255.255.0
        Related instance id(s): 1(1) 2(1) 3(1) 4(1)
```

Table 206 Description on the fields of the display ip relay-route command

Field	Description
Total Number of Relay-route	Total number of recursive routes
Dest/Mask	Destination address/mask of the recursive route
Related instance id(s)	The number in the parentheses after each instance ID indicates the number of routes that have used the recursive route in the routing table corresponding to the instance ID.

display ip relay-tunnel

Syntax **display ip relay-tunnel**

View Any view

Parameters None

Description Use the **display ip relay-tunnel** command to display recursive tunnel information.

Examples # Display recursive tunnel information.

```
<Sysname> display ip relay-tunnel
 Total Number of Relay-tunnel is: 1.
 Dest/Mask: 40.40.40.40/255.255.255.255
       Related instance id(s): 1(1) 2(1) 3(1) 4(1)
```

Table 207 Description on the fields of the display ip relay-tunnel command

Field	Description
Total Number of Relay-tunnel	Total number of recursive tunnels
Dest/Mask	Destination address/mask of the recursive tunnel
Related instance id(s)	The number in the parentheses after each instance ID indicates the number of routes that have used the recursive tunnel in the routing table corresponding to the instance ID.

display load-sharing ip address

Syntax **display load-sharing ip address** *ip-address { mask | mask-length }*

View Any view

Parameters *ip-address*: Destination IP address, in dotted decimal notation.

mask: IP address mask, in dotted decimal notation.

mask-length:IP address mask length, in the range 0 to 32.

Description Use the **display load-sharing ip address** command to display statistics about interface bandwidth-based non-balanced load sharing.

Examples # Display the statistics about bandwidth-based load sharing.

```
<Sysname> display load-sharing ip address 10.2.1.0 24
There are/is totally 3 route entry(s) to the same destination network.
Nexthop     Packet(s)   Bandwidth[KB]   Flow(s)     Interface
10.1.1.2        763851      100000          0           Ethernet0/0/0
10.1.2.2        1193501     155000          0           Atm1/0/0
10.1.3.2        15914       2048                0           Serial2/0/0
```

Table 208 Description on the fields of the display load-sharing ip address command

Field	Description
Nexthop	Nexthop address
Packet	Total number of packets forwarded through the outbound interface
Bandwidth	Bandwidth of the outbound interface used for load sharing
Flow	Number of flows fast forwarded through the outbound interface
Interface	Name of the outbound interface

display ipv6 routing-table

Syntax **display ipv6 routing-table**

View Any view

Parameters None

Description Use the **display ipv6 routing-table** command to display brief routing table information, including destination IP address and prefix, protocol type, priority, metric, next hop and outbound interface.

The command displays only active routes, namely, the brief information about the current optimal routes.

Examples # Display brief routing table information

```
<Sysname> display ipv6 routing-table
Routing Table :
        Destinations : 1        Routes : 1

Destination : ::1/128                           Protocol    : Direct
NextHop     : ::1                               Preference  : 0
Interface   : InLoop0                           Cost        : 0
```

Table 209 Description on the fields of the display ipv6 routing-table command

Field	Description
Destination	Destination IPv6 address
NextHop	Next hop
Preference	Routing preference
Interface	Outbound interface
Protocol	Routing protocol of the route
Cost	Routing cost

display ipv6 routing-table acl

Syntax **display ipv6 routing-table acl** *acl6-number* [**verbose**]

View Any view

Parameters *acl6-number:* Basic IPv6 ACL number, in the range 2000 to 2999.

Verbose: Displays both active and inactive verbose routing information permitted by the ACL. Without this keyword, only brief active routing information is displayed.

Description Use the **display ipv6 routing-table acl** command to display routing information permitted by the IPv6 ACL.

If the specified IPv6 ACL is not available, all routing information is displayed.

Examples # Display brief routing information permitted by ACL 2000.

```
<Sysname> display ipv6 routing-table acl 2000
Routes Matched by Access list  2000  :
```

```
Summary Count : 2

Destination : ::1/128                          Protocol   : Direct
NextHop     : ::1                              Preference : 0
Interface   : InLoop0                          Cost       : 0
Destination : 1:1::/64                           Protocol   : Static
NextHop     : ::                               Preference : 60
Interface   : NULL0                            Cost       : 0
```

Refer to Table 209 for description about the above output.

display ipv6 routing-table ipv6-address

Syntax **display ipv6 routing-table** *ipv6-address prefix-length* [**longer-match**] [**verbose**]

View Any view

Parameters *ipv6-address*: Destination IPv6 address.

prefix-length: Prefix length, in the range 0 to 128.

longer-match: Displays the matched route having the longest prefix length.

verbose: Displays both active and inactive verbose routing information. Without this keyword, only brief active routing information is displayed.

Description Use the **display ipv6 routing-table** *ipv6-address* command to display routing information about the specified destination IPv6 address.

Executing the command with different parameters yields different output:

- **display ipv6 routing-table** *ipv6-address prefix-length*

The system ANDs the input destination IPv6 address with the input prefix length, and ANDs the destination IPv6 address in each route entry with the input prefix length.

If the two operations yield the same result for an entry and the entry is active with a prefix length less than or equal to the input prefix length, the entry is displayed.

Only route entries that exactly match the input destination address and prefix length are displayed.

- **display ipv6 routing-table** *ipv6-address prefix-length* **longer-match**

The system ANDs the input destination IPv6 address with the input prefix length, and ANDs the destination IPv6 address in each route entry with the input prefix length.

If the two operations yield the same result for multiple entries with a prefix length less than or equal to the input prefix length, the one that is active with the longest prefix length is displayed.

Examples # Display brief routing information for the specified destination IPv6 address and prefix.

```
<Sysname> display ipv6 routing-table 10::1 127
Routing Table:
Summary Count: 3
Destination: 10::/64                                    Protocol  : Static
NextHop    : ::                                         Preference: 60
Interface  : NULL0                                      Cost      : 0
Destination: 10::/68                                    Protocol  : Static
NextHop    : ::                                         Preference: 60
Interface  : NULL0                                      Cost      : 0
Destination: 10::/120                                    Protocol  : Static
NextHop    : ::                                          Preference: 60
Interface  : NULL0                                       Cost      : 0
```

Display brief information about the matched route with the longest prefix length.

```
<Sysname> display ipv6 routing-table 10:: 127 longer-match
Routing Tables:
Summary Count : 1
Destination: 10::/120                                    Protocol  : Static
NextHop    : ::                                          Preference: 60
Interface  : NULL0                                       Cost      : 0
```

Refer to Table 209 for description about the above output.

display ipv6 routing-table ipv6-address1 ipv6-address2

Syntax **display ipv6 routing-table** *ipv6-address1 prefix-length1 ipv6-address2 prefix-length2* [**verbose**]

View Any view

Parameters *ipv6-address1*/*ipv6-address2*: An IPv6 address range from IPv6 address1 to IPv6 address2.

prefix-length1/*prefix-length2*: Prefix length, in the range 0 to 128.

verbose: Displays both active and inactive verbose routing information. Without this keyword, only brief active routing information is displayed.

Description Use the **display ipv6 routing-table** *ipv6-address1 ipv6-address2* command to display routes with destinations falling into the specified IPv6 address range.

Examples # Display routes with destinations falling into the IPv6 address range.

```
<Sysname> display ipv6 routing-table 3:: 32 4:4:: 64
Routing Table :
Summary Count : 3

Destination: 100::/64                                    Protocol  : Static
NextHop    : ::                                          Preference: 60
Interface  : NULL0                                       Cost      : 0

Destination: 200::/64                                    Protocol  : Static
NextHop    : ::                                          Preference: 60
```

```
Interface  : NULL0                                      Cost      : 0

Destination: 300::/64                                   Protocol  : Static
NextHop    : ::                                         Preference: 60
Interface  : NULL0                                      Cost      : 0
```

Refer to Table 209 for description about the above output.

display ipv6 routing-table ipv6-prefix

Syntax **display ipv6 routing-table ipv6-prefix** *ipv6-prefix-name* [**verbose**]

View Any view

Parameters *ipv6-prefix-name*: Name of the IPv6 prefix list, in the range 1 to 19 characters.

verbose: Displays both active and inactive verbose routing information. Without this keyword, only brief active routing information is displayed.

Description Use the **display ipv6 routing-table ipv6-prefix** command to display routes permitted by the IPv6 prefix list.

Examples # Display brief active routing information permitted by the IPv6 prefix list **abc2**.

```
<Sysname> display ipv6 routing-table ipv6-prefix abc2
Routes Matched by Prefix list  abc  :
Summary Count : 1
Destination: 100::/64                                   Protocol  : Static
NextHop    : ::                                         Preference: 60
Interface  : NULL0                                      Cost      : 0
```

Refer to Table 209 for description about the above output.

display ipv6 routing-table protocol

Syntax **display ipv6 routing-table protocol** *protocol* [**inactive** | **verbose**]

View Any view

Parameters *protocol*: Displays the routes of a routing protocol, not including routes redistributed into the protocol. The protocol can be **bgp4+**, **direct**, **isisv6**, **ospfv3**, **ripng** or **static**.

inactive: Displays only inactive routes. Without the keyword, all active and inactive routes are displayed.

verbose: Displays both active and inactive verbose routing information. Without this keyword, only brief active routing information is displayed.

Description Use the **display ipv6 routing-table protocol** command to display routes of a specified routing protocol.

Examples # Display brief information about all direct routes.

```
<Sysname> display ipv6 routing-table protocol direct
Direct Routing Table :
Summary Count : 1

Direct Routing Table's Status : < Active >
Summary Count : 1

Destination: ::1/128                                    Protocol  : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost      : 0

Direct Routing Table's Status : < Inactive >
Summary Count : 0
```

Refer to Table 209 for description about the above output.

display ipv6 routing-table statistics

Syntax **display ipv6 routing-table statistics**

View Any view

Parameters None

Description Use the **display ipv6 routing-table statistics** command to display routing statistics, including total route number, added route number and deleted route number.

Examples # Display routing statistics.

```
<Sysname> display ipv6 routing-table statistics
Protocol   route      active     added      deleted     freed
DIRECT      1           1          1           0           0
STATIC      3           0          3           0           0
RIPng       0           0          0           0           0
OSPFv3      0           0          0           0           0
IS-ISv6     0           0          0           0           0
BGP4+       0           0          0           0           0
Total       4           1          4           0           0
```

Table 210 Description on the fields of the display ipv6 routing-table statistics command

Field	Description
Protocol	Routing protocol
route	Route number of the protocol
active	Active route number
added	Routes added after the last startup of the router
deleted	Deleted routes, which will be released after a specified time
freed	Released (totally removed from the routing table) route number
Total	Total route number

display ipv6 routing-table verbose

Syntax **display ipv6 routing-table verbose**

View Any view

Parameters None

Description Use the **display ipv6 routing-table verbose** command to display detailed information about all active and inactive routes, including the statistics of the entire routing table and information for each route.

Examples # Display detailed information about all active and inactive routes.

```
<Sysname> display ipv6 routing-table verbose
Routing Table :
         Destinations : 1        Routes : 1

 Destination  : ::1                                    PrefixLength : 128
 NextHop      : ::1                                    Preference   : 0
 RelayNextHop : ::                                     Tag          : 0H
 Neighbour    : ::                                     ProcessID    : 0
 Interface    : InLoopBack0                            Protocol     : Direct
 State        : Active NoAdv                           Cost         : 0
 Tunnel ID    : 0x0                                    Label        : NULL
 Age          : 22161sec
```

Table 211 Description on the fields of the display ipv6 routing-table verbose command

Field	Description
Destination	Destination IPv6 address
PrefixLength	Prefix length of the address
Nexthop	Next hop
Preference	Routing preference
RelayNextHop	Relay next hop
Tag	Tag of the route
Neighbour	Neighbor address
ProcessID	Process ID
Interface	Outbound interface
Protocol	Routing protocol
State	State of the route, Active, Inactive, Adv (advertised), or NoAdv (not advertised)
Cost	Cost of the route
Tunnel ID	Tunnel ID
Label	Label
Age	Time that has elapsed since the route was generated

display ipv6 relay-route

Syntax **display ipv6 relay-route**

View Any view

Parameters None

Description Use the **display ipv6 relay-route** command to display IPv6 recursive route information.

Examples # Display IPv6 recursive route information.

```
<Sysname> display ipv6 relay-route
 Total Number of relay-route is: 1
 Dest/Mask: 192::1/64
      Related instance id(always 0): 0(1)
```

Table 212 Description on the fields of the display ipv6 relay-route command

Field	Description
Total Number of Relay-route	Total number of recursive routes
Dest/Mask	Destination address/mask of the recursive route
Related instance id(always 0)	IPv6 supports public networks only. Therefore, the instance ID can be 0 only. The number in the parentheses after the instance ID indicates the number of routes that have used the recursive route in the routing table.

display ipv6 relay-tunnel

Syntax **display ipv6 relay-tunnel**

View Any view

Parameters None

Description Use the **display ipv6 relay-tunnel** command to display IPv6 recursive tunnel information.

Examples # Display IPv6 recursive tunnel information.

```
<Sysname> display ipv6 relay-tunnel
 Total Number of relay-tunnel is: 1.
 Dest/Mask: 192::0/64
      Related instance id(always 0): 0(1)
```

Table 213 Description on the fields of the display ipv6 relay-tunnel command

Field	Description
Total Number of Relay-tunnel	Total number of recursive tunnels
Dest/Mask	Destination address/mask of the recursive tunnel
Related instance id(always 0)	IPv6 supports public networks only. Therefore, the instance ID can be 0 only. The number in the parentheses after the instance ID indicates the number of routes that have used the recursive tunnel in the routing table.

load-bandwidth

Syntax **load-bandwidth** *bandwidth*

undo load-bandwidth

View Interface view

Parameters *bandwidth*: Specifies the load sharing bandwidth for the interface.

Description Use the **load-bandwidth** *bandwidth* command to specify the load sharing bandwidth of the interface.

Use the **undo load-bandwidth** command to restore the default.

The load sharing bandwidth of an interface defaults to the physical bandwidth of the interface.

Examples # Configure the load sharing bandwidth of the interface.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] load-bandwidth 100
```

reset load-sharing

Syntax **reset load-sharing statistics ip address** *ip-address { mask | mask-length }*

reset load-sharing statistics all

View User view

Parameters *ip-address*: Destination IP address, in dotted decimal notation.

mask: IP address mask, in dotted decimal notation.

mask-length:IP address mask length, in the range 0 to 32.

Description Use the **reset load-sharing ip address** command to clear the statistics of non-balanced load sharing. This command clears the load sharing statistics of all the outbound interfaces corresponding to the destination IP address.

Use the **reset load-sharing all** command to clear the load sharing statistics of the outbound interfaces of all the forwarding entries.

Examples # Display the statistics of bandwidth-based load sharing.

```
<Sysname> display load-sharing ip address 10.2.1.0 24
There are/is totally 3 route entry(s) to the same destination network.
Nexthop     Packet(s)   Bandwidth[KB]   Flow(s)     Interface
10.1.1.2        763851      100000          0           Ethernet0/0/0
```

```
10.1.2.2        1193501     155000          0           Atm1/0/0
10.1.3.2        15914       2048                0           Serial2/0/0
```

Clear the statistics of bandwidth-based load sharing.

```
<Sysname> reset load-sharing statistics ip address 10.2.1.0 24
There are/is totally 3 route entry(s) to the same destination network.
Nexthop     Packet(s)   Bandwidth[KB]   Flow(s)     Interface
10.1.1.2        0           100000          0           Ethernet0/0/0
10.1.2.2        0           155000          0           Atm1/0/0
10.1.3.2        0           2048                0           Serial2/0/0
```

reset ip routing-table statistics protocol

Syntax **reset ip routing-table statistics protocol** [**vpn-instance** *vpn-instance-name*] { **all** | *protocol* }

View User view

Parameters *vpn-instance-name*: VPN instance name, a string of 1 to 31 characters.

all: Clears the routing statistics of all the routing protocols in the IPv4 routing table.

protocol: Clears the routing statistics of the specified routing protocol in the IPv6 routing table. At present, this argument can be **bgp**, **direct**, **is-is**, **ospf**, **rip**, or **static**.

Description Use the **reset ip routing-table statistics protocol** command to clear routing statistics for the routing table or VPN routing table.

Examples # Clear the routing statistics for the VPN instance **Sysname1**.

```
<Sysname> reset ip routing-table statistics protocol vpn-instance Sy
sname1 all
```

reset ipv6 routing-table statistics

Syntax **reset ipv6 routing-table statistics protocol** { **all** | *protocol* }

View User view

Parameters **all**: Clears the routing statistics of all the routing protocols in the IPv6 routing table.

protocol: Clears the routing statistics of the specified routing protocol in the IPv6 routing table. At present, this argument can be **bgp4+**, **direct**, **isisv6**, **ospfv3**, **ripng**, or **static**.

Description Use the **reset ipv6 routing-table statistics** command to clear IPv6 routing table statistics.

Examples # Clear the routing statistics of all the routing protocols in the routing table.

```
<Sysname> reset ipv6 routing-table statistics protocol all
```

72 BGP CONFIGURATION COMMANDS

For routing policy configuration commands, refer to "Routing Policy Common Configuration Commands" on page 1187.

aggregate

Syntax **aggregate** *ip-address* { *mask* | *mask-length* } [**as-set** | **attribute-policy** *route-policy-name* | **detail-suppressed** | **origin-policy** *route-policy-name* | **suppress-policy** *route-policy-name*] *

undo aggregate *ip-address* { *mask* | *mask-length* }

View BGP view/BGP-VPN instance view

Parameters *ip-address*: Destination IP address of summary route.

mask: Summary route mask, in dotted decimal notation.

mask-length: Length of summary route mask, in the range 0 to 32.

as-set: Creates a summary with AS set.

attribute-policy *route-policy-name:* Sets the attributes of the summary route according to the routing policy, the name of which is a string of 1 to 19 characters.

detail-suppressed: Only advertises the summary route.

suppress-policy *route-policy-name*: Suppresses specific routes defined in the routing policy, the name of which is a string of 1 to 19 characters.

origin-policy *route-policy-name*: References the routing policy to specify routes for summarization. The policy name is a string of 1 to 19 characters.

The keywords of the command are described as follows:

Table 214 Functions of the keywords

Keywords	Function
as-set	Used to create a summary route, whose AS path contains the AS path information of summarized routes. Use this keyword carefully when many AS paths need to be summarized, because the frequent changes of routes may lead to route oscillation.

Table 214 Functions of the keywords

Keywords	Function
detail-suppressed	This keyword does not suppress the summary route, but it suppresses the advertisement of all the more specific routes. To summarize only some specific routes, use the **peer filter-policy** command.
suppress-policy	Used to create a summary route and suppress the advertisement of some summarized routes. If you want to suppress some routes selectively and leave other routes still advertised, use the **if-match** clause of the **route-policy** command.
origin-policy	Selects only routes satisfying the routing policy for route summarization
attribute-policy	Sets attributes except the AS-PATH attribute for the summary route. The same work can be done by using the **peer route-policy** command.

Description Use the **aggregate** command to create a summary route in the BGP routing table.

Use the **undo aggregate** command to remove a summary route.

By default, no summary route is configured.

Examples # In BGP view, create a summary of 192.213.0.0/16 in the BGP routing table.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] aggregate 192.213.0.0 255.255.0.0
```

In BGP-VPN instance view, create a summary of 192.213.0.0/16 in BGP routing table (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] aggregate 192.213.0.0 255.255.0.0
```

balance (BGP/BGP-VPN instance view)

Syntax **balance** *number*

undo balance

View BGP view/VPN instance view

Parameters *number*: Number of BGP routes for load balancing, in the range 1 to 8. When it is set to 1, no load balancing is available.

Description Use the **balance** command to configure the number of BGP routes for load balancing.

Use the **undo balance** command to disable load balancing.

By default, no load balancing is configured.

Unlike IGP, BGP has no explicit metric for making load balancing decision. Instead, it implements load balancing using route selection rules.

Related commands: **display bgp routing-table**.

Examples # In BGP view, set the number of routes participating in BGP load balancing to 2.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] balance 2
```

In BGP-VPN instance view, set the number of routes participating in BGP load balancing to 2 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] balance 2
```

bestroute as-path-neglect (BGP/BGP-VPN instance view)

Syntax **bestroute as-path-neglect**

undo bestroute as-path-neglect

View BGP view/BGP-VPN instance view

Parameters None

Description Use the **bestroute as-path-neglect** command to configure the BGP router to not evaluate the AS_PATH during best route selection.

Use the **undo bestroute as-path-neglect** command to configure the BGP router to take the AS_PATH as a factor during best route selection.

By default, the router takes AS_PATH as a factor when selecting the best route.

Examples # In BGP view, ignore AS_PATH in route selection.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] bestroute as-path-neglect
```

In BGP-VPN instance view, ignore AS_PATH in route selection (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] bestroute as-path-neglect
```

bestroute compare-med (BGP/BGP-VPN instance view)

Syntax **bestroute compare-med**

undo bestroute compare-med

View BGP view/BGP-VPN instance view

Parameters None

Description Use the **bestroute compare-med** command to enable the comparison of the MED for paths from each AS.

Use the **undo bestroute compare-med** command to disable this comparison.

This comparison is not enabled by default.

Examples # In BGP view, enable the comparison of MEDs for paths from each AS when selecting the best route.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] bestroute compare-med
```

In BGP-VPN instance view, enable the comparison of MED for paths from each AS when selecting the best route. (The VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] bestroute compare-med
```

bestroute med-confederation (BGP/BGP-VPN instance view)

Syntax **bestroute med-confederation**

undo bestroute med-confederation

View BGP view/BGP-VPN instance view

Parameters None

Description Use the **bestroute med-confederation** command to enable the comparison of the MED for paths from confederation peers to select the optimal route.

Use the **undo bestroute med-confederation** command to disable the comparison.

The comparison is not enabled by default.

The system only compares MED values for paths from peers within the confederation. Paths from external ASs are advertised throughout the confederation without MED comparison.

Examples # In BGP view, enable the comparison of the MED for paths from peers within the confederation.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] bestroute med-confederation
```

In BGP-VPN instance view, enable the comparison of the MED for paths from peers within the confederation. (The VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] bestroute med-confederation
```

bgp

Syntax **bgp** *as-number*

undo bgp [*as-number*]

View System view

Parameters *as-number*: Specifies the local AS number from 1 to 65535.

Description Use the **bgp** command to enable BGP and enter the BGP view.

Use the **undo bgp** command to disable BGP.

By default, BGP is not enabled.

Examples # Enable BGP and set local AS number to 100.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp]
```

compare-different-as-med (BGP/BGP-VPN instance view)

Syntax **compare-different-as-med**

undo compare-different-as-med

View BGP view/BGP-VPN instance view

Parameters None

Description Use the **compare-different-as-med** command to enable the comparison of the MED for paths from peers in different ASs.

Use the **undo compare-different-as-med** command to disable the comparison.

The comparison is disabled by default.

If there are several paths for one destination available, the path with the smallest MED is selected.

Do not use this command unless associated ASs adopt the same IGP protocol and routing selection method.

Examples # In BGP view, enable to compare the MED for paths from peers in different ASs.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] compare-different-as-med
```

In BGP-VPN instance view, enable to compare the MED for paths from peers in different ASs (The VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] compare-different-as-med
```

confederation id

Syntax **confederation id** *as-number*

undo confederation id

View BGP view

Parameters *as-number*: Number of the AS that contains multiple sub-ASs, in the range 1 to 65535.

Description Use the **confederation id** command to configure a confederation ID.

Use the **undo confederation id** command to remove a specified confederation.

By default, no confederation ID is configured.

Configuring a confederation can reduce IBGP connections in a large AS. You can split the AS into several sub-ASs, and each sub-AS remains fully meshed. These sub-ASs form a confederation. Key IGP attributes of a route, such as the next hop, MED, local preference, are not discarded when crossing each sub-AS. The sub-ASs still look like a whole from the perspective of other ASs. This can ensure the integrity of the former AS, and solve the problem of too many IBGP connections in the AS.

Related commands: **confederation nonstandard** and **confederation peer-as**.

Examples # Confederation 9 consists of four sub-ASs, namely, 38, 39, 40 and 41. The peer 10.1.1.1 is a member of the confederation while the peer 200.1.1.1 is outside of the confederation. Take sub AS 41 as an example.

```
<Sysname> system-view
[Sysname] bgp 41
[Sysname-bgp] confederation id 9
[Sysname-bgp] confederation peer-as 38 39 40
[Sysname-bgp] group Confed38 external
[Sysname-bgp] peer Confed38 as-number 38
[Sysname-bgp] peer 10.1.1.1 group Confed38
[Sysname-bgp] group Remote98 external
[Sysname-bgp] peer Remote98 as-number 98
[Sysname-bgp] peer 200.1.1.1 group Remote98
```

confederation nonstandard

Syntax **confederation nonstandard**

undo confederation nonstandard

View BGP view

Parameters None

Description Use the **confederation nonstandard** command to make the router compatible with routers not compliant with RFC3065 in the confederation.

Use the **undo confederation nonstandard** command to restore the default.

By default, all routers in the confederation comply with RFC3065.

All devices in the confederation should be configured with this command to interact with those devices not compliant with RFC3065.

Related commands: **confederation id** and **confederation peer-as**.

Examples # AS100 contains routers not compliant with RFC3065 and comprises two sub-ASs, 64000 and 65000.

```
<Sysname> system-view
[Sysname] bgp 64000
[Sysname-bgp] confederation id 100
[Sysname-bgp] confederation peer-as 65000
[Sysname-bgp] confederation nonstandard
```

confederation peer-as

Syntax **confederation peer-as** *as-number-list*

undo confederation peer-as [*as-number-list*]

View BGP view

Parameters *as-number-list*: Sub-AS number list. Up to 32 sub-ASs can be configured in one command line. The expression is *as-number-list* = a*s-number* &<1-32>, in which a*s-number* specifies a sub-AS number, and &<1-32> indicates up to 32 numbers can be specified.

Description Use the **confederation peer-as** command to specify confederation peer sub-ASs.

Use the **undo confederation peer-as** command to remove specified confederation peer sub-ASs.

By default, no confederation peer sub-ASs are configured.

Before this configuration, the **confederation id** command must be used to specify the confederation for the sub-ASs.

If the **undo confederation peer-as** command without the *as-number-list* argument is used, all confederation peer sub-ASs are removed.

Related commands: **confederation nonstandard** and **confederation id**.

Examples # Specify confederation peer sub ASs 2000 and 2001.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] confederation id 10
[Sysname-bgp] confederation peer-as 2000 2001
```

dampening (BGP/BGP-VPN instance view)

Syntax **dampening** [*half-life-reachable half-life-unreachable reuse suppress ceiling* | **route-policy** *route-policy-name*] *

undo dampening

View BGP view/BGP-VPN instance view

Parameters *half-life-reachable*: Specifies a half-life for active routes from 1 to 45 minutes. By default, the value is 15 minutes.

half-life-unreachable: Specifies a half-life for suppressed routes from 1 to 45 minutes. By default, the value is 15 minutes.

reuse: Specifies a reuse threshold value for suppressed routes from 1 to 20000. A suppressed route whose penalty value decreases under the value is reused. By default, the reuse value is 750.

suppress: Specifies a suppression threshold from 1 to 20000. The route with a penalty value higher than the threshold is suppressed. The default value is 2000.

ceiling: Specifies a ceiling penalty value from 1001 to 20000. The value must be bigger than the *suppress* value. By default, the value is 16000.

route-policy-name: Routing policy name, a string of 1 to 19 characters.

*half-life-reachable, half-life-unreachable, reuse, suppres*s and *ceiling* are mutually dependent. Once any one is configured, all the others should also be specified accordingly.

Description Use the **dampening** command to enable BGP route dampening and/or configure dampening parameters.

Use the **undo dampening** command to disable route dampening.

By default, no route dampening is configured.

The command dampens only EBGP routes rather than IBGP routes.

Related commands: **reset bgp dampening**, **reset bgp flap-info**, **display bgp routing-table dampened**, **display bgp routing-table dampening parameter** and **display bgp routing-table flap-info**.

Examples # In BGP view, configure BGP route dampening.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] dampening 15 15 1000 2000 10000
```

In BGP-VPN instance view, configure BGP route dampening (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] dampening 15 15 1000 2000 10000
```

default ipv4-unicast

Syntax **default ipv4-unicast**

undo default ipv4-unicast

View BGP view

Parameters None

Description Use the **default ipv4-unicast** command to enable the use of IPv4 unicast address family for all peers.

Use the **undo default ipv4-unicast** command to disable the use of IPv4 unicast address family for all peers.

The use of IPv4 unicast address family is enabled by default.

Examples # Enable IPv4 unicast address family for all neighbors.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] default ipv4-unicast
```

default local-preference (BGP/BGP-VPN instance view)

Syntax **default local-preference** *value*

undo default local-preference

View BGP view/BGP-VPN instance view

Parameters *value*: Default local preference, in the range 0 to 4294967295. The larger the value is, the higher the preference is.

Description Use the **default local-preference** command to configure the default local preference.

Use the **undo default local-preference** command to restore the default value.

By default, the default local preference is 100.

Using this command can affect BGP route selection.

Examples # In BGP view, set the default local preference to 180.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] default local-preference 180
```

In BGP-VPN instance view, set the default local preference to 180 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] default local-preference 180
```

default med (BGP/BGP-VPN instance view)

Syntax **default med** *med-value*

undo default med

View BGP view/BGP-VPN instance view

Parameters *med-value*: Default MED value, in the range 0 to 4294967295.

Description Use the **default med** command to specify a default MED value.

Use the **undo default med** command to restore the default.

By default, the default *med-value* is 0.

Multi-exit discriminator (MED) is an external metric for routes. Different from local preference, MED is exchanged between ASs and will stay in the AS once it enters the AS. The route with a lower MED is preferred. When a router running BGP obtains several routes with an identical destination but different next-hops from various external peers, it will select the best route depending on the MED value. In the case that all other conditions are the same, the system first selects the route with the smallest MED as the best external route.

Examples # In BGP view, configure the default MED as 25.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] default med 25
```

In BGP-VPN instance view, configure the default MED as 25 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] default med 25
```

default-route imported (BGP/BGP-VPN instance view)

Syntax **default-route imported**

undo default-route imported

View BGP view/BGP-VPN instance view

Parameters None

Description Use the **default-route imported** command to allow default route redistribution into the BGP routing table.

Use the **undo default-route imported** command to disallow the redistribution.

By default, default route redistribution is not allowed.

Using the **default-route imported** command cannot redistribute default routes. To do so, use the **import-route** command.

Related commands: **import-route (BGP/BGP-VPN instance view)**.

Examples # In BGP view, allow default route redistribution from OSPF into BGP.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] default-route imported
[Sysname-bgp] import-route ospf 1
```

In BGP-VPN instance view, enable redistributing default route from OSPF into BGP (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] default-route imported
[Sysname-bgp-vpn1] import-route ospf 1
```

display bgp group

Syntax **display bgp group** [*group-name*]

View Any view

Parameters *group-name*: Peer group name, a string of 1 to 47 characters.

Description Use the **display bgp group** command to display the information of the peer group.

Examples # Display the information of the peer group **aaa**.

```
<Sysname> display bgp group aaa
 BGP peer-group is aaa
 remote AS 200
 Type : external
 Maximum allowed prefix number: 4294967295
 Threshold: 75%
 Configured hold timer value: 180
 Keepalive timer value: 60
 Minimum time between advertisement runs is 30 seconds
 Peer Preferred Value: 0
 No routing policy is configured
  Members:
  Peer            V    AS  MsgRcvd  MsgSent  OutQ PrefRcv Up/Down  State

  2.2.2.1         4   200        0        0     0       0 00:00:35 Active
```

Table 215 Description on the fields of the display bgp group command

Field	Description
BGP peer-group	Name of the BGP peer group
remote AS	AS number of peer group
type	Type of the BGP peer group: IBGP or EBGP
Maximum allowed prefix number	Maximum allowed prefix number
Threshold	Threshold value

Table 215 Description on the fields of the display bgp group command

Field	Description
Configured hold timer value	Holdtime interval
Keepalive timer value	Keepalive interval
Minimum time between advertisement runs	Minimum time between advertisement runs
Peer Preferred Value	Preferred value of the routes from the peer
No routing policy is configured	No routing policy is configured for the peer
Members	Detailed information of the members in the peer group
Peer	IPv4 address of the peer
V	BGP version running on peers
AS	AS number of the peers
MsgRcvd	Number of messages received
MsgSent	Number of messages sent
OutQ	Number of messages to be sent
PrefRcv	Number of prefixes received
Up/Down	The lasting time of a session/the lasting time of present state (when no session is established)
State	State machine of peer

display bgp network

Syntax **display bgp network**

View Any view

Parameters None

Description Use the **display bgp network** command to display routing information advertised with the **network** command.

Examples # Display routing information that has been advertised.

```
<Sysname> display bgp network

  BGP Local Router ID is 10.1.4.2.
  Local AS Number is 400.
  Network          Mask            Route-policy        Short-cut

  100.1.2.0        255.255.255.0
  100.1.1.0        255.255.255.0                       Short-cut
```

Table 216 Description on the fields of the display bgp network command

Field	Description
BGP Local Router ID	BGP Local Router ID
Local AS Number	Local AS Number
Network	Network address

Table 216 Description on the fields of the display bgp network command

Field	Description
Mask	Mask
Route-policy	Routing policy
Short-cut	Short-cut route

display bgp paths

Syntax **display bgp paths** [*as-regular-expression*]

View Any view

Parameters *as-regular-expression*: AS path regular expression.

Description Use the **display bgp paths** command to display information about BGP paths.

Examples # Display information about BGP paths matching the AS path regular expression.

```
<Sysname> display bgp paths ^200

    Address       Hash    Refcount  MED         Path/Origin
    0x5917100     11      1                     200 300i
```

Table 217 Description on the fields of the display bgp paths command

Field	Description	
Address	Route address in local database, in dotted hexadecimal notation	
Hash	Hash index	
Refcount	Count of routes that referenced the path	
MED	MED of the path	
Path	AS_PATH attribute of the path, recording the ASs it has passed, for avoiding routing loops	
Origin	Origin attribute of the route:	
	i	Indicates the route is interior to the AS. Summary routes and routes defined using the **network** command are considered IGP routes.
	e	Indicates that a route is learned from the exterior gateway protocol (EGP).
	?	Short for INCOMPLETE. It indicates that the origin of a route is unknown and the route is learned by other means.

display bgp peer

Syntax **display bgp peer** [*ip-address* { **log-info** | **verbose** } | *group-name* **log-info** | **verbose**]

View Any view

Parameters *ip-address*: IP address of an peer to be displayed, in dotted decimal notation.

group-name: Name of a peer group to be displayed, a string of 1 to 47 characters.

log-info: Displays the log information of the specified peer.

verbose: Displays the detailed information of the peer/peer group.

Description Use the **display bgp peer** command to display peer/peer group information.

Examples # Display the detailed information of the peer 10.110.25.20.

```
<Sysname> display bgp peer 10.110.25.20 verbose

         Peer: 10.110.25.20 Local: 2.2.2.2
         Type: EBGP link
         BGP version 4, remote router ID 1.1.1.1
         BGP current state: Established, Up for 00h01m51s
         BGP current event: RecvKeepalive
         BGP last state: OpenConfirm
         Port:  Local - 1029     Remote - 179
         Configured: Active Hold Time: 180 sec   Keepalive Time: 60 sec
         Received  : Active Hold Time: 180 sec
         Negotiated: Active Hold Time: 180 sec
         Peer optional capabilities:
         Peer support bgp multi-protocol extended
         Peer support bgp route refresh capability
         Address family IPv4 Unicast: advertised and received

 Received: Total 5 messages, Update messages 1
 Sent: Total 4 messages, Update messages 0
 Maximum allowed prefix number: 4294967295
 Threshold: 75%
 Minimum time between advertisement runs is 30 seconds
 Optional capabilities:
 Route refresh capability has been enabled
 Peer Preferred Value: 0

 Routing policy configured:
 No routing policy is configured
```

Table 218 Description on the fields of the display bgp peer command

Field	Description
Peer	IP address of the peer
Local	Local router ID
Type	Peer type: Internal as IBGP peers and External as EBGP peers.
BGP version	BGP protocol version
remote router ID	Router ID of the peer
BGP current state	Current state of the peer
BGP current event	Current event of the peer
BGP last state	Last state of the peer
Port	Port number of local router and its peer
Configured: Active Hold Time	Local holdtime interval
Keepalive Time	Local keepalive interval
Received: Active Hold Time	Remote holdtime interval
Negotiated: Active Hold Time	Negotiated holdtime interval

Table 218 Description on the fields of the display bgp peer command

Field	Description
Peer optional capabilities	Optional capabilities supported by the peer, including BGP multiple extension and routing refresh.
Address family IPv4 Unicast	Routes are advertised and received in the form of IPv4 unicast
Received	Total numbers of received packets and updates
Sent	Total numbers of sent packets and updates
Maximum allowed prefix number	Maximum allowed prefix number
Threshold	Threshold value
Minimum time between advertisement runs	Minimum time between route advertisements
Optional capabilities	Optional capabilities enabled by the peer
Peer Preferred Value	Preferred value specified for the routes from the peer
Routing policy configured	Local routing policy

display bgp routing-table

Syntax **display bgp routing-table** [*ip-address* [{ *mask* | *mask-length* } [**longer-prefixes**]]]

View Any view

Parameters *ip-address*: Destination IP address.

mask: Network mask, in dotted decimal notation.

mask-length: Mask length, in the range 0 to 32.

longer-prefixes: Matches the longest prefix.

Description Use the **display bgp routing-table** command to display specified BGP routing information in the BGP routing table.

Examples # Display BGP routing table information.

```
<Sysname> display bgp routing-table

 Total Number of Routes: 1

 BGP Local router ID is 10.10.10.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

 *>  40.40.40.0/24     20.20.20.1                              0       200 300i
```

Table 219 Description on the fields of the display bgp routing command

Field	Description
Total Number of Routes	Total Number of Routes

Table 219 Description on the fields of the display bgp routing command

Field	Description	
BGP Local router ID	BGP Local router ID	
Status codes	Status codes:	
	* - valid	
	> - best	
	d - damped	
	h - history	
	i - internal (IGP)	
	s - summary suppressed (suppressed)	
	S - Stale	
Origin	i - IGP (originated in the AS)	
	e - EGP (learned through EGP)	
	? - incomplete (learned by other means)	
Network	Destination network address	
Next Hop	Next hop IP address	
MED	MULTI_EXIT_DISC attribute	
LocPrf	Local preference value	
PrefVal	Preferred value of the route	
Path	AS_PATH attribute, recording the ASs the packet has passed to avoid routing loops	
PrefVal	Preferred value	
Ogn	Origin attribute of the route, one of the following values:	
	i	Indicates that the route is interior to the AS. Summary routes and the routes configured using the **network** command are considered IGP routes.
	e	Indicates that the route is learned via the exterior gateway protocol (EGP).
	?	Short for INCOMPLETE. It indicates that the origin of the route is unknown and the route is learned by other means.

display bgp routing-table as-path-acl

Syntax **display bgp routing-table as-path-acl** *as-path-acl-number*

View Any view

Parameters *as-path-acl-number*: Displays routing information permitted by the AS path ACL, which is specifies with a number from 1 to 256.

Description Use the **display bgp routing as-path-acl** command to display BGP routes permitted by an as-path ACL.

Examples # Display BGP routes permitted by AS path ACL 1.

```
<Sysname> display bgp routing-table as-path-acl 1

 BGP Local router ID is 20.20.20.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network            NextHop        MED        LocPrf      PrefVal Path/Ogn

*>  40.40.40.0/24     30.30.30.1     0                     0      300i
<Sysname> display bgp routing-table

 Total Number of Routes: 2
 BGP Local router ID is 2.2.2.2
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network         NextHop        MED      ocPrf      PrefVal Path/Ogn

 *>  9.1.1.0/24     10.1.1.1                            0      65001 100i
 *>  10.1.5.0/24    10.1.1.1                            0      65001
                                                               65004i

<Sysname> display bgp routing-table as-path-acl 1

 BGP Local router ID is 2.2.2.2
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network         NextHop      MED       LocPrf    PrefVal Path/Ogn

 *>  10.1.5.0/24     10.1.1.1                          0       65001
                                                               65004i
```

Refer to Table 219 for description on the fields above.

display bgp routing-table cidr

Syntax **display bgp routing-table cidr**

View Any view

Parameters None

Description Use the **display bgp routing-table cidr** command to display BGP CIDR (Classless Inter-Domain Routing) routing information.

Examples # Display BGP CIDR routing information.

```
<Sysname> display bgp routing-table cidr

 BGP Local router ID is 20.20.20.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network          NextHop         MED        LocPrf     PrefVal Path/Ogn

*>  40.40.40.0/24    30.30.30.1      0                     0       300i
```

Refer to Table 219 for description on the above fields.

display bgp routing-table community

Syntax **display bgp routing-table community** [*aa:nn*&<1-13>] [**no-advertise** | **no-export** | **no-export-subconfed**] * [**whole-match**]

View Any view

Parameters *aa:nn*: Community number. Both aa and nn are in the range 0 to 65535.

&<1-13>: Argument before it can be entered up to 13 times.

no-advertise: Displays BGP routes that are not advertised to any peer.

no-export: Displays routes that are not advertised outside the AS. With a confederation configured, it displays routes that are not advertised outside the confederation, but can be advertised to other sub ASs in the confederation.

no-export-subconfed: Displays routes that are neither advertised outside the AS nor to other sub ASs in a configured confederation.

whole-match: Displays the exactly matched routes.

Description Use the **display bgp routing community** command to display BGP routing information with the specified BGP community.

Examples # Display routing information with the specified BGP community.

```
<Sysname> display bgp routing-table community 11:22

 BGP Local router ID is 10.10.10.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

 *>  10.10.10.0/24     0.0.0.0         0                   0      i
 *>  40.40.40.0/24      20.20.20.1                             0       200 300i
```

Refer to Table 219 for description on the fields above.

display bgp routing-table community-list

Syntax **display bgp routing-table community-list** { *basic-community-list-number* [**whole-match**] | *adv-community-list-number* }&<1-16>

View Any view

Parameters *basic-community-list-number*: Specifies a basic community-list number from 1 to 99.

adv-community-list-number: Specifies an advanced community-list number from 100 to 199.

whole-match: Displays routes exactly matching the specified *basic-community-list*.

&<1-16>: Specifies the argument before it can be entered up to 16 times.

Description Use the **display bgp routing-table community-list** command to display BGP routing information matching the specified BGP community list.

Examples # Display BGP routing information matching BGP community list 100.

```
<Sysname> display bgp routing-table community-list 100
 BGP Local router ID is 1.2.3.4
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed,
 Origin codes: i - IGP, e - EGP, ? - incomplete
      Network            NextHop        Metric     LocPrf    PrefVal Path

 *>   3.3.3.0/30         1.2.3.4                              0       ?
 *>   4.4.0.0/20         1.2.3.4                              0       ?
 *>   4.5.6.0/26         1.2.3.4                              0       ?

 BGP Local router ID is 30.30.30.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network           NextHop       MED        LocPrf    PrefVal Path/Ogn

 *>  30.30.30.0/24     0.0.0.0       0                    0       i
 *>  40.40.40.0/24     0.0.0.0       0                    0       i
```

Refer to Table 219 for description on the fields above.

display bgp routing-table dampened

Syntax **display bgp routing-table dampened**

View Any view

Parameters None

Description Use the **display bgp routing-table dampened** command to display dampened BGP routes.

Examples # Display dampened BGP routes.

```
<Sysname> display bgp routing-table dampened
 BGP Local router ID is 2.2.2.2
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network            From             Reuse     Path/Origin
 *d  77.0.0.0           12.1.1.1         00:29:20  100?
```

Table 220 Description on the fields of the display bgp routing-table dampened command

Field	Description
From	IP address from which the route was received
Reuse	Reuse time of the route

Refer to Table 219 for description on the other fields above.

display bgp routing-table dampening parameter

Syntax **display bgp routing-table dampening parameter**

View Any view

Parameters None

Description Use the **display bgp routing-table dampening parameter** command to display BGP route dampening parameters.

Related commands: **dampening (BGP/BGP-VPN instance view)**.

Examples # Display BGP route dampening parameters.

```
<Sysname> display bgp routing-table dampening parameter
 Maximum Suppress Time(in second) : 3069
 Ceiling Value                    : 16000
 Reuse Value                      : 750
 HalfLife Time(in  second)        : 900
 Suppress-Limit                   : 2000
```

Table 221 Description on the fields of the display bgp routing-table dampening parameter command

Field	Description
Maximum Suppress Time	Maximum Suppress Time
Ceiling Value	Upper limit of penalty value
Reuse Value	Limit for a route to be desuppressed
HalfLife Time	Half-life time of active routes
Suppress-Limit	Limit for a route to be suppressed

display bgp routing-table different-origin-as

Syntax **display bgp routing-table different-origin-as**

View Any view

Parameters None

Description Use the **display bgp routing-table different-origin-as** command to display BGP routes originating from different autonomous systems.

Examples # Display BGP routes originating from different ASs.

```
<Sysname> display bgp routing-table different-origin-as
 BGP Local router ID is 2.2.2.2
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network           NextHop         MED        LocPrf     PrefVal Path/Ogn

 *>  55.0.0.0         12.1.1.1       0                   0       100?
 *                   14.1.1.2       0                   0       300?
```

Refer to Table 219 for description on the fields above.

display bgp routing-table flap-info

Syntax **display bgp routing-table flap-info** [**regular-expression** *as-regular-expression* | **as-path-acl** *as-path-acl-number* | *ip-address* [{ *mask* | *mask-length* } [**longer-match**]]]

View Any view

Parameters *as-regular-expression*: Displays route flap information that matches the AS path regular expression.

as-path-acl-number: Displays route flap information matching the AS path ACL. The number is in the range 1 to 256.

ip-address: Destination IP address.

mask: Mask, in dotted decimal notation.

mask-length: Mask length, in the range 0 to 32.

longer-match: Matches the longest prefix.

Description Use the **display bgp routing-table flap-info** command to display BGP route flap statistics. If no parameter is specified, this command displays all BGP route flap statistics.

Examples # Display BGP route flap statistics.

```
<Sysname> display bgp routing-table flap-info

 BGP Local router ID is 2.2.2.2
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network        From        Flaps  Duration   Reuse     Path/Origin

 *>  55.0.0.0       12.1.1.1    2      00:00:16             100?
 *d  77.0.0.0       12.1.1.1    5      00:34:02   00:27:08  100?
```

Table 222 Description on the fields of the display bgp routing flap-info command

Field	Description
From	Source IP address of the route
Flaps	Number of routing flaps
Duration	Duration time of the flap route
Reuse	Reuse time of the flap route

Refer to Table 219 for description on the other fields above.

display bgp routing-table peer

Syntax **display bgp routing-table peer** *ip-address* { **advertised-routes** | **received-routes** } [*network-address* [*mask* | *mask-length*] | **statistic**]

View Any view

Parameters *ip-address*: IP address of a peer.

advertised-routes: Displays routing information advertised to the specified peer.

received-routes: Displays routing information received from the specified peer.

network-address: IP address of the destination network.

mask: Mask of the destination network, in dotted decimal notation.

mask-length: Mask length, in the range 0 to 32.

statistic: Displays route statistics.

Description Use the **display bgp routing-table peer** command to display BGP routing information advertised to or received from the specified BGP peer.

Related commands: **display bgp peer**.

Examples # Display BGP routing information advertised to BGP peer 20.20.20.1.

```
<Sysname> display bgp routing-table peer 20.20.20.1 advertised-routes

 Total Number of Routes: 2

 BGP Local router ID is 30.30.30.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

 *>  30.30.30.0/24     0.0.0.0        0                     0       i
 *>  40.40.40.0/24     0.0.0.0        0                     0       i
```

Refer to Table 219 for description on the fields above.

display bgp routing-table regular-expression

Syntax **display bgp routing-table regular-expression** *as-regular-expression*

View Any view

Parameters *as-regular-expression*: AS regular expression.

Description Use the **display bgp routing-table regular-expression** command to display BGP routing information matching the specified AS regular expression.

Examples # Display BGP routing information matching AS regular expression 300$.

```
<Sysname> display bgp routing-table regular-expression 300$

 BGP Local router ID is 20.20.20.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete
     Network           NextHop       MED        LocPrf    PrefVal Path/Ogn

 *>  40.40.40.0/24     30.30.30.1    0                    0       300i
```

Refer to Table 219 for description on the fields above.

display bgp routing-table statistic

Syntax **display bgp routing-table statistic**

View Any view

Parameters None

Description Use the **display bgp routing-table statistic** command to display BGP routing statistics.

Examples # Display BGP routing statistics.

```
<Sysname> display bgp routing-table statistic

 Total Number of Routes: 4
```

Table 223 Description on the fields of the display bgp routing-table statistic command

Field	Description
Total number of routes	Total number of routes

ebgp-interface-sensitive

Syntax **ebgp-interface-sensitive**

undo ebgp-interface-sensitive

View BGP view/BGP-VPN instance view

Parameters None

Description Use the **ebgp-interface-sensitive** command to enable the clearing of EBGP session on any interface that becomes down.

Use the **undo ebgp-interface-sensitive** command to disable the function.

This function is enabled by default.

Examples # In BGP view, enable the clearing of EBGP session on any interface that becomes down.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ebgp-interface-sensitive
```

In BGP-VPN instance view, enable the clearing of EBGP session on any interface that becomes down (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] ebgp-interface-sensitive
```

filter-policy export (BGP/BGP-VPN instance view)

Syntax **filter-policy** { *acl-number* | **ip-prefix** *ip-prefix-name* } **export** [**direct** | **isis** *process-id* | **ospf** *process-id* | **rip** *process-id* | **static**]

undo filter-policy export [**direct** | **isis** *process-id* | **ospf** *process-id* | **rip** *process-id* | **static**]

View BGP view/BGP-VPN instance view

Parameters *acl-number*: Number of an ACL used to filter outgoing redistributed routing information, ranging from 2000 to 3999.

ip-prefix-name: Name of an IP prefix list used to filter outgoing redistributed routing information, a string of 1 to 19 characters.

direct: Filters direct routes.

isis *process-id*: Filters outgoing routes redistributed from an ISIS process. The ID is in the range 1 to 65535.

ospf *process-id*: Filters outgoing routes redistributed from the OSPF process with an ID from 1 to 65535.

rip *process-id*: Filters outgoing routes redistributed from a RIP process. The ID is in the range 1 to 65535.

static: Filters static routes.

If no routing protocol is specified, all outgoing routes are filtered.

Description Use the **filter-policy export** command to filter outgoing redistributed routes and only the routes permitted by the specified filter can be advertised.

Use the **undo filter-policy export** command to remove the filtering.

If no routing protocol is specified, the filtering applies to all outgoing redistributed routes.

By default, the filtering is not configured.

Examples # In BGP view, reference ACL 2000 to filter all outgoing redistributed routes.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] filter-policy 2000 export
```

In BGP-VPN instance view, reference ACL 2000 to filter all outgoing redistributed routes (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] filter-policy 2000 export
```

filter-policy import (BGP/BGP-VPN instance view)

Syntax **filter-policy** { *acl-number* | **ip-prefix** *ip-prefix-name* } **import**

undo filter-policy import

View BGP view/BGP-VPN instance view

Parameters *acl-number*: Number of an ACL used to filter incoming routing information, ranging from 2000 to 3999.

ip-prefix-name: Name of an IP prefix list used to filter incoming routing information, a string of 1 to 19 characters.

Description Use the **filter-policy import** command to configure the filtering of incoming routing information.

Use the **undo filter-policy import** command to remove the filtering.

By default, incoming routing information is not filtered.

Examples # In BGP view, reference ACL 2000 to filter incoming routing information.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] filter-policy 2000 import
```

In BGP-VPN instance view, reference ACL 2000 to filter incoming routing information (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] filter-policy 2000 import
```

graceful-restart (BGP view)

Syntax **graceful-restart**

undo graceful-restart

View BGP view

Parameters None

Description Use the **graceful-restart** command to enable BGP Graceful Restart capability.

Use the **undo graceful-restart** command to disable BGP Graceful Restart capability.

By default, BGP Graceful Restart capability is disabled.

When a GR-capable BGP speaker restarts, the address family to which the speaker belongs can still maintain the forwarding state and send the End-Of-RIB marker, but the BGP speaker may not maintain its forwarding table.

Examples # Enable the Graceful Restart capability for BGP process 100.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] graceful-restart
```

graceful-restart timer restart

Syntax **graceful-restart timer restart** *timer*

undo graceful-restart timer restart

View BGP view

Parameters *timer*: Maximum time for a peer to reestablish a BGP session, in the range 3 to 600 seconds.

Description Use the **graceful-restart timer restart** command to configure the maximum time for a peer to reestablish a BGP session.

Use the **undo graceful-restart timer restart** command to restore the default.

By default, the maximum time for a peer to reestablish a BGP session is 150 seconds.

Examples # Configure the maximum time for a peer to reestablish a BGP session as 300 seconds.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] graceful-restart timer restart 300
```

graceful-restart timer wait-for-rib

Syntax **graceful-restart timer wait-for-rib** *timer*

undo graceful-restart timer wait-for-rib

View BGP view

Parameters *timer*: Time to wait for the End-of-RIB marker, in the range 3 to 300 seconds.

Description Use the **graceful-restart timer wait-for-rib** command to configure the time to wait for the End-of-RIB marker.

Use the **undo graceful-restart timer wait-for-rib** command to restore the default.

By default, the time to wait for the End-of-RIB marker is 180 seconds.

- *After a BGP session has been successfully (re)established, the End-of-RIB marker must be received within the time specified with this command.*
- *Using this command can speed up route convergence.*

Examples # Set the time to wait for the End-of-RIB marker to 100 seconds.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] graceful-restart timer wait-for-rib 100
```

group (BGP/BGP-VPN instance view)

Syntax **group** *group-name* [**external** | **internal**]

undo group *group-name*

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

external: Creates an EBGP peer group, which can be the group of another sub AS in a confederation.

internal: Creates an IBGP peer group; not supported in BGP-VPN instance view.

Description Use the **group** command to create a peer group.

Use the **undo group** command to delete a peer group.

An IBGP peer group is created if neither **internal** nor **external** is specified.

Examples # In BGP view, create an EBGP peer group **test** with AS number 200, and add EBGP peers 10.1.1.1 and 10.1.2.1 into the group.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] group test external
[Sysname-bgp] peer test as-number 200
[Sysname-bgp] peer 10.1.1.1 group test
[Sysname-bgp] peer 10.1.2.1 group test
```

In BGP-VPN instance view, create an EBGP peer group **test** with AS number 200, and add EBGP peers 10.1.1.1 and 10.1.2.1 into the group (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] group test external
[Sysname-bgp-vpn1] peer test as-number 200
[Sysname-bgp-vpn1] peer 10.1.1.1 group test
[Sysname-bgp-vpn1] peer 10.1.2.1 group test
```

import-route (BGP/BGP-VPN instance view)

Syntax **import-route** *protocol* [*process-id* [**med** *med-value* | **route-policy** *route-policy-name*] *]

undo import-route *protocol* [*process-id*]

View BGP view/BGP-VPN instance view

Parameters *protocol*: Redistributes routes from the specified routing protocol, which can be **direct**, **isis**, **ospf**, **rip**, or **static** at present.

process-id: Process ID, in the range 1 to 65535. The default is 1. It is available only when the protocol is **isis**, **ospf**, or **rip**.

med-value: Specifies the MED value to be applied to redistributed routes, ranging from 0 to 4294967295. If the argument is not specified, the cost of the redistributed route is used as its MED in the BGP routing domain.

route-policy-name: Name of a routing policy used to filter redistributed routes, a string of 1 to 19 characters.

Description Use the **import-route** command to configure BGP to redistribute routes from a specified routing protocol and advertise redistributed routes.

Use the **undo import-route** command to disable route redistribution from a routing protocol.

By default, BGP does not redistribute routes from other protocols.

The ORIGIN attribute of routes redistributed with the **import-route** command is incomplete.

Examples # In BGP view, redistribute routes from RIP.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] import-route rip
```

In BGP-VPN instance view, redistribute routes from RIP (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] import-route rip
```

log-peer-change

Syntax **log-peer-change**

undo log-peer-change

View BGP view

Parameters None

Description Use the **log-peer-change** command to enable the global BGP logging on peers going up and down.

Use the **undo log-peer-change** command to disable the function.

By default, the function is enabled.

Examples # Enable BGP logging on peers going up and down.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] log-peer-change
```

network (BGP/BGP-VPN instance view)

Syntax **network** *ip-address* [*mask* | *mask-length*] [**short-cut** | **route-policy** *route-policy-name*]

undo network *ip-address* [*mask* | *mask-length*] [**short-cut**]

View BGP view/BGP-VPN instance view

Parameters *ip-address*: Destination IP address.

mask: Mask of the network address, in dotted decimal notation.

mask-length: Mask length, in the range 0 to 32.

short-cut: Specifies the route to use the local preference. If the route is an EBGP route whose preference is higher than the local one, using this keyword can configure the EBGP route to use the local preference, so the route is hard to become the optimal route.

route-policy-name: Routing policy applied to the route. The name is a string of 1 to 19 characters.

Description Use the **network** command to inject a network to the local BGP routing table.

Use the **undo network** command to remove a network from the routing table.

By default, no network route is injected.

Note that:

- The network route must be in the local IP routing table, and using a routing policy makes route management more flexible.
- The route injected to the BGP routing table using the **network** command has the ORIGIN attribute as IGP.

Examples # In BGP view, inject the network segment 10.0.0.0/16.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] network 10.0.0.0 255.255.0.0
```

In BGP-VPN instance view, inject the network segment 10.0.0.0/16 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] network 10.0.0.0 255.255.0.0
```

peer advertise-community (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **advertise-community**

undo peer { *group-name* | *ip-address* } **advertise-community**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer advertise-community** command to advertise the community attribute to a peer/peer group.

Use the **undo peer advertise-community** command to disable the community attribute advertisement to a peer/peer group.

By default, no community attribute is advertised to any peer group/peer.

Related commands: **ip community-list**, **if-match community**, **apply community**.

Examples # In BGP view, advertise the community attribute to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test advertise-community
```

In BGP-VPN instance view, advertise the community attribute to peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test advertise-community
```

peer advertise-ext-community (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **advertise-ext-community**

undo peer { *group-name* | *ip-address* } **advertise-ext-community**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer advertise-ext-community** command to advertise the extended community attribute to a peer/peer group.

Use the **undo peer advertise-ext-community** command to disable the advertisement.

By default, no extended community attribute is advertised to a peer/peer group.

For related information, refer to "ip extcommunity-list" on page 1205, "if-match extcommunity" on page 1199 and "apply extcommunity" on page 1190.

Examples # In BGP view, advertise the extended community attribute to the peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test advertise-ext-community
```

In BGP-VPN view, advertise the extended community attribute to the peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test advertise-community
```

peer allow-as-loop (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **allow-as-loop** [*number*]

undo peer { *group-name* | *ip-address* } **allow-as-loop**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

number: Specifies the repeating times of the local AS number, in the range 1 to 10. The default number is 1.

Description Use the **peer allow-as-loop** command to allow the local AS number to exist in the AS_PATH attribute of routes from a peer/peer group, and to configure the repeating times of the local AS number.

Use the **undo peer allow-as-loop** command to remove the configuration.

By default, the local AS number is allowed.

Related commands: **display bgp routing-table peer**.

Examples # In BGP view, configure the repeating times of the local AS number as 2 for routes from peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 1.1.1.1 allow-as-loop 2
```

In BGP-VPN instance view, configure the repeating times of the local AS number as 2 for routes from peer 1.1.1.1 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 1.1.1.1 allow-as-loop 2
```

peer as-number (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **as-number** *as-number*

undo peer *group-name* **as-number**

undo peer *ip-address*

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

as-number: AS number of the peer or peer group, in the range 1 to 65535.

Description Use the **peer as-number** command to specify the AS number for a peer/peer group.

Use the **undo peer as-number** command to delete the AS number of a peer group.

Use the **undo peer** command to delete a peer.

By default, no AS number is configured for a peer/peer group.

Examples # In BGP view, specify the AS number of the peer group **test** as 100.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test as-number 100
```

In BGP-VPN instance view, specify the AS number of the peer group **test** as 100 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test as-number 100
```

peer as-path-acl (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **as-path-acl** *as-path-acl-number* { **export** | **import** }

undo peer { *group-name* | *ip-address* } **as-path-acl** *as-path-acl-number* { **export** | **import** }

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

as-path-acl-number: AS path ACL number, in the range 1 to 256.

export: Filters outgoing routes.

import: Filters incoming routes.

Description Use the **peer as-path-acl** command to configure the filtering of routes incoming from or outgoing to a peer/peer group based on a specified AS path ACL.

Use the **undo peer as-path-acl** command to remove the configuration.

By default, no AS path ACL filtering is configured.

Related commands: **ip as-path** *acl*, **if-match as-path** and **apply as-path**.

Examples # In BGP view, reference the AS path ACL 1 to filter routes outgoing to the peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test as-path-acl 1 export
```

In BGP-VPN instance view, reference the AS path ACL 1 to filter routes outgoing to the peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test as-path-acl 1 export
```

peer capability-advertise conventional

Syntax **peer** { *group-name* | *ip-address* } **capability-advertise conventional**

undo peer { *group-name* | *ip-address* } **capability-advertise conventional**

View BGP view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer capability-advertise conventional** command to disable BGP multi-protocol extension and route refresh for a peer/peer group.

Use the **undo peer capability-advertise** command to enable BGP multi-protocol extension and route refresh for a peer/peer group.

By default, BGP multi-protocol extension and route refresh are enabled.

Examples # In BGP view, disable multi-protocol extension and route refresh for peer 160.89.2.33.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 160.89.2.33 as-number 100
[Sysname-bgp] peer 160.89.2.33 capability-advertise conventional
```

peer capability-advertise route-refresh

Syntax **peer** { *group-name* | *ip-address* } **capability-advertise route-refresh**

undo peer { *group-name* | *ip-address* } **capability-advertise route-refresh**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer capability-advertise route-refresh** command to enable the BGP route refresh capability.

Use the **undo peer capability-advertise route-refresh** command to disable the capability.

The capability is enabled by default.

Examples # In BGP view, enable BGP route refresh for peer 160.89.2.33.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 160.89.2.33 as-number 100
[Sysname-bgp] peer 160.89.2.33 capability-advertise route-refresh
```

In BGP-VPN instance view, enable BGP route refresh for peer 160.89.2.33 (The VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 160.89.2.33 as-number 100
[Sysname-bgp-vpn1] peer 160.89.2.33 capability-advertise route-refresh
```

peer connect-interface (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **connect-interface** *interface-type interface-number*

undo peer { *group-name* | *ip-address* } **connect-interface**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string 1 to 47 characters.

ip-address: IP address of a peer.

interface-type interface-number: Specifies the type and number of the interface.

Description Use the **peer connect-interface** command to specify the source interface for establishing TCP connections to a peer/peer group.

Use the **undo peer connect-interface** command to restore the default.

By default, BGP uses the outbound interface of the best route to the BGP peer/peer group as the source interface for establishing a TCP connection to the peer/peer group.

Note that:

To establish multiple BGP connections to another BGP router, you need to specify on the local router the respective source interfaces for establishing TCP connections to the peers on the peering BGP router because the local BGP router may fail to establish TCP connections to the peers when using the outbound interfaces of the best routes as the source interfaces.

Examples # In BGP view, specify loopback 0 as the source interface for routing updates to the peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test connect-interface loopback 0
```

In BGP-VPN instance view, specify loopback 0 as the source interface for routing updates to the peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test connect-interface loopback 0
```

peer default-route-advertise (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **default-route-advertise** [**route-policy** *route-policy-name*]

undo peer { *group-name* | *ip-address* } **default-route-advertise**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

route-policy-name: Routing policy name, a string of 1 to 19 characters.

Description Use the **peer default-route-advertise** command to advertise a default route to a peer/peer group.

Use the **undo peer default-route-advertise** command to disable default route advertisement to a peer/peer group.

By default, no default route is advertised to a peer/peer group.

With this command used, the router unconditionally sends a default route with the next hop being itself to the peer/peer group regardless of whether the default route is available in the routing table.

Examples # In BGP view, advertise a default route to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test default-route-advertise
```

In BGP-VPN instance view, advertise a default route to peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test default-route-advertise
```

peer description (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **description** *description-text*

undo peer { *group-name* | *ip-address* } **description**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

description-text: Description information for the peer/peer group, a string of 1 to 79 characters.

Description Use the **peer description** command to configure the description information for a peer/peer group.

Use the **undo peer description** command to remove the description information of a peer/peer group.

By default, no description information is configured for a peer/peer group.

Create a peer/peer group before configuring a description for it.

Related commands: **display bgp peer**.

Examples # In BGP view, configure the description information of the peer group test as ISP1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test description ISP1
```

In BGP-VPN instance view, configure the description information of the peer group test as ISP1(the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test description ISP1
```

peer ebgp-max-hop (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **ebgp-max-hop** [*hop-count*]

undo peer { *group-name* | *ip-address* } **ebgp-max-hop**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

hop-count: Maximum hop count, in the range 1 to 255. The default is 64.

Description Use the **peer ebgp-max-hop** command to allow establishing an EBGP connection with a peer/peer group that is on an indirectly connected network.

Use the **undo peer ebgp-max-hop** command to restore the default.

By default, this feature is disabled.

You can use the argument *hop-count* to specify the maximum route count of the EBGP connection.

Examples # In BGP view, allow establishing the EBGP connection with the peer group **test** that is on an indirectly connected network.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test ebgp-max-hop
```

In BGP-VPN instance view, allow establishing the EBGP connection with the peer group **test** that is on an indirectly connected network (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test ebgp-max-hop
```

peer enable (BGP view)

Syntax **peer** *ip-address* **enable**

undo peer *ip-address* **enable**

View BGP view

Parameters *ip-address*: IP address of a peer.

Description Use the **peer enable** command to enable the specified peer.

Use the **undo peer enable** command to disable the specified peer.

By default, the BGP peer is enabled.

If a peer is disabled, the router will not exchange routing information with the peer.

Examples # Disable peer 18.10.0.9.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 18.10.0.9 group group1
[Sysname-bgp] undo peer 18.10.0.9 enable
```

peer fake-as (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **fake-as** *as-number*

undo peer { *group-name* | *ip-address* } **fake-as**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

as-number: Local autonomous system number, in the range 1 to 65535.

Description Use the **peer fake-as** command to configure a fake local AS number for a peer or peer group.

Use the **undo peer fake-as** command to remove the configuration.

By default, no fake local AS number is configured for a peer or peer group.

*The **peer fake-as** command is only applicable to an EBGP peer or peer group.*

Examples # In BGP view, configure a fake AS number of 200 for the peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test fake-as 200
```

In BGP-VPN instance view, configure a fake AS number of 200 for the peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test fake-as 200
```

peer filter-policy (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **filter-policy** *acl-number* { **export** | **import** }

undo peer { *group-name* | *ip-address* } **filter-policy** [*acl-number*] { **export** | **import** }

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

acl-number: ACL number, in the range 2000 to 3999.

export: Applies the filter-policy to routes advertised to the peer/peer group.

import: Applies the filter-policy to routes received from the peer/peer group.

Description Use the **peer filter-policy** command to configure an ACL-based filter policy for a peer or peer group.

Use the **undo peer filter-policy** command to remove the configuration.

By default, no ACL-based filter policy is configured for a peer or peer group.

Related commands: **peer as-path-acl (BGP/BGP-VPN instance view)**.

Examples # In BGP view, apply the ACL 2000 to filter routes advertised to the peer group test.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test filter-policy 2000 export
```

In BGP-VPN instance view, apply the ACL 2000 to filter routes advertised to the peer group test (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test filter-policy 2000 export
```

peer group (BGP/BGP-VPN instance view)

Syntax **peer** *ip-address* **group** *group-name* [**as-number** *as-number*]

undo peer *ip-address* **group** *group-name*

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

as-number: AS number of the peer, in the range 1 to 65535.

Description Use the **peer group** command to add a peer to a peer group.

Use the **undo peer group** command to delete a specified peer from a peer group.

By default, no peer is added into a peer group.

Examples # In BGP view, add the peer 10.1.1.1 to the EBGP peer group test.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] group test external
[Sysname-bgp] peer test as-number 2004
[Sysname-bgp] peer 10.1.1.1 group test
```

In BGP-VPN view, add the peer 10.1.1.1 to the EBGP peer group test (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] group test external
[Sysname-bgp-vpn1] peer test as-number 2004
[Sysname-bgp-vpn1] peer 10.1.1.1 group test
```

peer ignore (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **ignore**

undo peer { *group-name* | *ip-address* } **ignore**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer ignore** command to disable session establishment with a peer or peer group.

Use the **undo peer ignore** command to remove the configuration.

By default, session establishment with a peer or peer group is allowed.

After the **peer ignore** command is executed, the system disables the session with the specified peer or peer group and clears all the related routing information. For a peer group, this means all sessions with the peer group will be tore down.

Examples # In BGP view, disable session establishment with peer 10.10.10.10.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 10.10.10.10 ignore
```

In BGP-VPN instance view, disable session establishment with peer 10.10.10.10 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 10.10.10.10 ignore
```

peer ip-prefix

Syntax **peer** { *group-name* | *ip-address* } **ip-prefix** *ip-prefix-name* { **export** | **import** }

undo peer { *group-name* | *ip-address* } **ip-prefix** { **export** | **import** }

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

ip-prefix-name: IP prefix list name, a string of 1 to 19 characters.

export: Applies the filter to routes advertised to the specified peer/peer group.

import: Applies the filter to routes received from the specified peer/peer group.

Description Use the **peer ip-prefix** command to reference an IP prefix list to filter routes received from or advertised to a peer or peer group.

Use the **undo peer ip-prefix** command to remove the configuration.

By default, no IP prefix list is specified.

Examples # In BGP view, use the IP prefix list **list 1** to filter routes advertised to the peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test ip-prefix list1 export
```

In BGP-VPN view, use the IP prefix list **list 1** to filter routes advertised to the peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test ip-prefix list1 export
```

peer keep-all-routes (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **keep-all-routes**

undo peer { *group-name* | *ip-address* } **keep-all-routes**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer keep-all-routes** command to save original routing information from a peer or peer group, even routes that failed to pass the inbound policy (if configured).

Use the **undo peer keep-all-routes** command to disable this function.

By default, the function is not enabled.

Examples # In BGP view, save routing information from peer 131.100.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 131.100.1.1 as-number 200
[Sysname-bgp] peer 131.100.1.1 keep-all-routes
```

In BGP-VPN instance view, save routing information from peer 131.100.1.1(the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 131.100.1.1 as-number 200
[Sysname-bgp-vpn1] peer 131.100.1.1 keep-all-routes
```

peer log-change (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **log-change**

undo peer { *group-name* | *ip-address* } **log-change**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer log-change** command to enable the logging of session state and event information for a specified peer or peer group.

Use the **undo peer log-change** command to remove the configuration.

The logging is enabled by default.

Examples # In BGP view, enable the logging of session state and event information for peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test log-change
```

In BGP-VPN instance view, enable the logging of session state and event information for peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test log-change
```

peer next-hop-local (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **next-hop-local**

undo peer { *group-name* | *ip-address* } **next-hop-local**

View BGP view /BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer next-hop-local** command to specify the router as the next hop for routes to a peer/peer group.

Use the **undo peer next-hop-local** command to remove the configuration.

By default, routes advertised to an EBGP peer/peer group take the local router as the next hop, while routes to an IBGP peer/peer group do not take the local router as the next hop.

Examples # In BGP view, set the next hop of routes advertised to peer group **test** to the router itself.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test next-hop-local
```

In BGP-VPN instance view, set the next hop of routes advertised to peer group **test** to the router itself (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test next-hop-local
```

peer password

Syntax **peer** { *group-name* | *ip-address* } **password** { **cipher** | **simple** } *password*

undo peer { *group-name* | *ip-address* } **password**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

cipher: Displays the configured password in cipher text format.

simple: Displays the configured password in plain text format.

password: Password, a string of 1 to 80 characters when keyword **simple** is used, or when keyword **cipher** is included and plain text password is input; a string of 24 or 108 characters when cipher text password and the keyword **cipher** are used.

Description Use the **peer password** command to configure BGP to perform MD5 authentication when a TCP connection is being established with a peer/peer group.

Use the **undo peer password** command to disable the function.

By default, no MD5 authentication is performed for TCP connection establishment.

Once MD5 authentication is enabled, both parties must be configured with the same authentication mode and password. Otherwise, the TCP connection will not be set up.

Examples # In BGP view, perform MD5 authentication on the TCP connection set up between the local router 10.1.100.1 and the peer router 10.1.100.2.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 10.1.100.2 password simple aabbcc
```

Perform the similar configuration on the peer.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 10.1.100.1 password simple aabbcc
```

In BGP-VPN instance view, perform MD5 authentication on the TCP connection set up between the local router 10.1.100.1 and the peer router 10.1.100.2(the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 10.1.100.2 password simple aabbcc
```

Perform the similar configuration on the peer.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 10.1.100.1 password simple aabbcc
```

peer preferred-value (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **preferred-value** *value*

undo peer { *group-name* | *ip-address* } **preferred-value**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

value: Preferred value, in the range 0 to 65535.

Description Use the **peer preferred-value** command to assign a preferred value to routes received from a peer or peer group.

Use the **undo peer preferred-value** command to restore the default value.

The default preferred value is 0.

Routes learned from a peer have an initial preferred value.

Among multiple routes that have the same destination/mask and are learned from different peers, the one with the biggest preferred value is selected as the route to the network.

Note that:

If you both reference a routing policy and use the **peer** { *group-name* | *ip-address* } **preferred-value** *value* command to set a preferred value for routes from a peer, the routing policy sets a specified non-zero preferred value for routes matching it. Other routes not matching the routing policy uses the value set with the command. If the preferred value specified in the routing policy is zero, the routes matching it will also use the value set with the command. For information about using a routing policy to set a preferred value, refer to **"peer group (BGP/BGP-VPN instance view)" on page 994**, **"peer route-policy (BGP/BGP-VPN instance view)" on page 1002** { **export** | **import** } in this document, and **"apply preferred-value" on page 1194**

Examples # In BGP view, configure the preferred value as 50 for routes from peer 131.108.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 131.108.1.1 preferred-value 50
```

In BGP-VPN instance view, configure the preferred value as 50 for routes from peer 131.108.1.1 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 131.108.1.1 preferred-value 50
```

peer public-as-only (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **public-as-only**

undo peer { *group-name* | *ip-address* } **public-as-only**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer public-as-only** command to not keep private AS numbers in BGP updates sent to a peer/peer group.

Use the **undo peer public-as-only** command to keep private AS numbers in BGP updates sent to a peer/peer group.

By default, BGP updates carry private AS numbers.

The command does not take effect if the BGP update has both public and private AS numbers. The range of private AS number is from 64512 to 65535.

Examples # In BGP view, carry no private AS number in BGP updates sent to the peer **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test public-as-only
```

In BGP-VPN instance view, carry no private AS number in BGP updates sent to the peer **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test public-as-only
```

peer reflect-client (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **reflect-client**

undo peer { *group-name* | *ip-address* } **reflect-client**

View BGP view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer reflect-client** command to configure the router as a router reflector and specify a peer/peer group as a client.

Use the **undo peer reflect-client** command to remove the configuration.

By default, neither route reflector nor client is configured.

Related commands: **reflect between-clients (BGP view)** and **reflector cluster-id (BGP view)**.

Examples # In BGP view, configure the local device as a router reflector and specify the IBGP peer group **test** as a client.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test reflect-client
```

peer route-limit (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **route-limit** *limit* [*percentage*]

undo peer { *group-name* | *ip-address* } **route-limit**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

limit: Upper limit of IP prefixes that can be received from the peer or peer group, in the range 1 to 10000.

percentage: If the number of received routes reaches the specified percentage of the upper limit, the system will generate alarm information. The percentage is in the range from 1 to 100. The default is 75.

Description Use the **peer route-limit** command to set the maximum number of routes that can be received from a peer/peer group.

Use the **undo peer route-limit** command to restore the default.

The number is unlimited by default.

Examples # In BGP view, set the number of routes that can be received from peer 129.140.6.6 to 10000.

```
<Sysname> system-view
[Sysname] bgp 109
[Sysname-bgp] peer 129.140.6.6 as-number 110
[Sysname-bgp] peer 129.140.6.6 route-limit 10000
```

In BGP-VPN instance view, set the maximum number of routes that can be received from peer 129.140.6.6 to 10000 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 109
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 129.140.6.6 as-number 110
[Sysname-bgp-vpn1] peer 129.140.6.6 route-limit 10000
```

peer route-policy (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **route-policy** *route-policy-name* { **export** | **import** }

undo peer { *group-name* | *ip-address* } **route-policy** *route-policy-name* { **export** | **import** }

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a string of 1 to 47 characters.

ip-address: IP address of a peer.

route-policy-name: Routing policy name, a string of 1 to 19 characters.

export: Applies the routing policy to routes outgoing to the peer (or peer group).

import: Applies the routing policy to routes incoming from the peer (or peer group).

Description Use the **peer route-policy** command to apply a routing policy to routes incoming from or outgoing to a peer or peer group.

Use the **undo peer route-policy** command to remove the configuration.

By default, no inbound/outbound routing policy is configured for the peer/peer group.

The **peer route-policy** command does not apply the **if-match interface** clause in the referenced routing policy. Refer to "route-policy" on page 1205 and "if-match interface" on page 1200

Examples # In BGP view, apply routing policy **test-policy** to routes outgoing to peer group **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test route-policy test-policy export
```

In BGP-VPN instance view, apply routing policy **test-policy** to routes outgoing to the peer group **test** (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test route-policy test-policy export
```

peer route-update-interval (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **route-update-interval** *seconds*

undo peer { *group-name* | *ip-address* } **route-update-interval**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a sting of 1 to 47 characters.

ip-address: IP address of a peer.

seconds: Minimum interval for sending the same update message. The range is 5 to 600 seconds.

Description Use the **peer route-update-interval** command to specify the interval for sending the same update to a peer/peer group.

Use the **undo peer route-update-interval** command to restore the default value.

By default, the interval is 5 seconds for IBGP peers, and 30 seconds for EBGP peers.

Examples # In BGP view, specify the interval for sending the same update to peer group **test** as 10 seconds.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test as-number 100
[Sysname-bgp] peer test route-update-interval 10
```

In BGP-VPN instance view, specify the interval for sending the same update to peer group **test** as 10 seconds (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test as-number 100
[Sysname-bgp-vpn1] peer test route-update-interval 10
```

peer substitute-as (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **substitute-as**

undo peer { *group-name* | *ip-address* } **substitute-as**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a sting of 1 to 47 characters.

ip-address: IP address of a peer.

Description Use the **peer substitute-as** command to replace the AS number of a peer/peer group in the AS_PATH attribute with the local AS number.

Use the **undo peer substitute-as** command to remove the configuration.

No AS number is replaced by default.

Examples # In BGP view, substitute local AS number for AS number of peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer 1.1.1.1 substitute-as
```

In BGP-VPN instance view, substitute local AS number for AS number of peer 1.1.1.1 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer 1.1.1.1 substitute-as
```

peer timer (BGP/BGP-VPN instance view)

Syntax **peer** { *group-name* | *ip-address* } **timer keepalive** *keepalive* **hold** *holdtime*

undo peer { *group-name* | *ip-address* } **timer**

View BGP view/BGP-VPN instance view

Parameters *group-name*: Name of a peer group, a sting of 1 to 47 characters.

ip-address: IP address of a peer.

keepalive: Keepalive interval in seconds, ranging from 1 to 21845.

holdtime: Holdtime interval in seconds, ranging from 3 to 65535.

Description Use the **peer timer** command to configure the keepalive interval and holdtime interval for a peer or peer group.

Use the **undo peer timer** command to restore the default.

By default, the *keepalive* and *holdtime* are 60s and 180s respectively.

Note that:

- The timer configured with this command is preferred to the timer configured with the **timer** command.
- The holdtime interval must be at least three times the keepalive interval.

Related commands: **timer (BGP/BGP-VPN instance view)**.

Examples # In BGP view, configure the keepalive interval and holdtime interval for peer group **test** as 60s and 180s.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] peer test timer keepalive 60 hold 180
```

In BGP-VPN instance view, configure the keepalive interval and holdtime interval for peer group **test** as 60s and 180s (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] peer test timer keepalive 60 hold 180
```

preference (BGP/BGP-VPN instance view)

Syntax **preference** { *external-preference internal-preference local-preference* | **route-policy** *route-policy-name* }

undo preference

View BGP view/BGP-VPN instance view

Parameters *external-preference*: Preference of EBGP route, in the range 1 to 255.

internal-preference: Preference of IBGP route, in the range 1 to 255. An IBGP is a route learned from another peer inside AS.

local-preference: Preference of local route, in the range 1 to 255.

route-policy-name: Routing policy name, a string of 1 to 19 characters. Using the routing policy can set preference for routes passing through it. For the routes filtered out, the default value applies.

Description Use the **preference** command to configure preferences for external, internal, and local routes.

Use the **undo preference** command to restore the default.

For *external-preference*, *internal-preference* and *local-preference*, the bigger the preference value is, the lower the preference is, and the default values are 255, 255, 130 respectively.

Examples # In BGP view, configure preferences for EBGP, IBGP and local routes as 20, 20 and 200.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] preference 20 20 200
```

In BGP-VPN instance view, configure preferences for EBGP, IBGP and local routes as 20, 20 and 200 (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] preference 20 20 200
```

reflect between-clients (BGP view)

Syntax **reflect between-clients**

undo reflect between-clients

View BGP view

Parameters None

Description Use the **reflect between-clients** command to enable route reflection between clients.

Use the **undo reflect between-clients** command to disable this function.

By default, route reflection between clients is enabled.

After a route reflector is configured, it reflects the routes of a client to other clients. If the clients of a route reflector are fully meshed, you need disable route reflection between clients to reduce routing costs.

Related commands: **reflector cluster-id (BGP view)** and **peer reflect-client (BGP/BGP-VPN instance view)**.

Examples # Disable route reflection between clients.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] undo reflect between-clients
```

reflector cluster-id (BGP view)

Syntax **reflector cluster-id** *cluster-id*

undo reflector cluster-id

View BGP view

Parameters *cluster-id*: Cluster ID of the route reflector, an integer from 1 to 4294967295 (the integer is translated into an IP address by the system) or an IP address.

Description Use the **reflector cluster-id** command to configure the cluster ID of the route reflector.

Use the **undo reflector cluster-id** command to remove the configured cluster ID.

By default, each route reflector uses its router ID as the cluster ID.

Usually, there is only one route reflector in a cluster. The router ID of the route reflector is the ID of the cluster. You can configure multiple route reflectors to improve the stability of the network. In this case, using this command can configure the identical cluster ID for all the route reflectors to avoid routing loops.

Related commands: **reflect between-clients (BGP view)** and **peer reflect-client (BGP/BGP-VPN instance view)**.

Examples # Set the cluster ID to 80.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] reflector cluster-id 80
```

refresh bgp

Syntax **refresh bgp** { **all** | *ip-address* | **group** *group-name* | **external** | **internal** } { **export** | **import** }

View User view

Parameters **all**: Soft-resets all BGP connections.

ip-address: Soft-resets the BGP connection to a peer.

group-name: Soft-resets connections to a peer group, name of which is a sting of 1 to 47 characters.

external: EBGP connection.

internal: IBGP connection.

export: Outbound soft reset.

import: Inbound soft reset.

Description Use the **refresh bgp** command to perform soft reset on specified BGP connections. Using this function can refresh the BGP routing table without tearing down BGP connections and apply a newly configured routing policy.

To perform BGP soft reset, all routers in the network must support route-refresh. If a router not supporting route-refresh exists in the network, you need to configure the **peer keep-all-routes** command to save all routing updates before performing soft reset.

Examples # Perform inbound BGP soft reset.

```
<Sysname> refresh bgp all import
```

reset bgp

Syntax **reset bgp** { **all** | *as-number* | *ip-address* [**flap-info**] | **group** *group-name* | **external** | **internal** }

View User view

Parameters **all**: Resets all BGP connections.

as-number: Resets BGP connections to peers in the AS.

ip-address: Specifies the IP address of a peer with which to reset the connection.

flap-info: Clears history information of routing flap.

group *group-name*: Specifies to reset connections with the specified BGP peer group.

external: Resets all the EBGP connections.

internal: Resets all the IBGP connections.

Description Use the **reset bgp** command to reset specified BGP connections.

Examples # Reset all the BGP connections.

```
<Sysname> reset bgp all
```

reset bgp dampening

Syntax **reset bgp dampening** [*ip-address* [*mask* | *mask-length*]]

View User view

Parameters *ip-address*: Destination IP address of a route.

mask: Mask, in dotted decimal notation.

mask-length: Mask length, in the range 0 to 32.

Description Use the **reset bgp dampening** command to clear route dampening information and release suppressed routes.

Related commands: **dampening (BGP/BGP-VPN instance view)**, **display bgp routing-table dampened**.

Examples # Clear damping information of route 20.1.0.0/16 and release suppressed route.

```
<Sysname> reset bgp dampening 20.1.0.0 255.255.0.0
```

reset bgp flap-info

Syntax **reset bgp flap-info** [**regexp** *as-path-regexp* | **as-path-acl** *as-path-acl-number* | *ip-address* [*mask* | *mask-length*]]

View User view

Parameters *as-path-regexp*: Clears the flap statistics of routes matching the AS path regular expression.

as-path-acl-number: Clears the flap statistics of routes matching an AS path ACL, number of which is in the range 1 to 256.

ip-address: Clears the flap statistics of a route.

mask: Network mask, in dotted decimal notation.

mask-length: Mask length, in the range 0 to 32.

Description Use the **reset bgp flap-info** command to clear the flap statistics of routes matching the specified filter.

The flap statistics of all the routes will be cleared if no parameter is specified.

Examples # Clear the flap statistics of all routes matching AS path ACL 10.

```
<Sysname> reset bgp flap-info as-path-acl 10
```

reset bgp ipv4 all

Syntax **reset bgp ipv4 all**

View User view

Parameters None

Description Use the **reset bgp ipv4 all** command to reset all the BGP connections of IPv4 unicast address family.

Examples # Reset all the BGP connections of IPv4 unicast address family.

```
<Sysname> reset bgp ipv4 all
```

router-id

Syntax **router-id** *router-id*

undo router-id

View BGP view

Parameters *router-id*: Router ID in IP address format.

Description Use the **router-id** command to specify a router ID.

Use the **undo router-id** command to remove a router ID.

To run BGP protocol, a router must have a router ID, which is an unsigned 32-bit integer, the unique ID of the router in the AS.

You can specify a router ID manually. If not, the system selects an IP address as the router ID. The selection sequence is the highest IP address among loopback interface addresses; if not available, then the highest IP address of interfaces. It is recommended to specify a loopback interface address as the router ID to enhance network reliability.

Only when the interface with the selected Router ID or the manual Router ID is deleted will the system select another ID for the router.

Examples # Specifies the Router ID as 10.18.4.221.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] router-id 10.18.4.221
```

summary automatic

Syntax **summary automatic**

undo summary automatic

View BGP view/BGP-VPN instance view

Parameters None

Description Use the **summary automatic** command to enable automatic summarization for redistributed subnets.

Use the **undo summary automatic** command to disable automatic summarization.

By default, automatic summarization is disabled.

Note that:

- Neither the default route nor the routes imported using the **network** command can be summarized automatically.
- With this feature enabled, BGP limits the subnets redistribution from IGP to reduce the size of routing table.

Examples # In BGP view, enable automatic summarization.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] summary automatic
```

In BGP-VPN instance view, enable automatic summarization (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
```

```
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] summary automatic
```

synchronization (BGP view)

Syntax **synchronization**

undo synchronization

View BGP view

Parameters None

Description Use the **synchronization** command to enable the synchronization between the BGP and IGP routes.

Use the **undo synchronization** command to disable the synchronization.

The feature is disabled by default.

With this feature enabled and when a non-BGP router is responsible for forwarding packets in an AS, BGP speakers in the AS cannot advertise routing information to other ASs unless all routers in the AS know the latest routing information.

When a BGP router receives an IBGP route, it checks only whether the next hop is reachable by default. If the synchronization is enabled, the IBGP route is synchronized and advertised to EBGP peers only when the route is also advertised by IGP. Otherwise, the IBGP route cannot be advertised to EBGP peers.

Examples # Enable the synchronization between BGP and IGP routes.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] synchronization
```

timer (BGP/BGP-VPN instance view)

Syntax **timer keepalive** *keepalive* **hold** *holdtime*

undo timer

View BGP view/BGP-VPN instance view

Parameters *keepalive*: Keepalive interval in seconds, ranging from 1 to 21845.

holdtime: Holdtime interval in seconds, ranging from 3 to 65535.

Description Use the **timer** command to configure BGP keepalive interval and holdtime interval.

Use the **undo timer** command to restore the default.

By default, BGP keepalive and holdtime intervals are 60s and 180s.

Note that:

- Timer configured using the **peer timer** command is preferred to the timer configured using this command.
- The holdtime interval must be at least three times the keepalive interval.
- The configured timer applies to all the BGP peers, while it becomes valid only after the corresponding BGP connections are reset.

Related commands: **peer timer (BGP/BGP-VPN instance view)**.

Examples # Configure keepalive interval and holdtime interval as 60s and 180s.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] timer keepalive 60 hold 180
```

In BGP-VPN instance view, configure keepalive interval and holdtime interval as 60s and 180s (the VPN has been created).

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv4-family vpn-instance vpn1
[Sysname-bgp-vpn1] timer keepalive 60 hold 180
```

73 BGP DEBUGGING COMMANDS

debugging bgp all

Syntax **debugging bgp** [*ipv4-address* | *ipv6-address*] **all**

undo debugging bgp [*ipv4-address* | *ipv6-address*] **all**

View User view

Default Level 1: Monitor level

Parameters *ipv4-address*: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

Description Use the **debugging bgp all** command to enable all BGP debugging.

Use the **undo debugging bgp all** command to disable all BGP debugging.

By default, all BGP debugging is disabled.

Note the following:

- This command enables all BGP debugging, which may cause heavy traffic and affect system performance; therefore, use this command only when necessary.
- Disable debugging once the debugging operation is complete.

Examples # Enable all BGP debugging while Device A and Device B are establishing an IBGP peer relationship with each other.

```
[Sysname-bgp]display this
#
bgp 100
 undo synchronization
 peer 10.1.1.2 as-number 100
#
======================
[Sysname-bgp] display this
#
bgp 100
 undo synchronization
 peer 10.1.1.1 as-number 100
#
```

// BGP has established the peer relationship successfully.

*The display above is the debugging information shown by executing the **debugging bgp all** command on Device A. If the peer relationship between two devices cannot be established, you can compare the above debugging information with the actual debugging information to locate the fault. For detailed descriptions on the specific messages, refer to the commands below.*

debugging bgp detail

Syntax **debugging bgp detail**

undo debugging bgp detail

View User view

Default Level 1: Monitor level

Parameters None

Description Use the **debugging bgp detail** command to enable detailed debugging for BGP.

Use the **undo debugging bgp detail** command to disable detailed debugging for BGP.

Enabling debugging may affect system performance; therefore, use this command only when necessary. Disable debugging once the debugging operation is complete.

By default, detailed debugging for BGP is disabled.

Table 224 Description on the fields of the debugging bgp detail command

Field	Description
BGP.xxx	BGP instance name
BGP can't get physical interface index for destination:*X.X.X.X*	BGP cannot get the physical interface index for destination *X.X.X.X*.
Fail to search Token for destination *X.X.X.X*	Token search for destination *X.X.X.X* failed.
Allocate token failed. destination= *X.X.X.X*,LspmErr=*X*	Failed to allocate Token: destination *X.X.X.X*, LSP error code X
There are *XX* routes allocate token failed at this time before	Failed to allocate Tokens for XX routes
Recv UPDATE with following RD *XXX*	Received an Update message with RD XXX

Table 224 Description on the fields of the debugging bgp detail command

Field	Description
Received New VPNv4 Route with Ext-Community NULL.Ignoring Route	Received a new VPNv4 route with Ext-Community as NULL and therefore ignored the route.
Received VPNv4 Packet But No Such Route In Loc Rib	Received a VPNv4 packet and there is no such a route in the local routing table
operation XX	Label operation code
Receive SMB UP backup requirement	Received a standby board startup event requesting an active/standby switchover
Receive routine backup requirement	Received a routine request for an active/standby switchover
Receive SMB down backup requirement	Received a standby board down event requesting an active/standby switchover

Examples # Enable detailed debugging for BGP when a BGP peer relationship is being established.

```
<Sysname> debugging bgp detail
*Aug 24 14:12:13:674 2006 Sysname RM/6/RMDEBUG:
BGP_L3VPN: Recv UPDATE with following RD 100:1 destination 11.1.1.1
- Received New VPNv4 Route with Ext-Community NULL..Ignoring Route
```

// BGP received an UPDATE message with RD 100:1, destination address 11.1.1.1. The Ext-Community of the new VPNv4 route is NULL and therefore the route was ignored.

```
DeLocRemCross: Deleting route From Target Instance.
```

// The route was deleted from the instance

debugging bgp event

Syntax **debugging bgp** [*ipv4-address* | *ipv6-address*] **event**

undo debugging bgp [*ipv4-address* | *ipv6-address*] **event**

View User view

Default Level 1: Monitor level

Parameters *ipv4-address*: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

Description Use the **debugging bgp event** command to enable event debugging for BGP.

Use the **undo debugging bgp event** command to disable event debugging for BGP.

The **debugging bgp event** command is used to enable BGP event debugging, which is mainly related to events triggering the BGP state machine transitions.

After this debugging is enabled, information about all the BGP state machine transitions and the events triggering these transitions will be displayed. If no BGP peer relationship can be established, you can enable this debugging to locate the fault. Enabling debugging may affect system performance; therefore, use this command only when necessary and disable debugging once the debugging operation is complete.

By default, BGP event debugging is disabled.

Table 225 Description on the fields of the debugging bgp event command

Field	Description
Current event is *Eventname*	Name of the current event

Examples # Enable BGP event debugging when a BGP peer relationship is being established.

```
<Sysname> debugging bgp event
*Aug 24 14:12:13:674 2006 Sysname RM/6/RMDEBUG:

debugging bgp graceful-restart

Syntax **debugging bgp** [*ipv4-address* | *ipv6-address*] **graceful-restart**

undo debugging bgp [*ipv4-address* | *ipv6-address*] **graceful-restart**

View User view

Default Level 1: Monitor level

Parameters *ipv4-address*: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

Description Use the **debugging bgp graceful-restart** command to enable GR event debugging for BGP.

Use the **undo debugging bgp graceful-restart** command to disable GR event debugging for BGP.

After this debugging is enabled, the debugging information of the BGP GR operation will be displayed, including the currently triggered event, state transitions, receiving/sending of EOR messages, and peer IP address. If a fault occurs to the GR operation of BGP, you can display the debugging information for fault location.

Enabling debugging may affect system performance; therefore, use the command only when necessary and disable debugging once the debugging operation is complete.

By default, this debugging is disabled.

Examples # Enable BGP GR event debugging on the BGP GR Helper when the neighbor performs an active/standby switchover.

```
<Sysname> debugging bgp graceful-restart
%Aug 24 17:05:08:770 2006 Sysname RM/3/RMLOG:
 BGP.: 10.1.1.1 State is changed from ESTABLISHED to IDLE.
*Aug 24 17:05:08:786 2006 Sysname RM/6/RMDEBUG:
 BGP_GR: Peer 10.1.1.1 Gracefully Restarting
```

// The BGP neighbor 10.1.1.1 is performing GR.

```
%Aug 24 17:05:40:851 2006 Sysname RM/3/RMLOG:
 BGP.: 10.1.1.1 State is changed from OPENCONFIRM to ESTABLISHED.
```

// The BGP peer relationship has been successfully established.

```
*Aug 24 17:05:40:867 2006 Sysname RM/6/RMDEBUG:
 BGP_GR: Sent EOR to Peer 10.1.1.1 (IPv4-UNC)
```

//The BGP GR Helper finished sending initial routes and then sent an EOR message to peer 10.1.1.1.

```
*Aug 24 17:05:41:96 2006 Sysname RM/6/RMDEBUG:
 BGP_GR: Received EOR from Peer 10.1.1.1 (IPv4-UNC)
```

// The BGP GR Helper received an EOR message from peer 10.1.1.1.

debugging bgp

Syntax **debugging bgp** [*ipv4-address* | *ipv6-address*] { **keepalive** | **open** | **packet** | **raw-packet** | **route-refresh** } [**receive** | **send**] [**verbose**] }

undo debugging bgp [*ipv4-address* | *ipv6-address*] { **keepalive** | **open** | **packet** | **raw-packet** | **route-refresh** } [**receive** | **send**] [**verbose**] }

View User view

Default Level 1: Monitor level

Parameters *ipv4-address*: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

keepalive: Enables BGP Keepalive message debugging.

open: Enables BGP OPEN message debugging.

packet: Specifies to enable BGP packet debugging

raw-packet: Enables BGP raw packet debugging.

route-refresh: Enables BGP Route-Refresh message debugging.

receive: Enables the debugging for received BGP packets.

send: Enables the debugging for sent BGP packets.

verbose: Displays detailed debugging information.

Description Use the **debugging bgp** command to enable debugging for specific BGP message types.

Use the **undo debugging bgp** command to disable debugging for specific BGP message types.

Enabling debugging may affect system performance; therefore, use the command only when necessary and disable debugging once the debugging operation is complete.

By default, this debugging is disabled.

Table 226 Description on the fields of the debugging bgp command

Field	Description
Recv	Received packets
Send	Sent packets
Length: *LengthNumber*	Packet length

Table 227 Description on the fields of the debugging bgp open command

Field	Description
Version: *X*	BGP protocol version
Local AS: *X*	Local AS number
OPT Type: 2 (Capability)	Capability negotiation
CAP Type: 1 (Multiprotocol) CAP Len: 4	Multiprotocol capability: afi: 1; safi: 1
IPv4-UNC (1/1)	Capable of route-refresh
CAP Type: 2 (RouteRefresh) CAP Len: 0	
Total CAPB Len : *X*	Total capability length
Total OPT Len : *X*	Total optional parameter length

Table 228 Description on the fields of the debugging bgp refresh command

Field	Description
AFI/ SAFI	Address family/sub-address family
WTR	(When to Refresh) Wait delay for sending refresh messages

For details about UPDATE message debugging information, refer to the following section.

Examples # Display the debugging information about all the BGP messages received and sent, including Open, Keepalive, Update, and Route-refresh, while Device A and Device B are establishing a BGP peer relationship with each other.

```

// Device A received the BGP Route-refresh message, with a length of 23, address family of 1, sub-address family of 1, and *When to Refresh* of 0.

debugging bgp timer

Syntax **debugging bgp** [*ipv4-address* | *ipv6-address*] **timer**

undo debugging bgp [*ipv4-address* | *ipv6-address*] **timer**

View User view

Default Level 1: Monitor level

Parameters *ipv4-address*: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

Description Use the **debugging bgp timer** command to enable BGP timer debugging.

Use the **undo debugging bgp timer** command to disable BGP timer debugging.

By default, this debugging is disabled.

Enabling debugging may affect system performance; therefore, use the command only when necessary and disable debugging once the debugging operation is complete.

Table 229 Description on the fields of the debugging bgp timer command

Field	Description
CR Timer	Connection retry timer
HOLD Timer	Hold timer

Examples # Configure BGP on Device A and specify BGP peer 2.2.2.2 (Device B). On Device B which is connected to Device A, create no corresponding BGP peer. Enable BGP timer debugging on Device A.

```
<Sysname> debugging bgp timer
*0.92311078 Sysname RM/6/RMDEBUG:
 BGP_TIMER: CR Timer Expired for Peer 2.2.2.2
```

// The ConnectRetry timer for BGP peer 2.2.2.2 expired.

Configure BGP and specify a peer on Device B. The two devices establish a BGP peer relationship. Disable Device A from sending Keepalive messages to Device B. Then enable BGP timer debugging on Device B.

```
<Sysname> debugging bgp timer
*0.92311078 Sysname RM/6/RMDEBUG:
 BGP_TIMER: HOLD Timer Expired for Peer 2.2.2.2
```

// The hold timer expired on BGP peer 2.2.2.2.

debugging bgp update

Syntax **debugging bgp update** [**acl** *acl-number* | **ip-prefix** *ip-prefix-name*] [**receive** | **send**] [**verbose**]

undo debugging bgp update [**acl** *acl-number* | **ip-prefix** *ip-prefix-name*] [**receive** | **send**] [**verbose**]

View User view

Default Level 1: Monitor level

Parameters **acl** *acl-number:* Specifies an access control list (ACL) for filtering packet debugging information. The *acl-number* argument ranges from 2000 to 3999.

ip-prefix *ip-prefix-name*: Specifies an IP prefix list for filtering the packet debugging information. *ip-prefix-name* is a string of 1 to 19 characters.

receive: Enables the debugging for received BGP packets.

send: Enables the debugging for sent BGP packets.

verbose: Displays detailed debugging information.

Description Use the **debugging bgp update** command to enable debugging for BGP Update messages.

Use the **undo debugging bgp update** command to disable debugging for BGP Update messages.

By default, this debugging is disabled.

Enabling debugging may affect system performance; therefore, use this command only when necessary and disable debugging once the debugging operation is complete.

Table 230 Description on the fields of the debugging bgp update command

Field	Description
BGP.xxx	BGP instance name
Err/SubEr	Error code/error subcode
Errdata:	Error data
x.x.x.x/xx	Destination address/mask
RPM policy failed for policy :	Failed to pass policy xx
name:xx :	
INBOUND	Inbound policy
tnl id	Tunnel ID

Table 230 Description on the fields of the debugging bgp update command

Field	Description
afi = 196(l2vpn) safi = 128(l2vpn)	Address family is 196. Sub-address family is 128 (L2VPN).
afi = 155(vpls) safi = 128(vpls)	Address family is 155. Sub-address family is 128 (VPLS).

Examples For details, refer to the Update message debugging information for specific parameters.

debugging bgp update ipv4

Syntax **debugging bgp update ipv4** [**peer** { *ipv4-address* | *ipv4-group-name* } | **ip-prefix** *ip-prefix-name*] [**receive** | **send**] [**verbose**]

undo debugging bgp update ipv4 [**peer** { *ipv4-address* | *ipv4-group-name* } | **ip-prefix** *ip-prefix-name*] [**receive** | **send**] [**verbose**]

View User view

Default Level 1: Monitor level

Parameters **peer** { *ipv4-address* | *ipv4-group-name* }: Enables/disables BGP IPv4 update debugging for the specified IPv4 peer/peer group.

ip-prefix *ip-prefix-name*: Filters the output message debugging information with the specified IP prefix list.

receive: Enables/disables debugging for received BGP updates.

send: Enables/disables debugging for sent BGP updates.

verbose: Displays detailed debugging information.

Description Use the **debugging bgp update ipv4** command to enable debugging for BGP Update messages.

Use the **undo debugging bgp update ipv4** command to disable debugging for BGP Update messages.

By default, this debugging is disabled.

Enabling debugging may affect system performance; therefore, use this command only when necessary and disable debugging once the debugging operation is complete.

Examples # Device A and Device B have established an IPv4 peer relationship. Enable debugging for BGP Update messages.

// Update messages in an L2VPN environment

debugging bgp update label-route

Syntax **debugging bgp update label-route** [**peer** { *ipv4-address* | *group-name* }] [**acl** *acl-number* | **ip-prefix** *ip-prefix-name*] [**receive** | **send**] [**verbose**]

undo debugging bgp update label-route [**peer** { *ipv4-address* | *group-name* }] [**receive** | **send**] [**verbose**]

View User view

Default Level 1: Monitor level

Parameters **peer** { *ipv4-address* | *group-name* }: Enables/disables BGP labeled route update message debugging for the specified peer/peer group.

acl *acl-number*: Filters the output message debugging information with the specified ACL.

ip-prefix *ip-prefix-name*: Filters the output message debugging information with the specified address prefix.

receive: Enables/disables the debugging for received BGP labeled route update packets.

send: Enables/disables the debugging for sent BGP labeled route update packets.

verbose: Displays detailed debugging information.

Description

Use the **debugging bgp update label-route** command to enable debugging for BGP labeled route update messages.

Use the **undo debugging bgp update label-route** command to disable debugging for BGP labeled route update messages.

By default, this debugging is disabled.

Enabling debugging may affect system performance; therefore, use this command only when necessary and disable debugging once the debugging operation is complete.

Examples

Device A and Device B have established a BGP peer relationship and MPLS has been enabled on the connected interfaces. Enable debugging for BGP labeled route update messages.

```
<Sysname> debugging bgp update route-label
*Sep  4 16:14:32:16 2006 Sysname RM/6/RMDEBUG:
 BGP.: Send UPDATE to peer 2.2.2.2 for following destinations :

// Update message information of IPv6 labeled routes

debugging bgp update peer

Syntax **debugging bgp update peer** { *ipv4-address* | *group-name* } [**acl** *acl-number* | **ip-prefix** *ip-prefix-name*] [**receive** | **send**] [**verbose**]

undo debugging bgp update peer { *ipv4-address* | *group-name* } [**receive** | **send**] [**verbose**]

View User view

Default Level 1: Monitor level

Parameters *ipv4-address*: IPv4 peer address.

group-name: Peer group name.

acl *acl-number*: Filters the output message debugging information with the specified ACL.

ip-prefix *ip-prefix-name*: Filters the output message debugging information with the specified IP prefix list.

receive: Enables/disables the debugging for the received BGP packets.

send: Enables/disables the debugging for the sent BGP packets.

verbose: Displays detailed debugging information.

Description Use the **debugging bgp update peer** command to enable BGP update message debugging for the specified peer/peer group.

Use the **undo debugging bgp update peer** command to disable BGP Update message debugging for the specified peer/peer group.

By default, this debugging is disabled.

Enabling debugging may affect system performance; therefore, use this command only when necessary and disable debugging once the debugging operation is complete.

Examples For Update message debugging information in different networking environments, see the related commands.

debugging bgp update vpls

Syntax **debugging bgp update vpls** [**peer** { *ipv4-address* | *group-name* }] [**receive** | **send**] [**verbose**]

undo debugging bgp update vpls [**peer** { *ipv4-address* | *group-name* }] [**receive** | **send**] [**verbose**]

View User view

Default Level 1: Monitor level

Parameters **peer** { *ipv4-address* | *group-name* }: Enables/disables BGP VPLS update message debugging for the specified peer/peer group.

receive: Enables/disables the debugging for the received BGP packets.

send: Enables/disables the debugging for the sent BGP packets.

verbose: Displays detailed debugging information.

Description Use the **debugging bgp update vpls** command to enable debugging for BGP VPLS Update messages.

Use the **undo debugging bgp update vpls** command to disable debugging for BGP VPLS Update messages.

By default, this debugging is disabled.

Enabling debugging may affect system performance; therefore, use this command only when necessary and disable debugging once the debugging operation is complete.

Table 232 Description on the fields of the debugging bgp update vpls command

Field	Description
afi = 196(vpls) safi = 128(vpls)	Address family is 196. Sub-address family is 128 (VPLS).

Examples # In a VPLS environment, Device A and Device B have established a BGP peer relationship. Enable debugging for BGP VPLS update messages.

```
<Sysname> debugging bgp update vpls
*0.84372 Sysname RM/7/RMDEBUG:
         BGP.VPLS: Send UPDATE to 1.1.1.1 for following destinations :
         Origin       : IGP
         AS Path      : 200
         Next Hop     : 5.5.5.5
         afi = 155(vpls) safi = 128(vpls)
         Route Distinguisher:100:1
         CE-ID:1
         label offset:0
         label base:20480
```

// Information about the sent VPLS update message

```
*0.92566 Sysname RM/7/RMDEBUG:
         BGP.VPLS: Recv UPDATE from 1.1.1.1 with following destinations :
         Update message length : 88
         Origin       : IGP
         AS Path      : 100
         Next Hop     : 1.1.1.1
         afi = 155(vpls) safi = 128(vpls)
         Route Distinguisher:100:1
         CE-ID:0
         label offset:0
         label base:8192
```

// Information about the received VPLS update message

debugging bgp update vpn-instance

Syntax **debugging bgp update vpn-instance** *vpn-instance-name* [**ip-prefix** *ip-prefix-name* | **peer** { *ipv4-address* | *group-name* }] [**receive** | **send**] [**verbose**]

undo debugging bgp update vpn-instance *vpn-instance-name* [**ip-prefix** *ip-prefix-name* | **peer** { *ipv4-address* | *group-name* }] [**receive** | **send**] [**verbose**]

View User view

Default Level 1: Monitor level

Parameters *vpn-instance-name*: Enables/disables the BGP update message debugging for the specified VPN instance.

ip-prefix *ip-prefix-name*: Filters the output message debugging information with the specified IP prefix list.

peer { *ipv4-address* | *group-name* }: Enables/disables BGP update message debugging for the specified peer/peer group.

receive: Enables/disables the debugging for received BGP packets.

send: Enables/disables the debugging for the sent BGP packets.

verbose: Displays detailed debugging information.

Description Use the **debugging bgp update vpn-instance** command to enable update message debugging for a BGP VPN instance.

Use the **undo debugging bgp update instance** command to disable update message debugging for a BGP VPN instance.

By default, this debugging is disabled.

Enabling debugging may affect system performance; therefore, use this command only when necessary and disable debugging once the debugging operation is complete.

Refer to "debugging bgp update vpnv4" on page 1035 for the description of the update message information.

Examples None

debugging bgp update vpnv4

Syntax **debugging bgp update vpnv4** [**peer** { *ipv4-address* | *group-name* }] [**receive** | **send**] [**verbose**]

undo debugging bgp update vpnv4 [**peer** { *ipv4-address* | *group-name* }] [**receive** | **send**] [**verbose**]

View User view

Default Level 1: Monitor level

Parameters **peer** { *ipv4-address* | *group-name* }: Enables/disables BGP Update message debugging for the specified peer/peer group.

receive: Enables/disables the debugging for the received BGP VPNv4 packets.

send: Enables/disables the debugging for the sent BGP VPNv4 packets.

verbose: Displays detailed debugging information.

Description Use the **debugging bgp update vpnv4** command to enable debugging for BGP VPNv4 Update messages.

Use the **undo debugging bgp update vpnv4** command to disable debugging for BGP VPNv4 Update messages.

By default, this debugging is disabled.

Enabling debugging may affect system performance; therefore, use this command only when necessary and disable debugging once the debugging operation is complete.

Examples # Device A and Device B have established a BGP peer relationship under the VPNv4 instance. On Device A, enable debugging for received BGP VPNv4 update messages; on Device B, enable debugging for sent BGP VPNv4 update messages.

```
<Sysname> debugging bgp update vpnv4

74 IS-IS CONFIGURATION COMMANDS

area-authentication-mode

Syntax **area-authentication-mode** { **simple** | **md5** } *password* [**ip** | **osi**]

undo area-authentication-mode

View IS-IS view

Parameters **simple**: Specifies to send the password in plain text.

md5: Specifies to send the password encrypted with MD5.

password: Password to be set. For **simple** authentication mode, the *password* must be plain text. For **md5** authentication mode, the password can be either plain text or ciphertext. A plaintext password can be a string of up to 16 characters, such as **user918**. A cipher password must be a ciphertext string of up to 24 characters, such as **(TT8F]Y5SQ=^Q'MAF4<1!!**.

ip: Specifies the system to check the configuration for the corresponding field of IP in LSP.

osi: Specifies the system to check the configuration for the corresponding field of OSI in LSP.

*Whether a password should use **ip** or **osi** is not affected by the actual network environment.*

Description Use the **area-authentication-mode** command to configure the area authentication mode to insert the area authentication password into all the sent level-1 packets (LSP, CSNP, and PSNP) in the predefined way and verify the authentication password of the received level-1 pockets.

Use the **undo area-authentication-mode** command to restore the default.

By default, no area authentication mode is configured in the system; that is, the system authenticates no level-1 packets received and is configured with no password.

Configuring an area authentication mode can prevent the routing information learned by any untrusted routers from being added to the local LSDB.

Related commands: **reset isis all**, **domain-authentication-mode**, **isis authentication-mode**

Examples # Set the area authentication password to hello, and the authentication mode to simple.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] area-authentication-mode simple hello
```

auto cost enable

Syntax **auto-cost enable**

undo auto-cost enable

View IS-IS view

Parameters None

Description Use the **auto-cost enable** command to enable interfaces of the current IS-IS process to calculate interface cost automatically.

Use the **undo auto-cost enable** command to disable the function.

This function is disabled by default.

The preference of interface cost set by the **auto-cost** command is lower than that set by the **circuit-cost** command. The preference from high to low is: the cost set by the **isis cost** command, the global cost set by the **circuit cost** command, the cost automatically calculated and the default cost.

When the **cost-style** is **wide** or **wide-compatible**, the cost value of an interface is calculated by using the following formula:

cost = (reference value/bandwidth)×10.

Related commands: **bandwidth-reference (IS-IS view)**, **cost-style**.

Examples # Enable interfaces of IS-IS process 1 to calculate interface cost automatically.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] auto-cost enable
```

bandwidth-reference (IS-IS view)

Syntax **bandwidth-reference** *value*

undo bandwidth-reference

View IS-IS view

Parameters **value**: Bandwidth reference value in Mbps, ranging from 1 to 2147483648.

Description Use the **bandwidth-reference** command to set the bandwidth reference value for calculating link cost.

Use the **undo bandwidth-reference** command to restore the default.

By default, the reference value is 100 Mbps.

In the case no interface cost is specified in interface view or system view and automatic cost calculation is enabled:

- When the cost style is **wide** or **wide-compatible**, IS-IS automatically calculates the interface cost based on the interface bandwidth, using the formula: interface cost = bandwidth reference value/interface bandwidth, and the maximum calculated cost is 16777214.
- When the cost style is **narrow**, **narrow-compatible**, or **compatible**, if the interface is a loopback interface, the cost value is 0; otherwise, the cost value is automatically calculated as follows: if the interface bandwidth is in the range of 1 M to 10 M, the interface cost is 60; if the interface bandwidth is in the range of 11 M to 100 M, the interface cost is 50; if the interface bandwidth is in the range of 101 M to 155 M, the interface cost is 40; if the interface bandwidth is in the range of 156 M to 622 M, the interface cost is 30; if the interface bandwidth is in the range of 623 M to 2500 M, the interface cost is 20, and the default interface cost of 10 is used for any other bandwidths.

Related commands: **auto cost enable**.

Examples # Configure the bandwidth reference of IS-IS process 1 as 200 Mbps.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] bandwidth-reference 200
```

circuit-cost

Syntax **circuit-cost** *value* [**level-1** | **level-2**]

undo circuit-cost [**level-1** | **level-2**]

View IS-IS view

Parameters *value*: Specifies the global link cost value. The value range varies with cost types.

- For types **narrow, narrow-compatible** and **compatible**: The cost value ranges from 0 to 63.
- For types **wide** and **wide-compatible**: The cost value ranges from 0 to 16777215.

level-1: Applies the link cost to Level-1.

level-2: Applies the link cost to Level-2.

Description Use the **circuit-cost** command to set a global link cost.

Use the **undo circuit-cost** command to restore the default.

By default, the global link cost is not configured.

If no keyword is specified, the specified cost applies to Level-1-2.

The preference of interface cost from high to low is: the cost set by the **isis cost** command, the global cost set by the **circuit-cost** command, the cost automatically calculated (**auto-cost)** and the default cost.

Related commands: **isis cost**, **cost-style**.

Examples # Set the global Level-1 link cost of IS-IS process 1 to 11.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] circuit-cost 11 level-1
```

cost-style

Syntax **cost-style** { **narrow** | **wide** | **wide-compatible** | { **compatible** | **narrow-compatible** } [**relax-spf-limit**] }

undo cost-style

View IS-IS view

Parameters **narrow**: Specifies to receive and send only packets of narrow cost style (The narrow cost ranges from 0 to 63).

wide: Specifies to receive and send only packets of wide cost style (The wide cost ranges from 0 to 16777215).

compatible: Specifies to receive and send both wide and narrow style packets.

narrow-compatible: Specifies to receive both narrow and wide style packets, but send only narrow style packets.

wide-compatible: Specifies to receive both narrow and wide style packets, but send only wide style packets.

relax-spf-limit: Specifies to allow receiving routes with cost bigger than 1023. If this keyword is not configured, any route with cost bigger than 1023 will be discarded. This keyword is only available when keywords **compatible** and **narrow-compatible** are included.

Description Use the **cost-style** command to set the cost style of packets.

Use the **undo cost-style** command to restore the default.

Only packets of narrow cost style can be received and sent by default.

Related commands: **isis cost**.

Examples # Configure the router to send only packets of narrow cost style, but receive both narrow and wide cost style ones.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] cost-style narrow-compatible
```

default-route-advertise (IS-IS view)

Syntax **default-route-advertise** [**route-policy** *route-policy-name* | [**level-1** | **level-2** | **level-1-2**]] *

undo default-route-advertise [**route-policy** *route-policy-name*]

View IS-IS view

Parameters *route-policy-name*: Specifies the name of a routing policy, a string of 1 to 19 characters.

level-1: Specifies the level of the default route as Level-1.

level-2: Specifies the level of the default route as Level-2.

level-1-2: Specifies the level of the default route as Level-1-2.

If no level is specified, a Level-2 default route is generated.

Description Use the **default-route-advertise** command to generate a Level-1 or Level-2 default route.

Use the **undo default-route-advertise** command to disable the function.

This function is disabled by default.

The Level-1 default route is advertised to other routers in the same area, while the Level-2 default route is advertised to all the Level-2 and Level-1-2 routers.

Using the **apply isis level-1** command in routing policy view will generate a default route in L1 LSP. Using the **apply isis level-2** command in routing policy view will generate a default route in L2 LSP. Using the **apply isis level-1-2** command in routing policy view will generate a default route in L1 LSP and L2 LSP respectively.

Examples # Generate a default route in L2 LSP.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] default-route-advertise
```

display isis brief

Syntax **display isis brief** [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters *process-id*: IS-IS process ID, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies a VPN instance by its name, a string of 1 to 31 characters.

Description Use the **display isis brief** command to view brief IS-IS configuration information.

Examples # Display brief IS-IS configuration information.

```
<Sysname> display isis brief

                  ISIS 1 Protocol Brief Information :

network-entity:
    10.0000.0000.0001.00
is-level :level-1-2
cost-style:  narrow
preference :  15
Lsp-length receive :  1497
Lsp-length originate :  level-1 1497
                        level-2 1497
Timers:
    spf-slice-size:  0
    lsp-max-age:  1200
    lsp-refresh:  900
    Interval between SPFs:  10
```

Table 233 Description on the fields of the display isis brief command

Field	Description
network-entity	Network entity name
is-level	IS-IS Routing level
cost-style	Cost style
preference	Preference
Lsp-length receive	Maximum LSP that can be received
Lsp-length originate	Maximum LSP that can be generated
Timers	Timers
spf-slice-size	Time of each SPF calculation slice (0 means SPF calculation time is not split.)
lsp-max-age	Maximum life period of LSP

Table 233 Description on the fields of the display isis brief command

Field	Description
lsp-refresh	Refresh period of LSP
Interval between SPFs	Interval between SPF calculations

display isis debug-switches

Syntax **display isis debug-switches** { *process-id* | **vpn-instance** *vpn-instance-name* }

View Any view

Parameters *process-id*: Specifies the ID of an IS-IS process, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, a string of 1 to 31 characters.

Description Use the **display isis debug-switches** command to display the current IS-IS debugging state.

Examples # Display the debugging state of IS-IS process 1.

```
<Sysname> display isis debug-switches 1
IS-IS - Debug settings.
        IS-IS SPF Triggering Events debugging is on
```

display isis graceful-restart status

Syntax **display isis graceful-restart status** [**level-1** | **level-2**] [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters **level-1**: Displays the IS-IS Level-1 Graceful Restart state.

level-2: Displays the IS-IS Level-2 Graceful Restart state.

process-id: IS-IS Process ID, in the range 1 to 65535.

vpn-instance *vpn-instance-name*: Name of a VPN instance, a string of 1 to 31 characters.

Description Use the **display isis graceful-restart status** command to display IS-IS Graceful Restart status.

Examples # Display IS-IS Graceful Restart status.

```
<Sysname> display isis graceful-restart status
                Restart information for IS-IS(1)
--------------------------------------------------------------------
IS-IS(1) Level-1 Restart Status
```

```
Restart Interval: 150
SA Bit Supported
  Total Number of Interfaces = 1
  Restart Status: RESTARTING
  Number of LSPs Awaited: 3
  T3 Timer Status:
    Remaining Time: 239
  T2 Timer Status:
    Remaining Time: 59

IS-IS(1) Level-2 Restart Status
Restart Interval: 150
SA Bit Supported
  Total Number of Interfaces = 1
  Restart Status: RESTARTING
  Number of LSPs Awaited: 3
  T3 Timer Status:
    Remaining Time: 239
  T2 Timer Status:
Remaining Time: 59
```

Table 234 Description on the fields of the display isis graceful-restart status command

Field	Description
Restart Interval	Graceful Restart interval
SA Bit Supported	The SA bit is set
Total Number of Interfaces = 1	The current IS-IS interface number
Restart Status:	Graceful Restart status
T3 Timer Status	Remaining time of T3 timer
T2 Timer Status:	Remaining time of T2 Timer

display isis interface

Syntax **display isis interface** [[**traffic-eng** | **verbose**] * | **tunnel**] [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters **traffic-eng**: Displays IS-IS traffic engineering information.

verbose: Displays IS-IS interface detail information.

tunnel: Displays IS-IS tunnel information.

process-id: IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: VPN instance name, a string of 1 to 31 characters.

Description Use the **display isis interface** command to view IS-IS enabled interface information.

The information displayed by this command includes interface name, interface IP address, interface link state and so on. Besides all the information displayed by

display isis interface, using the **display isis interface verbose** command displays other interface related information, such as CSNP packets broadcast intervals, Hello packets broadcast intervals and the number of invalid Hello packets.

Examples # Display IS-IS enabled interface information.

```
<Sysname> display isis interface
                       Interface information for ISIS(1)
                       --------------------------------
Interface: Ethernet1/0
Id      IPV4.State        IPV6.State     MTU    Type    DIS
001       Up                Down       1497    L1/L2   No/No
```

Display detailed IS-IS interface information.

```
<Sysname> display isis interface verbose
                       Interface information for ISIS(1)
                       --------------------------------
Interface: Ethernet1/0
Id     IPV4.State             IPV6.State        MTU    Type    DIS
001        Up                      Down         1497   L1/L2   No/No

Table 235 Description on the fields of the display isis interface command

Field	Description
Interface	Interface
Id	Circuit ID
IPV4.State	IPv4 state
IPV6.State	IPv6 state
MTU	Interface MTU
Type	Interface link type
DIS	Designated IS
SNPA Address	Subnet access point address
IP Address	Primary IP address
Secondary IP Address(es)	Secondary IP addresses
IPV6 Link Local Address	IPv6 link local address
IPV6 Global Address(es)	IPv6 global address
Csnp Timer Value	Interval for sending CSNP packets
Hello Timer Value	Interval for sending Hello packets

Table 235 Description on the fields of the display isis interface command

Field	Description
Hello Multiplier Value	Number of invalid Hello packets
Lsp Timer Value	Interval for sending LSP packets
Cost	Cost
Priority	Preference
Retransmit Timer Value	LSP retransmission interval over point-to-point link
BFD	Whether BFD is enabled

display isis license

Syntax **display isis license**

View Any view

Parameters None

Description Use the **display isis license** command to display the information of the IS-IS license.

Examples # Display the information of the IS-IS license.

```
[Sysname] display isis license

                     ISIS Shell License Values
                     _________________________

 Feature Name         Active     Controllable

```

Table 236 Description on the fields of the display isis license command

Field	Description
ISIS Shell License Values	License values of ISIS shell
Feature Name	Feature name
Active	Whether the state is active.
Controllable	Whether support reading configuration through License file.
ISIS Protocol	IS-IS Protocol
IPV6	Whether IPv6 is active or not.
RESTART	Graceful Restart (GR)
TE	Traffic Engineering
MI	Multi-instance
Resource Name	Resource name
MinVal	Minimum value
MaxVal	Maximum value
CurrVal	Current value
ISIS Core License Values	License values of ISIS Core
Max Processes Resource	Maximum number of processes supported
Max Paths Resource	Maximum equal cost paths
Max IPv4 Rt Resource	Maximum IPv4 routes supported
Max IPv6 Rt Resource	Maximum IPv6 routes supported

The license information varies with device models.

display isis lsdb

Syntax **display isis lsdb** [[**l1** | **l2** | **level-1** | **level-2**] | [**lsp-id** *LSPID* | **lsp-name** *lspname*] | **local** | **verbose**] * [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters **l1**, **level-1**: Specifies level-1 LSDB.

l2, **level-2**: Specifies level-2 LSDB.

LSPID: LSP ID, in the form of sysid. Pseudo ID-fragment num.

lspname: LSP name, in the form of Symbolic name.[Pseudo ID]-fragment num.

local: Displays LSP information generated locally.

verbose: Displays LSDB detailed information.

process-id: IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, a string of 1 to 31 characters.

If no level is specified, then both Level-1 and Level-2 (or Level-1-2) link state databases are displayed by default.

Description Use the **display isis lsdb** command to display IS-IS link state database.

Examples # Display Level-1 LSDB information.

```
<Sysname> dis isis lsdb level-1

                        Database information for ISIS(1)
                        --------------------------------

                          Level-1 Link State Database

LSPID                     Seq Num      Checksum      Holdtime      Length  ATT/P/OL
-------------------------------------------------------------------------------
bbbb.cccc.dddd.00-00* 0x0000001d 0x165        820           36     1/0/0

    *-Self LSP, +-Self LSP(Extended), ATT-Attached, P-Partition, OL-Overload
```

Table 237 Description on the fields of the display isis lsdb command

Field	Description
LSPID	Link state packet ID
Seq Num	LSP sequence number
Checksum	LSP checksum
Holdtime	LSP holdtime
Length	LSP length
ATT/P/OL	Attach bit (ATT)
	Partition bit (P)
	Overload bit (OL)

display isis mesh-group

Syntax **display isis mesh-group** [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters *process-id*: Specifies an IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, in the range of 1 to 31 characters.

Description Use the **display isis mesh-group** command to display IS-IS mesh-group.

Examples # Add the Serial2/0 interface and Serial2/1 interface on a router to mesh-group 100.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis mesh-group 100
[Sysname-Serial2/0] quit
[Sysname] interface serial 2/1
[Sysname-Serial2/1] isis mesh-group 100
```

Display the configuration information of IS-IS mesh-group.

```
[Sysname-Serial2/1] display isis mesh-group
              Mesh Group information for ISIS(1)
-------------------------------------------------------------------------
Interface          Status
Serial2/0         100
Serial2/1         100
```

display isis name-table

Syntax **display isis name-table** [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters *process-id*: IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: VPN instance name, in the range of 1 to 31 characters.

Description Use the **display isis name-table** command to display the host name-to-system ID mapping table.

Examples # Configure a name for the local IS-IS system.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] is-name RUTA
```

Configure a static mapping for the remote IS-IS system (0000.0000.0041).

```
[Sysname-isis-1] is-name map 0000.0000.0041 RUTB
```

Display the IS-IS host name-to-system ID mapping table.

```
[Sysname-isis-1] display isis name-table
              Name table information for ISIS(1)
-------------------------------------------------------------
System ID            Hostname                          Type
6789.0000.0001       RUTA                              DYNAMIC
0000.0000.0041       RUTB                              STATIC
```

Table 238 Description on the fields of the display isis name-table command

Field	Description
System ID	System ID
Hostname	Hostname name of the system ID
Type	Mapping type of system ID to host name (static or dynamic)

display isis peer

Syntax **display isis peer** [**verbose**] [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters **verbose**: When this parameter is used, the area address advertised in a neighbor's Hello packet will be displayed. Otherwise the system displays only the summary information.

process-id: Specifies an IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, in the range of 1 to 31 characters.

Description Use the **display isis peer** command to display IS-IS neighbor information.

Besides all the information displayed using the **display isis peer** command, the **display isis peer verbose** command displays neighbor area address, hold time of Up state and direct interface's IP address.

Examples # Display detailed IS-IS neighbor information.

```
<Sysname> display isis peer verbose
                          Peer information for ISIS(1)
                          ----------------------------
System Id: 0000.0000.0003
Interface: Ethernet1/0           Circuit Id: 0000.0000.0003.01
State: Up  HoldTime: 8s          Type: L1(L1L2)        PRI: 64
Area Address(es):10
Peer IP Address(es): 192.168.0.3
Uptime: 00:14:03
Adj Protocol:  IPV4
```

Table 239 Description on the fields of the display isis peer command

Field	Description
System Id	System ID
Interface	Interface connecting to the neighbor
Circuit Id	Circuit ID
State	State
HoldTime	Holdtime
Type	Type of the neighbor
PRI	DIS Priority
Area Address(es)	The neighbor's area address
Peer IP Address(es)	Interface IP address of the neighbor
Uptime	Time being up
Adj Protocol	Adjacency protocol

display isis route

Syntax **display isis route** [**ipv4**] [[**level-1** | **level-2**] | **verbose**] * [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters **ipv4**: Displays IS-IS IPv4 routing information (the default).

verbose: Displays IS-IS detailed IPv4 routing information.

process-id: Specifies an IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, in the range of 1 to 31 characters.

level-1: Displays Level-1 IS-IS routes.

level-2: Displays Level-2 IS-IS routes.

If no level is specified, then both Level-1 and Level-2 (Level-1-2) routing information will be displayed.

Description Use the **display isis route** command to display IS-IS IPv4 routing information.

Examples # Display IS-IS IPv4 routing information

```
<Sysname> display isis route
                        Route information for ISIS(1)
                        -----------------------------

                     ISIS(1) IPv4 Level-1 Forwarding Table
                     -------------------------------------

 IPV4 Destination     IntCost    ExtCost ExitInterface   NextHop         Flags
--------------------------------------------------------------------------------
------------------------------
 12.12.12.0/24        10         NULL    Eth0/1/0        Direct          D/L/-
 24.24.24.0/24        20         NULL    Eth0/1/0        12.12.12.2      R/L/-
 2.2.2.2/32           10         NULL    Eth0/1/0        12.12.12.2      R/L/-
 2.2.3.2/32           10         NULL    Eth0/1/0        12.12.12.2      R/L/-

      Flags: D-Direct, R-Added to RM, L-Advertised in LSPs, U-Up/Down Bit Set

                     ISIS(1) IPv4 Level-2 Forwarding Table
                     -------------------------------------

 IPV4 Destination     IntCost    ExtCost ExitInterface   NextHop         Flags
--------------------------------------------------------------------------------
------------------------------
 12.12.12.0/24        10         NULL    Eth0/1/0        Direct          D/L/-
 24.24.24.0/24       20        NULL
 2.2.2.2/32          10        NULL
 2.2.3.2/32          10        NULL

      Flags: D-Direct, R-Added to RM, L-Advertised in LSPs, U-Up/Down Bit Set
```

Table 240 Description on the fields of the display isis route command

Field	Description
IPV4 Destination	IPv4 destination address
IntCost	Interior routing cost
ExtCost	Exterior routing cost
ExitInterface	Exit interface
NextHop	Next hop

Table 240 Description on the fields of the display isis route command

Field	Description
Flags	Routing state flag
	D: Direct route.
	R: The route has been added into the routing table.
	L: The route has been broadcast.
	U: A route's penetration flag. Setting it to UP can prevent an LSP sent from L2 to L1 from being sent back to L2.

display isis spf-log

Syntax **display isis spf-log** [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters *process-id*: Specifies an IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, a string of 1 to 31 characters.

Description Use the **display isis spf-log** command to display IS-IS SPF log record.

Examples # Display IS-IS SPF log record.

```
<Sysname> display isis spf-log
                       SPF Log information for ISIS(1)
                       -------------------------------
   Level    Trig.Event                      No.Nodes  Duration   StartTime
   L2       IS_SPFTRIG_PERIODIC             2         0          13:3:24
   L1       IS_SPFTRIG_PERIODIC             2         0          13:18:8
   L2       IS_SPFTRIG_PERIODIC             2         0          13:18:8

   L2       IS_SPFTRIG_PERIODIC             2         0          12:35:24
   L1       IS_SPFTRIG_PERIODIC             2         0          12:49:24
   L2       IS_SPFTRIG_PERIODIC             2         0          12:49:24
   L1       IS_SPFTRIG_PERIODIC             2         0          13:3:24
```

Table 241 Description on the fields of the display isis spf-log command

Field	Description
Level	SPF calculation level
Trig.Event	SPF triggered event
No.Nodes	Number of SPF calculation nodes

Table 241 Description on the fields of the display isis spf-log command

Field	Description
Duration	SPF calculation duration
StartTime	SPF calculation start time

display isis statistics

Syntax **display isis statistics** [**level-1** | **level-2** | **level-1-2**] [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters **level-1**: IS-IS Level-1 statistic information.

level-2: IS-IS Level-2 statistic information.

level-1-2: IS-IS Level-1-2 statistic information.

process-id: Specifies an IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, a string of 1 to 31 characters.

Description Use the **display isis statistics** command to display the statistic information of IS-IS process, including the number of routes learned from other IS-IS routers, the number of routes redistributed from other protocols and the number of LSP generated locally.

Examples # Display IS-IS statistic information.

```
<Sysname> display isis statistics

                      Statistics information for ISIS(1)
                      ----------------------------------

                             Level-1 Statistics
                             ------------------

Learnt routes information:
         Total IPv4 Learnt Destinations: 4
         Total IPv6 Learnt Destinations: 0

Imported routes information:
         IPv4 Imported Routes:
                         Static: 0       Direct: 0
                         ISIS:   0       BGP:    0
                         RIP:    0       OSPF:   0
         IPv6 Imported Routes:
                         Static: 0       Direct: 0
                         ISISv6: 0       BGP4+:  0
                         RIPng:  0       OSPFv3: 0

Lsp information:
```

```
                    LSP Source ID:          No. of used LSPs
                    0000.0000.0002                  001
```

Table 242 Description on the fields of the display isis statistics command

Field		Description
Statistics information for ISIS(*processid*)		Statistics for the ISIS process
Level-1 Statistics		Level-1 Statistics
Level-2 Statistics		Level-2 Statistics
Learnt routes information		Number of learnt IPv4 routes Number of learnt IPv6 routes
Imported routes information	IPv4 Imported Routes	Redistributed IPv4 routes ■ Static ■ Direct ■ ISIS ■ BGP ■ RIP ■ OSPF
	IPv6 Imported Routes	Redistributed IPv6 routes ■ Static ■ Direct ■ ISISv6 ■ BGP4+ ■ RIPng ■ OSPFv3
Lsp information		LSP information ■ LSP Source ID: ID of the source system ■ No. of used LSPs: number of used LSPs

domain-authentication-mode

Syntax **domain-authentication-mode** { **simple** | **md5** } *password* [**ip** | **osi**]

undo domain-authentication-mode

View IS-IS view

Parameters **simple**: Specifies to send the password in plain text.

md5: Specifies to send the password encrypted with MD5.

password: Specifies a password. For **simple** authentication mode, the *password* must be plain text. For **md5** authentication mode, the password can be either plain text or cipher text. A plain text password is a string of up to 16 characters, such as **user918**. A cipher password must be a string of 24 characters, such as **_(TT8F]Y5SQ=^Q'MAF4<1!!**.

ip: Specifies to check the IP related fields in a LSP.

osi: Specifies to check the OSI related fields in a LSP.

Whether a password should use **ip** or **osi** is not affected by the actual network environment.

Description Use the **domain-authentication-mode** command to configure the routing domain authentication mode to insert the area authentication password into all the sent level-2 packets (LSP, CSNP, and PSNP) in the predefined way and verify the authentication password of the received level-2 pockets.

Use the **undo domain-authentication-mode** command to cancel the routing domain authentication mode configuration.

By default, no routing domain authentication mode is configured in the system; that is, the system authenticates no level-2 packets received and is configured with no password.

Related commands: **area-authentication-mode**, **isis authentication-mode**.

Examples # Use the simple mode and password "123456" to authenticate level-2 routing packets.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] domain-authentication-mode simple 123456
```

filter-policy export (IS-IS view)

Syntax **filter-policy** { *acl-number* | **ip-prefix** *ip-prefix-name* | **route-policy** *route-policy-name* } **export** [**isis** *process-id* | **ospf** *process-id* | **rip** *process-id* | **bgp** | **direct** | **static**]

undo filter-policy export [**isis** *process-id* | **ospf** *process-id* | **rip** *process-id* | **bgp** | **direct** | **static**]

View IS-IS view

Parameters *acl-number*: Specifies the number of an ACL that is used to filter outgoing redistributed routes, ranging from 2000 to 3999.

ip-prefix *ip-prefix-name*: Specifies the name of an IP prefix list that is used to filter outgoing redistributed routes, a string of 1 to 19 characters.

route-policy *route-policy-name*: Specifies the name of a routing policy that is used to filter outgoing redistributed routes, a string of 1 to 19 characters.

isis *process-id*: Filters outgoing routes redistributed from an IS-IS process. The process ID is in the range of 1 to 65535.

ospf *process-id*: Filters outgoing routes redistributed from an OSPF process. The process ID is in the range of 1 to 65535.

rip *process-id*: Filters outgoing routes redistributed from a RIP process. The process ID is in the range of 1 to 65535.

bgp: Filters outgoing routes redistributed from BGP.

direct: Filters outgoing redistributed **direct** routes.

static: Filters outgoing redistributed **static** routes.

If no parameter is specified, the system will filter all outgoing redistributed routing information.

Description Use the **filter-policy export** command to configure IS-IS to filter outgoing redistributed routes.

Use the **undo filter-policy export** command to disable IS-IS from filtering outgoing redistributed routes.

IS-IS does not filter outgoing redistributed routes by default.

In some cases, only redistributed routing information satisfying certain conditions can be advertised. You can use the **filter-policy** command to reference filtering conditions.

Related commands: **filter-policy import (IS-IS view)**.

Examples # Reference ACL 2000 to filter outgoing redistributed routes.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] filter-policy 2000 export
```

filter-policy import (IS-IS view)

Syntax **filter-policy** { *acl-number* | **ip-prefix** *ip-prefix-name* | **route-policy** *route-policy-name* } **import**

undo filter-policy import

View IS-IS view

Parameters *acl-number*: Specifies the number of an ACL that is used to filter incoming routes, ranging from 2000 to 3999.

ip-prefix *ip-prefix-name*: Specifies the name of an IP prefix list that is used to filter incoming routes, a string of 1 to 19 characters.

route-policy *route-policy-name*: Specifies the name of a routing policy that is used to filter incoming routes, a string of 1 to 19 characters.

Description Use the **filter-policy import** command to configure IS-IS to filter incoming routing information.

Use the **undo filter-policy import** command to disable IS-IS from filtering incoming routing information.

IS-IS does not filter incoming routing information by default.

In some cases, only the routing information satisfying certain conditions can be received. You can reference filtering conditions using the **filter-policy** command.

Related commands: **filter-policy export (IS-IS view)**.

Examples # Reference ACL 2000 to filter incoming routing information.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] filter-policy 2000 import
```

flash-flood

Syntax **flash-flood** [**flood-count** *flooding-count* | **max-timer-interval** *flooding-interval* | [**level-1** | **level-2**]] *

undo flash-flood [**level-1** | **level-2**]

View IS-IS view

Parameters **flood-count** *flooding-count*: Specifies the maximum number of LSPs to be sent in the fast-flooding process, ranging from 1 to 15. The default is 5.

max-timer-interval *flooding-interval*: Specifies the delay interval (in milliseconds) between when it is enabled and when it begins, ranging from 10 to 50000. The default is 10.

level-1: Specifies to configure fast-flooding on **level-1** only.

level-2: Specifies to configure fast-flooding on **level-2** only. If no level is configured, the fast-flooding will be available on both **level-1** and **level-2** by default.

Description Use the **flash-flood** command to enable IS-IS LSP fast flooding and configure related parameters, including the maximum number of LSPs to be sent and the delay time before flooding.

Use the **undo flash-flood** command to disable fast-flooding.

Fast flooding is disabled by default.

Using this command can speed up LSP flooding that is triggered by topology changes, so as to reduce LSDB convergence time.

Examples # Enable fast flooding and configure the maximum LSPs be sent as 10 and the delay time as 100 milliseconds.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] flash-flood flood-count 10 max-timer-interval 100
```

graceful-restart (IS-IS view)

Syntax **graceful-restart**

undo graceful-restart

View IS-IS view

Parameters None

Description Use the **graceful-restart** command to enable the IS-IS Graceful Restart capability.

Use the **undo graceful-restart** command to disable the IS-IS Graceful Restart capability.

By default, IS-IS Graceful Restart capability is disabled.

Examples # Enable the Graceful Restart capability for IS-IS process 1.

```
<Sysname> system-view
[Sysname] isis 1
[Sysname-isis-1] graceful-restart
```

graceful-restart interval (IS-IS view)

Syntax **graceful-restart interval** *interval-value*

undo graceful-restart interval

View IS-IS view

Parameters *interval-value*: Graceful Restart interval, in the range 30 to 1800 seconds.

Description Use the **graceful-restart interval** command to configure the Graceful Restart interval.

Use the **undo graceful-restart interval** command to restore the default Graceful Restart interval.

By default, the Graceful Restart interval is 300 seconds.

Examples # Configure the Graceful Restart interval for IS-IS process 1 as 120 seconds.

```
<Sysname> system-view
[Sysname] isis 1
[Sysname-isis-1] graceful-restart interval 120
```

graceful-restart suppress-sa

Syntax **graceful-restart suppress-sa**

undo graceful-restart suppress-sa

View IS-IS view

Parameters None

Description Use the **graceful-restart suppress-sa** command to set the SA (Suppress-Advertisement) bit during restart.

Use the **undo graceful-restart suppress-sa** command to clear the SA bit during restart.

By default, the SA bit is cleared during restart.

Note that:

- A router that starts at the first time does not maintain the forwarding state. For a router that restarts IS-IS, copies of LSPs generated by this router during the previous incarnation may still exist in the lSP databases of other routers in the network.
- Copies of LSPs in the LSP databases in other routers which may look "newer" than LSPs generated by the restarting router after it initializes LSP fragment sequence numbers. This may result in temporary blackholes until subsequent LSPs with higher sequence numbers are regenerated.
- These blackholes can be avoided if the neighbors suppress advertising the previous adjacencies to the restarting router until the latter has flooded LSPs with higher sequence numbers.

Examples # Set the SA bit during Graceful Restart.

```
<Sysname> system-view
[Sysname] isis 1
[Sysname-isis-1] graceful-restart suppress-sa
```

import-route (IS-IS view)

Syntax **import-route** { **isis** [*process-id*] | **ospf** [*process-id*] | **rip** [*process-id*] | **bgp** [**allow-ibgp**] | **direct** | **static** } [**cost** *cost* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

undo import-route { **isis** [*process-id*] | **ospf** [*process-id*] | **rip** [*process-id*] | **bgp** | **direct** | **static** }

View IS-IS view

Parameters **isis** [*process-id*]: Redistributes routes from a specified ISIS process. *process-id* is in the range of 1 to 65535.

ospf [*process-id*]: Redistributes routes from a specified OSPF process. *process-id* is in the range of 1 to 65535.

rip [*process-id*]: Redistributes routes from a specified RIP process. *process-id* is in the range of 1 to 65535.

bgp: Redistributes BGP routes.

allow-ibgp: Redistributes IBGP routes.

direct: Redistributes direct routes.

static: Redistributes static routes.

cost: Specifies a cost for redistributed routes.

The range of the cost depends on it type:

- For the types of narrow, narrow-compatible and compatible, the cost ranges from 0 to 63.
- For the types of wide, wide-compatible, the cost ranges from 0 to 16777215.

cost-type { **external** | **internal** }: Specifies a cost type. The **internal** type indicates the cost of routes within an area; the **external** type indicates the cost of routes between areas. The type is **external** by default. The keywords are valid only when the cost type is narrow, narrow-compatible or compatible.

level-1: Redistributes routes into the Level-1 routing table.

level-2: Redistributes routes into the Level-2 routing table. If no level is specified, the routes are redistributed into the Level-2 routing table by default.

level-1-2: Redistributes routes into both Level-1 and Level-2 routing tables.

route-policy *route-policy-name*: Redistributes only routes satisfying the matching conditions of a routing policy, the name of which is a string of 1 to 19 characters.

tag *tag*: Specifies a tag value for redistributed routes from 1 to 4294967295.

Description Use the **import-route** command to redistribute routes from other protocols.

Use the **undo import-route** command to disable route redistribution.

Route redistribution is not available by default.

IS-IS takes all the redistributed routes as external routes to destinations outside the IS-IS routing domain.

Related commands: **import-route isis level-2 into level-1**.

Using the import-route bgp command redistributes only EBGP routes. Using the import-route bgp allow-ibgp command redistributes also IBGP routes, but this may cause routing loops. Be cautious with this command.

Examples # Redistribute static routes and set the cost to 15.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] import-route static cost 15
```

import-route isis level-2 into level-1

Syntax **import-route isis level-2 into level-1** [**filter-policy** { *acl-number* | **ip-prefix** *ip-prefix-name* | **route-policy** *route-policy-name* } | **tag** *tag*] *

undo import-route isis level-2 into level-1

View IS-IS view

Parameters *acl-number*: Specifies the number of an ACL that is used to filter redistributed routes, ranging from 2000 to 3999.

ip-prefix *ip-prefix-name*: Specifies the name of an IP prefix list that is used to filter redistributed routes, a string of 1 to 19 characters.

route-policy *route-policy-name*: Specifies the name of a routing policy that is used to filter redistributed routes, a string of 1 to 19 characters.

tag *tag*: Specifies a tag value from 1 to 4294967295 for redistributed routes.

Description Use the **import-route isis level-2 into level-1** command to redistribute routes from Level-2 to Level-1area.

Use the **undo import-route isis level-2 into level-1** command to disable this redistribution.

The redistribution is not available by default.

Note that:

- You can specify a routing policy in the **import-route isis level-2 into level-1** command to filter routes from Level-2 to Level-1. Other routing policies specified for route reception and redistribution does not affect the route leaking.
- If a filter policy is configured, only routes passing it can be advertised into the Level-1 area.

Related commands: **import-route (IS-IS view)**.

Examples # Configure the router to redistribute routes from Level-2 to Level-1.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] import-route isis level-2 into level-1
```

isis

Syntax **isis** [*process-id*] [**vpn-instance** *vpn-instance-name*]

undo isis [*process-id*]

View System view

Parameters *process-id*: Process ID, ranging from 1 to 65535. The default is 1.

vpn-instance-name: VPN instance name, a string of 1 to 31 characters.

Description Use the **isis** command to enable an IS-IS process and an associated VPN instance and enter IS-IS view.

To run IS-IS, you must first use the **isis** command to enable an IS-IS process, then use the **network-entity** command to configure a Network Entity Title (NET) for the router, and then use the **isis enable** command to enable IS-IS on each interface that needs to run the IS-IS process.

Related commands: **isis enable**, **network-entity**.

Examples # Enable IS-IS routing process 1, with the system ID being 0000.0000.0002, and area ID being 01.0001.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] network-entity 01.0001.0000.0000.0002.00
```

isis authentication-mode

Syntax **isis authentication-mode** { **simple** | **md5** } *password* [**level-1** | **level-2**] [**ip** | **osi**]

undo isis authentication-mode [**level-1** | **level-2**]

View Interface view

Parameters **simple**: Specifies to send the password in plain text.

md5: Specifies to send the password in ciphertext.

password: Specifies a password. For **simple** authentication mode, the *password* must be plain text. For **md5** authentication mode, the password can be either plain text or ciphertext. A plain text password can be a string of up to 16 characters, such as **user918**. A cipher password must be a string of 24 characters, such as **_(TT8F]Y5SQ=^Q'MAF4<1!!**.

level-1: Specifies to set the password for Level-1.

level-2: Specifies to set the password for Level-2.

ip: Specifies the system to check IP related fields in a LSP.

osi: Specifies the system to check OSI related fields in a LSP.

Whether a password should use **ip** or **osi** is not affected by the actual network environment.

This command is not available in loopback interface view.

Description Use the **isis authentication-mode** command to set the IS-IS authentication mode and password for an interface.

Use the **undo isis authentication-mode** command to disable the authentication and remove the password.

There is no password or authentication by default.

If you set a password without specifying any other parameter, the password applies to both Level-1 and Level-2, and the system checks the OSI related fields in a LSP.

Related commands: **area-authentication-mode**, **domain-authentication-mode**.

*The level-1 and level-2 keywords are supported only on an Ethernet or GigabitEthernet interface of a router. Before using the command with the keywords, you need use the **isis enable** command to enable IS-IS on the interface.*

Examples # Set the plain text password easykey for the Serial2/0 interface.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis authentication-mode simple easykey
```

isis circuit-level

Syntax **isis circuit-level** [**level-1** | **level-1-2** | **level-2**]

undo isis circuit-level

View Interface view

Parameters **level-1**: Specifies to set up only level-1 adjacency on the interface.

level-1-2: Specifies to set up level-1-2 adjacency on the interface.

level-2: Specifies to set up only level-2 adjacency on the interface.

Description Use the **isis circuit-level** command to configure link adjacency level for an interface of a level-1-2 router.

Use the **undo isis circuit-level** command to restore the default.

An interface can establish level-1-2 adjacency by default.

This command is only available on a level-1-2 router. You can use it to configure an interface to establish the adjacency of a specified level (**level-1** or **level-2**) with the neighbor, making the interface handle only the specified level hello packets. An interface can receive and send only one level hello packet on a point-to-point link. Using this command can reduce the router's processing time and save bandwidth.

Related commands: **is-level**.

Examples # Suppose serial 2/0 is connected to a non backbone router in the same area. Configure the link adjacency level of serial 2/0 as Level-1 to prevent sending and receiving Level-2 Hello packets.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis enable
[Sysname-Serial2/0] isis circuit-level level-1
```

isis circuit-type

Syntax **isis circuit-type p2p**

undo isis circuit-type

View Interface view

Parameters **p2p**: Specifies the interface's network type as P2P.

Description Use the **isis circuit-type** command to configure the network type for an interface.

Use the **undo isis circuit-type** command to restore the default.

By default, the network type of a router's interface depends on the physical media.

This command is not available in the loopback interface view.

Examples # Configure the network type of the Ethernet1/0 interface as P2P.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] isis enable
[Sysname-Ethernet1/0] isis circuit-type p2p
```

isis cost

Syntax **isis cost** *value* [**level-1** | **level-2**]

undo isis cost [**level-1** | **level-2**]

View Interface view

Parameters *value*: Specifies a cost for SPF calculation on a specified level. The default is 10. The range of cost value differs according to different cost types.

- For types **narrow**, **narrow-compatible** and **compatible**: The cost value ranges from 1 to 63.
- For types **wide** and **wide-compatible**: The cost value ranges from 1 to 16777215.

level-1: Applies the cost to Level-1.

level-2: Applies the cost to Level-2.

Description Use the **isis cost** command to set the link cost of an interface for SPF calculation.

Use the **undo isis cost** command to restore the default.

No cost is configured by default.

If neither **level-1** nor **level-2** is included, the cost applies to both **level-1** and **level-2**.

You are recommended to configure a proper link cost for each interface for optimal route selection.

Relate command: **circuit-cost**.

Examples # Configure the Level-2 link cost as 5 for Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis cost 5 level-2
```

isis dis-name

Syntax **isis dis-name** *symbolic-name*

undo isis dis-name

View Interface view

Parameters *symbolic-name*: Specifies a name for the local LAN, a string of 1 to 64 characters.

Description Use the **isis dis-name** command to configure a name for local LAN. If the local router is the DIS, the name will be advertised in a pseudonode LSP packet.

Use the **undo isis dis-name** command to disable this function.

No name is configured by default.

Note that this command takes effect only on a router with the dynamic hostname process enabled. This command is not supported on a Point-to-Point interface.

This command is not available in the loopback interface view.

Examples # Configure the name as "LOCALAREA" for the local LAN.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] isis dis-name LOCALAREA
```

isis dis-priority

Syntax **isis dis-priority** *value* [**level-1** | **level-2**]

undo isis dis-priority [**level-1** | **level-2**]

View Interface view

Parameters *value*: Specifies a priority for DIS selection from 0 to 127. The default is 64.

level-1: Applies the DIS selection priority to Level-1.

level-2: Applies the DIS selection priority to level-2.

If neither level-1 nor level-2 is specified in this command, the DIS priority applies to both Level-1 and Level-2.

Description Use the **isis dis-priority** command to specify a DIS selection priority on a specified level for an interface.

Use the **undo isis dis-priority** command to restore the default priority of 64.

There is no backup DIS in IS-IS and the router with the 0 priority can also participate in DIS selection.

This command is not available in the loopback interface view.

Examples # Configure the DIS priority on Level-2 as 127 for Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] isis dis-priority 127 level-2
```

isis enable

Syntax **isis enable** [*process-id*]

undo isis enable

View Interface view

Parameters *process-id*: Specifies a IS-IS process ID, ranging from 1 to 65535. The default is 1.

Description Use the **isis enable** command to enable an IS-IS routing process on the interface.

Use the **undo isis enable** command to disable this configuration.

No IS-IS routing process is enabled on an interface by default.

To run IS-IS, you need to use the **isis** command to enable an IS-IS process, and use the **network-entity** command to configure a network entity title (NET) for the router, and then use the **isis enable** command to enable IS-IS on each interface that needs to run the IS-IS process.

Related commands: **isis**, **network-entity**.

Examples # Create IS-IS routing process 1, and enable it on the Serial2/0 interface.

```
<Sysname> system-view
[Sysname] isis 1
[Sysname-isis-1] network-entity 10.0001.1010.1020.1030.00
[Sysname-isis-1] quit
[Sysname] interface serial2/0
[Sysname-serial2/0] isis enable 1
```

isis mesh-group

Syntax **isis mesh-group** { *mesh-group-number* | **mesh-blocked** }

undo isis mesh-group

View Interface view

Parameters *mesh-group-number*: Specifies a mesh group number from 1 to 4294967295.

mesh-blocked: Blocks the interface from flooding LSPs to make it send LSPs only after receiving requests.

Description Use the **isis mesh-group** command to add the interface into a specified mesh group.

Use the **undo isis mesh-group** command to delete the interface from a mesh group.

An interface is not in any mesh group by default.

For an interface not in a mesh group, it follows the normal process to flood the received LSPs to other interfaces. For the NBMA network with high connectivity and multiple point-to-point links, this will cause repeated LSP flooding and bandwidth waste.

After an interface is added to a mesh group, it will only flood a received LSP to interfaces not belonging to the same mesh group.

When you add an interface to a mesh group or block the interface, make sure to retain some redundancy so that a link failure will not affect the normal LSP packet flooding.

- *A mesh-group is only available for a point-to-point link interface.*
- *This command is not available in loopback interface view.*

Examples # Add the frame relay subinterface Serial2/1.1 to the mesh-group 3.

```
<Sysname> system-view
[Sysname] interface serial 2/1
[Sysname-Serial2/1] link-protocol fr
[Sysname-Serial2/1] quit
[Sysname] interface serial 2/1.1
[Sysname-Serial2/1.1] isis mesh-group 3
```

isis peer-ip-ignore

Syntax **isis peer-ip-ignore**

undo isis peer-ip-ignore

View Interface view

Parameters None

Description Use the **isis peer-ip-ignore** command to configure the PPP interface not to check peer IP address upon receiving Hello packets.

Use the **undo isis peer-ip-ignore** command to restore the default.

By default, the PPP interface checks the peer's IP address upon receiving a hello packet.

An IS-IS PPP interface requires the sender of a hello packet must be on the same network segment with it. Otherwise, it discards the hello packet. You can use the **isis peer-ip-ignore** command to disable this restriction.

Examples

- On a router:

Configure Serial2/0 not to check the peer's IP address of received Hello packets.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis peer-ip-ignore
```

isis enable

Syntax **isis silent**

undo isis silent

View Interface view

Parameters None

Description Use the **isis silent** command to disable the interface from sending and receiving IS-IS hello packets.

Use the **undo isis silent** command to restore the default.

By default, an interface is not disabled from sending and receiving hello packets.

The feature is not supported on the loopback interface.

Examples # Disable Serial 2/0 from sending and receiving hello packets.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis silent
```

isis small-hello

Syntax **isis small-hello**

undo isis small-hello

View Interface view

Parameters None

Description Use the **isis small-hello** command to configure the interface to send small Hello packets without padding field.

Use the **undo isis small-hello** command to disable the feature.

An interface sends standard Hello packets by default.

This command is not available in loopback interface view.

Examples # Configure the serial2/0 interface to send small Hello packets.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis small-hello
```

isis timer csnp

Syntax **isis timer csnp** *seconds* [**level-1** | **level-2**]

undo isis timer csnp [**level-1** | **level-2**]

View Interface view

Parameters *seconds*: Specifies the interval in seconds for sending CSNP packets over broadcast network, ranging from 1 to 600.

level-1: Applies the interval to Level-1.

level-2: Applies the interval to Level-2.

Description Use the **isis timer csnp** command to specify the interval for sending CSNP packets over broadcast network.

Use the **undo isis timer csnp** command to restore the default.

The default CSNP interval is 10 seconds.

- *If no level is specified, the CSNP interval applies to both Level-1 and Level-2 of the current ISIS process. If a level is specified, the interval applies to the level.*
- *This command is not supported on the loopback interface.*
- *This command only applies to the DIS router, which sends CSNP packets periodically.*

Examples # Configure Level-2 CSNP packets to be sent every 15 seconds over the serial2/0 interface.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis timer csnp 15 level-2
```

isis timer hello

Syntax **isis timer hello** *seconds* [**level-1** | **level-2**]

undo isis timer hello [**level-1** | **level-2**]

View Interface view

Parameters *seconds*: Specifies the interval in seconds for sending Hello packets, ranging from 3 to 255.

level-1: Specifies the interval for sending Level-1 Hello packets.

level-2: Specifies the time interval for sending Level-2 Hello packets.

Description Use the **isis timer hello** command to specify the interval for sending hello packets.

Use the **undo isis timer hello** command to restore the default.

The default hello interval is 10 seconds.

- *If no level is specified, the hello interval applies to both Level-1 and Level-2 of the current ISIS process. If a level is specified, the interval applies to the level.*
- *This command is not supported on the loopback interface.*
- *The broadcast link distinguishes between Level-1 and Level-2 packets, so you need specify intervals for the two levels respectively. The point-to-point link however does not distinguish, so you need not specify intervals respectively.*
- *As the shorter the interval is, the more system resources will be occupied, you should configure a proper interval as needed.*

Related commands: **isis timer holding-multiplier**.

Examples # Configure Level-2 Hello packets to be sent every 20 seconds over the serial2/0 interface.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] isis timer hello 20 level-2
```

isis timer holding-multiplier

Syntax **isis timer holding-multiplier** *value* [**level-1** | **level-2**]

undo isis timer holding-multiplier [**level-1** | **level-2**]

View Interface view

Parameters *value*: Number of hello intervals, in the range of 3 to 1000.

level-1: Applies the number to the Level-1 IS-IS neighbor.

level-2: Applies the number to the Level-2 IS-IS neighbor.

- *If neither level-1 nor level-2 is specified in the command, the number applies to the current level IS-IS process.*
- *This command is not available in loopback interface view.*

Description Use the **isis timer holding-multiplier** command to configure the number of hello intervals, within which if the interface receive no hello packets, its neighbor is considered dead.

Use the **undo isis timer holding-multiplier** command to restore the default.

On an interface, the default number of hello intervals is three.

You can specify the number of hello intervals for Level-1 and Level-2 neighbors respectively on a broadcast network. For a point-to-point link, there is only one kind of Hello packet, so you need not specify Level-1 or Level-2.

The specified number of hello intervals is used to configure the Holddown time. If a router receives no Hello packets from a neighbor within Holddown time, it will take the neighbor as dead. The Holddown time can be configured differently for different routers within an area. You can adjust the Holddown time by changing either the hello interval or the number of Hello intervals on an interface.

Related commands: **isis timer hello**.

Examples # Configure the number of Level-2 Hello intervals as 6 for interface serial2/0, that is, if no hello packet is received from the interface within 6 hello intervals, its neighbor is considered dead.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial 2/0] isis timer holding-multiplier 6 level-2
```

isis timer lsp

Syntax **isis timer lsp** *time* [**count** *count*]

undo isis timer lsp

View Interface view

Parameters *time*: Specifies the minimum interval in milliseconds for sending link-state packets, ranging from 1 to 1000.

count: Specifies the maximum number of link-state packets to be sent at one time, in the range of 1 to 1000. The default is 100 for the broadcast interface and 11 for point-to-point interface.

Description Use the **isis timer lsp** command to configure the interval for sending link-state packets on the interface.

Use the **undo isis timer lsp** command to restore the default of 33ms.

Related commands: **isis timer retransmit**.

This command is not available in loopback interface view.

Examples # Configure the interval as 500 milliseconds for sending LSPs on interface serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] isis timer lsp 500
```

isis timer retransmit

Syntax **isis timer retransmit** *seconds*

undo isis timer retransmit

View Interface view

Parameters *seconds*: Specifies the interval in seconds for retransmitting LSP packets, ranging from 1 to 300.

Description Use the **isis timer retransmit** command to configure the interval for retransmitting LSP packets over point-to-point link.

Use the **undo isis timer retransmit** command to restore the default of 5s.

You need not use this command over a broadcast link where no LSP response is required.

Related commands: **isis timer lsp**.

- *This command is not available in loopback interface view.*
- *Configure a proper time to avoid unnecessary retransmissions.*

Examples # Configure the LSP retransmission interval as 10 seconds for the serial2/0 interface.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] isis timer retransmit 10
```

is-level

Syntax **is-level** { **level-1** | **level-1-2** | **level-2** }

undo is-level

View IS-IS view

Parameters **level-1**: Configures the router to work on Level-1, which means it only calculates routes within the area, and maintains the L1 LSDB.

level-1-2: Configures the router to work on Level-1-2, which means it calculates routes and maintains the LSDBs for both L1 and L2.

level-2: Configures the router to work on Level-2, which means it calculates routes and maintains the LSDB for L2 only.

Description Use the **is-level** command to configure IS-IS router type.

Use the **undo is-level** command to restore the default.

The default router type is **level-1-2**.

It is recommended to configure system level when you configure IS-IS.

You can configure all the routers as either Level-1 or Level-2 if there is only one area, because there is no need for all routers to maintain two identical databases at the same time. In this case, you are recommended to configure all the routers as Level-2 in the IP network for scalability consideration.

Related commands: **isis circuit-level**.

Examples # Configure the router to work in Level-1.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] is-level level-1
```

is-name

Syntax **is-name** *sys-name*

undo is-name

View IS-IS view

Parameters *symbolic-name*: Specifies a name for the local IS, a string of 1 to 64 characters.

Description Use the **is-name** command to enable the dynamic hostname process and configure a name for the router, which is advertised in an LSP.

Use the **undo is-name** command to remove the configuration.

No IS name is configured by default.

Examples # Configure a name for the local IS.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] is-name RUTA
```

is-name map

Syntax **is-name map** *sys-id map-sys-name*

undo is-name map *sys-id*

View IS-IS view

Parameters *sys-id*: System ID or a pseudonode ID of a remote IS.

map-sys-name: Specifies a name for the remote IS, a string of 1 to 64 characters.

Description Use the **is-name map** command to map a name to a remote IS. Each remote IS system ID corresponds to only one name.

Use the **undo is-name map** command to remove the configuration.

By default, no name is configured for a remote IS.

Examples # Map the name RUTB to the remote IS 0000.0000.0041.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] is-name map 0000.0000.0041 RUTB
```

is-snmp-traps enable

Syntax **is-snmp-traps enable**

undo is-snmp-traps

View IS-IS view

Parameters None

Description Use the **is-snmp-traps enable** command to enable the SNMP Trap function of IS-IS.

Use the **undo is-snmp-traps** command to disable this function.

SNMP Trap is enabled by default.

Examples # Enable SNMP Trap.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] is-snmp-traps enable
```

log-peer-change (IS-IS view)

Syntax **log-peer-change**

undo log-peer-change

View IS-IS view

Parameters None

Description Use the **log-peer-change** command to enable logging on IS-IS adjacency state changes.

Use the **undo log-peer-change** command to disable the logging.

The feature is enabled by default.

After the feature is enabled, information about IS-IS adjacency state changes is sent to the configuration terminal.

Examples # Enable logging on the IS-IS adjacency state changes.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] log-peer-change
```

lsp-fragments-extend

Syntax **lsp-fragments-extend** [[**level-1** | **level-2** | **level-1-2**] | [**mode-1** | **mode-2**]] *

undo lsp-fragments-extend

View IS-IS view

Parameters **mode-1**: Fragment extension mode 1, used on a network where some routers do not support LSP fragment extension.

mode-2: Fragment extension mode 2, used on a network where all routers support LSP fragment extension.

level-1: Applies the fragment extension mode to Level-1 LSPs.

level-2: Applies the fragment extension mode to Level-2 LSPs.

level-1-2: Applies the fragment extension mode to both Level-1 and Level-2 LSPs.

*The **mode-1** and **level-1-2** keywords are used by default.*

Description Use the **lsp-fragments-extend** command to enable LSP fragment extension in a specified mode and level.

Use the **undo lsp-fragments-extend** command to disable this feature.

The feature is disabled by default.

Note the following:

- After LSP fragment extension is enabled in an IS-IS process, the MTUs of all the interfaces on which this IS-IS process is enabled must not be less than 512; otherwise, LSP fragment extension will not take effect.
- At least one virtual system needs to be configured for the router to generate extended LSP fragments. An IS-IS process allows 50 virtual systems at most.

Examples # Enable LSP fragment extension of **mode-1** and **Level-2**.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] lsp-fragments-extend mode-1 level-2
```

lsp-length originate

Syntax **lsp-length originate** *size* [**level-1** | **level-2**]

undo lsp-length originate [**level-1** | **level-2**]

View IS-IS view

Parameters *size*: Specifies the maximum size in bytes of a LSP packet, ranging from 512 to 16384.

level-1: Applies the size to Level-1 LSP packets.

level-2: Applies the size to Level-2 LSP packets.

If neither Level-1 nor Level-2 is specified in the command, the configured maximum size applies to the current IS-IS level.

Description Use the **lsp-length originate** command to configure the maximum size of generated Level-1 or Level-2 LSPs.

Use the **undo lsp-length originate** command to restore the default.

The maximum size of 1497 bytes is the default.

Examples # Configure the maximum size of the generated Level-2 LSPs as 1024 bytes.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] lsp-length originate 1024 level-2
```

lsp-length receive

Syntax **lsp-length receive** *size*

undo lsp-length receive

View IS-IS view

Parameters *size:* Maximum size of received LSPs, in the range of 512 to 16384 bytes.

Description Use the **lsp-length receive** command to configure the maximum size of received LSPs.

Use the **undo lsp-length receive** command to restore the default.

By default, the maximum size of received LSPs is 1497 bytes.

Examples # Configure the maximum size of received LSPs.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] lsp-length receive 1024
```

maximum load-balancing (IS-IS view)

Syntax **maximum load-balancing** *number*

undo maximum load-balancing

View IS-IS view

Parameters *number*: Maximum number of equal-cost load balanced routes, in the range 1 to 8.

Description Use the **maximum load-balancing** command to configure the maximum number of equal-cost load balanced routes.

Use the **undo maximum load-balancing** command to restore the default.

The maximum number varies by device.

Examples # Configure the maximum number of equal-cost load-balanced routes as 2.

```
<Sysname> system-view
[Sysname] isis 100
[Sysname-isis-100] maximum load-balancing 2
```

Restore the default.

```
[Sysname-isis-100] undo maximum load-balancing
```

network-entity

Syntax **network-entity** *net*

undo network-entity *net*

View IS-IS view

Parameters *net*: Network Entity Title (NET) in the format of X...X.XXXX....XXXX.00, with the first part X...X being the area address, the middle part XXXX....XXXX (a total of 12 "X") being the router's system ID and the last part 00 being SEL.

Description Use the **network-entity** command to configure the Network Entity Title for an IS-IS routing process.

Use the **undo network-entity** command to delete a NET.

No NET is configured by default.

A NET is a network service access point (NSAP), and it is in the range of 8 to 20 bytes for IS-IS.

A NET has three parts: The first part is area ID, which ranges from 1 to 13 bytes. Routers in the same area must have the same area ID. The second part is the router's 6-byte system ID, which is unique within the whole area and backbone area. The third part is the 1-byte SEL that must be 00. Generally, a router needs one NET. In the case of repartitioning an area, such as merging or splitting, you can configure multiple NETs beforehand for the router to ensure correct and continuous routing.

Related commands: **isis**, **isis enable**.

Examples # Specify the NET as 10.0001.1010.1020.1030.00, of which 10.0001 is the area ID and 1010.1020.1030 is the system ID.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] network-entity 10.0001.1010.1020.1030.00
```

preference (IS-IS view)

Syntax **preference** { **route-policy** *route-policy-name* | *preference* } *

undo preference

View IS-IS view

Parameters *preference*: Specifies the preference for IS-IS protocol, ranging from 1 to 255. *route-policy-name*: Routing policy name, a string of 1 to 19 characters. The preference applies to routes passing the routing policy.

Description Use the **preference** command to configure the preference for IS-IS protocol.

Use the **undo preference** command to restore the default.

By default, the IS-IS protocol preference is 15.

If a routing policy is specified in this command, the preference (if any) set by the routing policy applies to those matched routes. Other routes use the preference set by the **preference** command.

When a router runs multiple routing protocols at the same time, the system will set a preference to each routing protocol. If several protocols find routes to the same destination, the route of the routing protocol with the highest preference is selected.

Examples # Configure the preference of IS-IS protocol as 25.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] preference 25
```

reset isis all

Syntax **reset isis all** [*process-id* | **vpn-instance** *vpn-instance-name*]

View User view

Parameters *process-id*: Clears the data structure information of an IS-IS process numbered from 1 to 65535.

vpn-instance-name: Clears the data structure information of a VPN instance named with a string of 1 to 31 characters.

Description Use the **reset isis all** command to clear all ISIS data structure information.

No data structure information is cleared by default.

This command is used when the LSP needs to be updated immediately. For example, after performing the **area-authentication-mode** and **domain-authentication-mode** commands, you can use this command to clear old LSPs.

Related commands: **area-authentication-mode**, **domain-authentication-mode**.

Examples # Clear all IS-IS data structure information.

```
<Sysname> reset isis all
```

reset isis peer

Syntax **reset isis peer** *system-id* [*process-id* | **vpn-instance** *vpn-instance-name*]

View User view

Parameters *system-id*: Specifies the system ID of an IS-IS neighbor.

process-id: Specifies the ID of an IS-IS process, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, a string of 1 to 31 characters.

Description Use the **reset isis peer** command to clear the data structure information of a specified IS-IS neighbor.

The command is disabled by default.

This command is used when you need to re-establish an IS-IS neighbor.

Examples # Clear the data structure information of the neighbor with system ID being 0000.0c11.1111.

```
<Sysname> reset isis peer 0000.0c11.1111
```

set-overload

Syntax **set-overload** [**on-startup start-from-nbr** *system-id* [*timeout* [*nbr-timeout*]]] [**allow** { **interlevel** | **external** } *]

undo set-overload

View IS-IS view

Parameters **on-startup**: Specifies to start the overload tag timeout timer upon system startup.

start-from-nbr *system-id*: Specifies to start the overload tag timeout timer when the router begins to establish the connection with a neighbor.

timeout: Specifies the overload tag timeout timer, with an interval from 5 to 86400 seconds. The timer is started after system startup. The default is 600 seconds.

nbr-timeout: Specifies the overload tag timeout timer that is started when the router begins to establish the connection with a neighbor after system startup. The time has an interval from 5 to 86400 seconds. The default is 1200 seconds.

allow: Specifies to allow advertising address prefixes. By default, no address prefixes are allowed to be advertised when the system is in overload state.

interlevel: Allows advertising IP address prefixes learnt from different IS-IS levels with the **allow** keyword specified.

external: Allows advertising IP address prefixes learnt from other routing protocols with the **allow** keyword specified.

Description Use the **set-overload** command to set the overload tag for the current router.

Use the **undo set-overload** command to clear the overload tag.

No overload flag is set by default.

When the overload flag is set for a router, the routes calculated by the router will be ignored by other routers when they calculate SPF. (But the routes directly connected to the router will not be ignored.)

When a router is set overload tag, other routers will not send packets to the router for forwarding.

Examples # Set overload flag on the current router.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] set-overload
```

spf-slice-size

Syntax **spf-slice-size** *duration-time*

undo spf-slice-size

View IS-IS view

Parameters *duration-time*: Specifies the duration in milliseconds of each sliced SPF calculation, ranging from 10 to 50000. Each sliced SPF calculation is ended when the duration time is reached. If the *duration-time* is set to 0, the entire SPF calculation will not be sliced.

Description Use the **spf-slice-size** command to specify the duration for each sliced SPF calculation.

Use the **undo spf-slice-size** command to restore the default.

The default SPF calculation duration is 10 milliseconds.

To prevent the SPF calculation from occupying the system resources for a long time, you can use this command to slice the whole SPF calculation into pieces.

You are not recommended to change the default setting.

Examples # Set the duration of each sliced SPF calculation to 1 second.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] spf-slice-size 1000
```

summary (IS-IS view)

Syntax **summary** *ip-address* { *mask* | *mask-length* } [**avoid-feedback** | **generate_null0_route** | **tag** *tag* | [**level-1** | **level-1-2** | **level-2**]] *

undo summary *ip-address* { *mask* | *mask-length* } [**level-1** | **level-1-2** | **level-2**]

View IS-IS view

Parameters *ip-address*: Destination IP address of a summary route.

mask: Mask of the destination IP address, in dotted decimal format.

mask-length: Mask length, in the range of 0 to 32.

avoid-feedback: Specifies to avoid learning aggregate routes by routing calculation.

generate_null0_route: Specifies to generate the Null 0 route to avoid routing loops.

tag *tag*: Specifies a management tag, in the range of 1 to 4294967295.

level-1: Specifies to summarize only the routes redistributed to Level-1 area.

level-1-2: Specifies to summarize all the routes redistributed to the Level-1 and Level-2 areas.

level-2: Specifies to summarize only the routes redistributed to the Level-2 area.

Description Use the **summary** command to configure a summary route.

Use the **undo summary** command to remove a summary route.

No summarization is configured by default.

If no level is specified, only the **level-2** routes will be summarized by default.

You can summarize multiple contiguous networks with a summary network to reduce the size of the routing table, as well as that of LSP and LSDB generated by the router. It is allowed to summarize native IS-IS routes and redistributed routes. After summarization, the cost of the summary route is the smallest cost of those summarized routes.

Note that the router summarizes only routes in local LSPs.

Examples # Configure a summary route 202.0.0.0/8.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] summary 202.0.0.0 255.0.0.0
```

timer isp-generation

Syntax **timer lsp-generation** *maximum-interval* [*initial-interval* [*incremental-interval*]] [**level-1** | **level-2**]

undo timer lsp-generation [**level-1** | **level-2**]

View IS-IS view

Parameters *maximum-interval*: Maximum interval in seconds for generating ISIS LSPs, in the range 1 to 120.

initial-interval: Initial interval in milliseconds for generating ISIS LSPs, in the range 10 to 60000. The default is 0.

incremental-interval: Incremental interval (in milliseconds), in the range 10 to 60000. The default is 0.

level-1: Applies the specified intervals to generating level-1 LSPs.

level-2: Applies the specified intervals to generating level-1 LSPs.

Description Use the **timer lsp-generation** command to specify intervals for ISIS LSP generation.

Use the **undo timer isp-generation** command to restore the default.

By default, the LSP generation interval is 2 seconds.

- *If only the maximum interval is specified, this maximum interval is the LSP generation interval.*
- *If both the maximum and initial intervals are specified, the system can adjust the LSP generation interval upon topology changes. When the topology is stable, the initial interval applies as the LSP generation interval. When topology changes become frequent, the LSP generation interval is the maximum or initial interval.*
- *If all the maximum, initial and incremental intervals are specified, the system will adjust the LSP generation interval upon topology changes in this way: when the network changes are infrequent, the initial interval applies as the LSP generation interval. When the network changes become frequent, the generation interval changes between the initial and maximum intervals based on the specified incremental interval.*

By using this command to adjust the LSP generation interval, you can save the bandwidth and router resources that may be wasted due to frequent network changes.

Examples # Set the maximum LSP generation interval to 10 seconds, initial interval to 100 milliseconds and the incremental interval to 200 milliseconds.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1]timer lsp-generation 10 100 200
```

Set the maximum LSP generation interval to 15 seconds.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1]timer lsp-generation 15
```

timer lsp-max-age

Syntax **timer lsp-max-age** *seconds*

undo timer lsp-max-age

View IS-IS view

Parameters *seconds*: Specifies the LSP maximum aging time in seconds, ranging from 1 to 65535.

Description Use the **timer lsp-max-age** command to set the LSP maximum aging time for the current router.

Use the **undo timer lsp-max-age** command to restore the default.

The default is 1200 seconds.

A router puts the specified LSP maximum aging time into an LSP before advertisement. When the LSP is received by other routers, the aging time will decrease as the time goes by. If no update is received for the LSP after its aging time decreases to 0, the LSP will be deleted from the LSDB.

Related commands: **timer lsp-refresh**.

Examples # Set the maximum LSP aging time to 1500 seconds.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] timer lsp-max-age 1500
```

timer lsp-refresh

Syntax **timer lsp-refresh** *seconds*

undo timer lsp-refresh

View IS-IS view

Parameters *second*s: Specifies the LSP refresh interval in seconds, ranging from 1 to 65534.

Description Use the **timer lsp-refresh** command to set the LSP refresh interval.

Use the **undo timer lsp-refresh** to restore the default.

The default is 900 seconds.

Using this feature, you can keep LSPs in synchronization for the whole area.

Related commands: **timer lsp-max-age**.

*To refresh LSPs before they are aged out, the interval set by the **timer lsp-refresh** command must be smaller than that set by the **timer lsp-max-age** command.*

Examples # Set the LSP refresh interval to 1500 seconds.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] timer lsp-refresh 1500
```

timer spf

Syntax **timer spf** *maximum-interval* [*minimum-interval* [*incremental-interval*]]

undo timer spf

View IS-IS view

Parameters *maximum-interval*: Specifies the maximum interval (in seconds) for SPF calculations, ranging from 1 to 120.

minimum-interval: Specifies the minimum interval (in milliseconds) for SPF calculations, ranging from 10 to 60000.

incremental-interval: Specifies the incremental interval (in milliseconds) for SPF calculations, ranging from 10 to 60000.

Description Use the **timer spf** command to set the time intervals for ISIS routing calculation.

Use the **undo timer spf** command to restore the default.

The default IS-IS SPF calculation interval is 10 seconds.

When the network changes are infrequent, the SPF calculation interval decreases to the minimum interval. When the network changes become frequent, the calculation interval is increased by *inc-interval*$*(2^{n-2})$, (n is the number of network changes that triggered SPF calculations) until the maximum interval is reached.

With this feature, you can prevent the router from over consumption due to frequent network changes.

Examples # Set the maximum SPF calculation interval to 10 seconds, minimum interval to 100 milliseconds and the incremental interval to 200 milliseconds.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1]timer spf 10 100 200
```

Set the maximum SPF calculation interval to 15 seconds.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1]timer spf 15
```

virtual-system

Syntax **virtual-system** *virtual-system-id*

undo virtual-system *virtual-system-id*

View IS-IS view

Parameters *virtual-system-id*: Virtual system ID of the IS-IS process.

Description Use the **virtual-system** command to configure a virtual system ID for the IS-IS process. No extended LSPs are generated without the virtual system ID.

Use the **undo virtual-system** command to remove the virtual system ID.

Up to 50 virtual system IDs can be configured for the IS-IS process.

Examples # Set a virtual system ID of 2222.2222.2222 for IS-IS process 1.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] virtual-system 2222.2222.2222
```

75 IS-IS DEBUGGING COMMANDS

debugging isis

Syntax **debugging isis** { **adjacency** | **all** | **authentication-error** | **checksum-error** | **circuit-information** | **configuration-error** | **datalink-receiving-packet** | **datalink-sending-packet** | **event** | **general-error** | **graceful-restart** | **ha-events** | **interface-information** | **memory-allocating** | **miscellaneous-errors** | **receiving-packet-content** | **self-originate-update** | **sending-packet-content** | **snp-packet** | **spf-event** | **spf-summary** | **spf-timer** | **task-error** | **timer** | **traffic-eng** { **advertisement** | **event** } | **update-packet** } [*process-id* | [**vpn-instance** *vpn-instance-name*]]

undo debugging isis { **adjacency** | **all** | **authentication-error** | **checksum-error** | **circuit-information** | **configuration-error** | **datalink-receiving-packet** | **datalink-sending-packet** | **event** | **general-error** | **graceful-restart** | **ha-events** | **interface-information** | **memory-allocating** | **miscellaneous-errors** | **receiving-packet-content** | **self-originate-update** | **sending-packet-content** | **snp-packet** | **spf-event** | **spf-summary** | **spf-timer** | **task-error** | **timer** | **traffic-eng** { **advertisement** | **event** } | **update-packet** } [*process-id* | [**vpn-instance** *vpn-instance-name*]]

View User view

Default Level 1: Monitor level

Parameters **adjacency**: Enables IS-IS adjacency debugging.

all: Enables all IS-IS debugging.

authentication-error: Enables debugging for authentication errors.

checksum-error: Enables debugging for IS-IS LSP checksum errors.

circuit-information: Enables debugging for the IS-IS-enabled interfaces.

configuration-error: Enables debugging for configuration errors.

datalink-receiving-packet: Enables debugging for data link-layer packet receiving.

datalink-sending-packet: Enables debugging for data link-layer packet sending.

event: Enables IS-IS event debugging.

general-error: Enables debugging for IS-IS errors.

graceful-restart: Enables debugging for IS-IS GR.

ha-events: Enables debugging for data hot backup. This keyword takes effect only on a distributed device.

interface-information: Enables IS-IS interface debugging.

memory-allocating: Enables debugging for IS-IS memory allocation.

miscellaneous-errors: Enables debugging for errors unrelated to IS-IS.

receiving-packet-content: Enables debugging for received IS-IS packet contents.

self-originate-update: Enables debugging for IS-IS local updates.

sending-packet-content: Enables debugging for sent IS-IS packet contents.

snp-packet: Enables IS-IS SNP packet debugging.

spf-event: Enables debugging for IS-IS SPF route calculation.

spf-summary: Enables debugging for IS-IS route calculation summary.

spf-timer: Enables debugging for IS-IS route calculation triggers.

task-error: Enables debugging for IS-IS task errors.

timer: Enables IS-IS timer debugging.

traffic-eng: Enables debugging for IS-IS traffic switch fabricering.

advertisement: Enables debugging for IS-IS traffic switch fabricering advertisement.

event: Enables debugging for IS-IS traffic switch fabricering events.

update-packet: Enables IS-IS update packet debugging.

process-id: IS-IS process ID, in the range of 1 to 65535.

vpn-instance-name: Specifies a VPN instance name, a string of 1 to 31 characters. Support for this argument varies with device models.

Description

Use the **debugging isis** command to enable specified debugging for IS-IS. Use the **undo debugging isis** command to disable specified debugging for IS-IS.

Table 243 Description on the fields of the debugging isis adjacency command

Field	Description
Circuit State Up Success	Interface is up.
Circuit State Down Success	The interface is down (The adjacency processing was complete).

Table 243 Description on the fields of the debugging isis adjacency command

Field	Description
Rxed *helloType* Hello on *circuitName*, from SNPA *SNPA*	IS-IS received a hello packet. *helloType*: Hello packet type: Lan L1, Lan L2, or P2P. *circuitName*: Interface name *SNPA*: Source MAC address of the packet.
Sending *helloType* Hello on *circuitName*	IS-IS is sending a hello packet. *helloType*: Hello packet type: LAN L1, LAN L2, or P2P. *circuitName*: Interface name
Running DIS Election, *circuitName*	IS-IS is running a DIS election. *circuitName*: Interface name
Declaring as DIS,DIS Type *type*,on *circuitName*, Old DIS (*net1*), New DIS *net2*	IS-IS is declaring the new DIS. type: L1 or L2. *net1: Net entity title of the old DIS.* net2: Net entity title of the new DIS.
Send Failure	Sending a hello packet failed.
Update DIS Down Processing Failure	Processing the DIS Down event failed.
Circuit State change reported for Unknown Circuit Type	Interface type change error due to unknown interface type
Adjacency(s) Not deleted On circuit Down	Adjacency deletion failed after the interface was down.
Rxed P2P IIH on *circuitName*.IIH Rejected Wrong Circ Type(*circuitType*)	The received hello packet was rejected because the interface type (point-to-point) is wrong. *circuitName*: Interface name *circuitType*: Interface type, which can be L1, L2, or L12.
helloType IIH request reserved circuit type. Ignored	IS-IS received an IIH packet with interface type as reserved and therefore ignored it. *helloType*: Hello packet type: LAN L1, LAN L2, or P2P.
Rxed *helloType* IIH with duplicate Local System ID. IIH Discarded	The received hello packet was not processed due to a duplicate system ID. *helloType*: Hello packet type: LAN L1, LAN L2, or P2P.
helloType IIH Authentication Failure. IIH Discarded	The received hello packet was discarded due to an authentication failure. *helloType*: Hello packet type: LAN L1, LAN L2, or P2P.
Rxed *helloType* IIH has Invalid IP address.IIH Ignored	IP address is invalid; therefore, the received hello packet was not processed. *helloType*: Hello packet type: LAN L1, LAN L2, or P2P.
Rxed *helloType* IIH contains No usable Ip Address. IIH Discarded	The received hello packet was discarded because it contains no usable IP address. *helloType*: Hello packet type: LAN L1, LAN L2, or P2P.

Table 243 Description on the fields of the debugging isis adjacency command

Field	Description
Rxed *helloType* IIH on *circuitName* contains Duplicate Ip Address. IIH Discarded	The received hello packet was discarded because it contains a duplicate IP address. *helloType*: Hello packet type: LAN L1, LAN L2, or P2P. *circuitName*: Interface name
Rxed *helloType* IIH on % *circuitName* contains Duplicate Ipv6 Address. IIH Discarded	The received hello packet was discarded because it contains a duplicate IPv6 address. *helloType*: PDU packet type: LAN L1, LAN L2, or P2P. *circuitName*: Interface name
Rxed Serial IIH on *circuitName*, Protocol supported mismatch. IIH Discarded	The received hello packet was discarded due to a protocol mismatch. *circuitName*: Interface name
Rxed P2P IIH on % *circuitName* contains no Protocol Support at all. IIH Ignored	The received hello packet was discarded due to no protocol support. *circuitName*: Interface name
Rxed Ethernet IIH on *circuitName*. Ignored	The received Ethernet IIH packet was discarded because the interface type is not broadcast. *circuitName*: Interface name
helloType Level Mismatch.Local Level *circuitLevel*	Packet type mismatch *helloType*: Hello packet type: LAN L1, LAN L2, or P2P. *circuitLevell*: Current level of the link. It can be L1, L2, or L12.
helloType, No common protocol supported	The received hello packet matched no protocol. *helloType*: Hello packet type: LAN L1, LAN L2, or P2P.
Rxed LAN IIH from system : %*systemId*	IS-IS received an Ethernet IIH packet. *systemId*: System ID of the sending device.
Rxed P2P IIH from system : %*systemId*	IS-IS received a P2P IIH packet. *systemId*: System ID of the sending device.
Rxed ISH from system : %*systemId*	IS-IS received an ISH packet. *systemId*: System ID of the sending device.

Table 244 Description on the fields of the debugging isis authentication-error command

Field	Description
For all processes of the VPN instance *vpn-instance-name*, Indication of authentication errors debugging is on	The authentication error debugging is enabled for all the IS-IS processes of the VPN instance.
For the process *process-id*, Indication of authentication errors debugging is on	The authentication error debugging is enabled for the IS-IS process.

Table 245 Description on the fields of the debugging isis checksum-error command

Field	Description
For all processes of the VPN instance *vpn-instance-name* , IS-IS Checksum errors debugging is on	The LSP checksum error debugging is enabled for all the IS-IS processes of the VPN instance.
For the process *process-id*, IS-IS Checksum errors debugging is on	The LSP checksum error debugging is enabled for the IS-IS process.

Table 246 Description on the fields of the debugging isis circuit-information command

Field	Description
% *circuitName* not enabled for Ipv4	IPv4 is not enabled on the interface. *circuitName*: Interface name
% *circuitName* not enabled for Ipv6	IPv6 is not enabled on the interface. *circuitName*: Interface name
% *circuitName* not enabled	IS-IS is not enabled on the interface. *circuitName*: Interface name
Interface MTU should not be too small(< 131)	Interface MTU cannot be smaller than 131.
The IP is set to UP for IS-IS on interface	IP of the IS-IS enabled interface is up.
The IP is set to DOWN for IS-IS on interface	IP of the IS-IS enabled interface is down.
The IP is set to UP for ISISv6 on interface	IP of the IS-ISv6 enabled interface is up.
The IP is set to DOWN for ISISv6 on interface	IP of the IS-ISv6 enabled interface is down.
CIRC: Circ Up not processed. Circuit already up	The interface is already UP; therefore, no more interface UP requests are processed.
CIRC: Circ Down not processed. Circuit already Down	The interface is already DOWN; therefore, no more interface DOWN requests are processed.
CIRC: Join AllIS multicast address error	An error occurred while the interface was joining all the multicast groups.
CIRC: Join ALLL1IS multicast address error	An error occurred while the interface was joining L1 multicast groups.
CIRC: Join ALLL2IS multicast address error	An error occurred while the interface joined L2 multicast groups.
CIRC: Leave ALLL1IS multicast address error	An error occurred while the interface was leaving L1 multicast groups.
CIRC:Leave ALLL2IS multicast address error	An error occurred while the interface was leaving L2 multicast groups.
CIRC: Leave ALLIS multicast address error	An error occurred while the interface was leaving all the multicast groups.
CIRC : *circuitName* not enabled	IS-IS is not enabled on the interface. *circuitName*: Interface name
CIRC: Circuit *circuitName* is on wrong state while enabling	An error occurred when IS-IS was enabled on the interface. *circuitName*: Interface name
CIRC : *circuitName* not enabled for Circuit Type Change	The interface was not enabled with IS-IS when interface state changed. *circuitName*: Interface name

Table 247 Description on the fields of the debugging isis datalink-receiving-packet command

Field	Description
Circuit NOT operationally ON	Interface is not ready for operation.
SYS not functional. Ignoring recvd packet	System is not functioning and therefore ignores the received packets.
Rxed IS-IS PDU on Circuit *circuitName*, PDU's type is *packetType*	An IS-IS PDU was received on the interface. *circuitName*: Interface name *packetType*: Interface type.

Table 248 Description on the fields of the debugging isis datalink-sending-packet command

Field	Description
Sending IS-IS PDU on Circuit *circuitName*	Sending IS-IS PDU through the interface. *circuitName*: Interface name
Socket Send PDU error	An error occurred when the socket was sending a PDU.
Socket Send PDU success	Socket sent a PDU successfully.
Sending IS-IS PDU Failure	Socket failed to send a PDU.

Table 249 Description on the fields of the debugging isis general-error command

Field	Description
UPDT: PDU length mismatch in SNP: RecLen = %d, EncodeLen = %d.	SNP packet length mismatch
RECV: PDU length mismatch in Hello PDU : RecLen = %d, EncodeLen = %d	Hello packet length mismatch
PROT-ERR: Wrong P2P IIH Hdr Length, %d. It should be %d	Wrong P2P Hello packet header length
PROT-ERR: Wrong LAN IIH Hdr Length, %d. It should be %d	Wrong LAN Hello packet header length
PROT-ERR: Wrong L1/2CSNP Hdr Length, %d. It should be %d	Wrong L1/2 CSNP packet header length
PROT-ERR: Wrong L1/2 PSNP Hdr Length, %d. It should be %d	Wrong L1/2 PSNP packet header length
PROT_ERR: Wrong L1/2 LSP Hdr Length, %d. It should be %d	Wrong L1/2 LSP packet header length

Table 250 Description on the fields of the debugging isis graceful-restart command

Field	Description
RST: *levelType* T1 Timer Started on *circName*, Counter: *count*	GR timer started. *levelType*: system type, which can be L1 or L2. *count*: Number of times GR timer has started. *circName*: Interface name
RST: Notifying RM that the Process is Entering Restart.	Notifying RM that the process is entering the GR state.
RST: Notifying RM that the Process is Leaving Restart (Due to Rst Disable).	Notifying RM that the process is leaving the GR state because GR is disabled.

Table 250 Description on the fields of the debugging isis graceful-restart command

Field	Description
RST: *levelType* T1 Timer Expired on *circName*, Counter: *count*	GR timer expired. *levelType*: system type, which can be L1 or L2. *count*: Number of times GR timer has started. *circName*: Interface name
RST: Restart COMPLETE in *millisecond* ms	GR is complete. *millisecond*: Length of GR duration in milliseconds.

Table 251 Description on the fields of the debugging isis ha-events command

Field	Description
HSB-SMOOTH: Circuit *circuitName* is on wrong state while enabling	An error occurred while the interface was being enabled during the smoothing.
HSB-SMOOTH: Processing the circuit join multicast group error	An error occurred while the interface was joining the multicast group in the smoothing.
HSB-SMOOTH: Circuit *circuitName* not Consistent with RM/RM6.	The current interface is inconsistent with RM/RM6 in the smoothing.
HSB-SMOOTH: Update module processing the circuit down error	The update module failed to process the interface Down event in the smoothing.
HSB-SMOOTH: Update module processing the circuit up error	The update module failed to process the interface Up event in the smoothing.
HSB-SMOOTH: Failed to start Max LspGen timer	Starting the maximum LSP generation interval timer failed in the smoothing.
HSB-SMOOTH: LSP Expired. Purging LSP	LSP expired in the smoothing; therefore, the LSP was being deleted.
HSB-SMOOTH: While LSDB Smoothing, Failed to Start Lsp age timer	Starting LSP age timer failed in LSDB smoothing.
HSB-SMOOTH: Batch Backup was Not Complete : Resetting ISIS	Batch backup was not complete in the smoothing; therefore, IS-IS is being reset.
Length : length	Real-time backup message length

Table 252 Description on the fields of the debugging isis interface-information command

Field	Description
CIRC: MTU Size Exceeds Max PDU Size mtuSize, Setting it to Max PDU Size.	The interface MTU exceeds the maximum PDU size; therefore, the interface MTU is being set to the maximum PDU size.
IF: Disable ip route isis Failed	Disabling IP routing on the interface failed.
IF:Can't get the interface index	IS-IS cannot obtain the interface index.
IF:Can't get the interface type	IS-IS cannot obtain the interface type.
ISIS interface IPV4/V6 Addr nums exceed array maxnum	The number of IPv4/IPv6 IP addresses on the interface has exceeded the upper limit.

Table 253 Description on the fields of the debugging isis receiving-packet-content command

Field	Description
Rxed *pduLevel* CSNP From *sourceId* (*circuitName*).	IS-IS received a CSNP packet. *pduLevel*: L1 or L2. *sourceId*: Source NSAP address of the CSNP packet. *circuitName*: Name of the interface through which the CSNP packet was received.
** ** ** ** ** ** ** ** ** ** ** ** ** ** ** ** ** **	Contents in the CSNP packet, including the header, LSP entries, and Authentication Information field.
Rxed *pduLevel* PSNP From *sourceId* (*circuitName*).	IS-IS received a PSNP packet. *pduLevel*: L1 or L2. *sourceId*: Source NSAP address of the PSNP packet. *circuitName*: Name of the interface through which the PSNP packet was received.
** ** ** ** ** ** ** ** ** ** ** ** ** ** ** ** ** **	Contents in the corresponding PSNP packet, including the header, LSP entries, and Authentication Information field.

Table 254 Description on the fields of the debugging isis self-originate-update command

Field	Description
UPDT: RESET REQUIRED.	The IS-IS process needs to be reset.
UPDT: Circuit IPv4/IPv6 Up *circName*	Local interface is up (IPv4/IPv6). *circName*: Interface name.
UPDT: Circuit IPv4/IPv6 Down *circName*	Local interface is down (IPv4/IPv6). *circName*: Interface name
UPDT: Circuit Cost change process failed	Changing the local interface cost failed.
UPDT: Circuit Ipv4/v6 Addr add *ipAddress*	The IPv4/IPv6 address was added to the interface. *ipAddress*: Interface IP address.
UPDT: Circuit Ipv4/v6 Addr Del *ipAddress*	The IPv4/IPv6 address was deleted from the interface. *ipAddress*: Interface IP address.
UPDT: Rxed *levelType* Default cost Change	The default cost of the local interface changed. *levelType*: Interface level type, which can be L1 or L2.
INTELLITMR: Starting a *lspLevel* LSP Timer for LSP Generation.	IS-IS started the LSP generation timer. *lspLevel*: LSP type, which can be L1 or L2.
UPDT: Filling of Auth data in Lsp failed	Filling authentication information in the locally originated LSP failed.
UPDT: Creation of Zero lsp Desc failed	Creating local zero LSP fragment failed.
UPDT: Adding Ipv4/v6 Address *ipAddress* into *pduLevel* LSPs	The IP address was being added to the local LSPs.
UPDT: Adding in the LSP Neighbor option, TLV 22	The neighbor TLV was added to the local LSP.

Table 254 Description on the fields of the debugging isis self-originate-update command

Field	Description
UPDT: Adding Redist Address *ipAddress* into *pduLevel* LSPs,	The redistributed route was being added to the local LSPs.
UPDT: Updating LSP Option Success	IS-IS updated the LSP TLV successfully.
UPDT: Error Adding Summary Reachability in *pduLevel* LSPs	IS-IS failed to add a summary address to the local LSPs.

Table 255 Description on the fields of the debugging isis sending-packet-content command

Field	Description
Sending *pduLevel pduType* on *circuitName*.	IS-IS is sending a PDU. *pduLevel*: L1 or L2. *pduTyp*: PDU type, which can be PSNP or CSNP. *circuitName*: Name of the sending interface.
** **** ** ** ** ** **	Contents in the corresponding CSNP/PSNP packet, including the header, LSP entries, and Authentication Information field.

Table 256 Description on the fields of the debugging isis snp-packet command

Field	Description
CSNP Range from *startLspId* to e*ndLspId*	Range of received CSNP packets *startLspId*: Start LSP ID. e*ndLspId*: End LSP ID.
Rxed *pduType* From *sourceId* (*circuitName*)	PDUs were received. *pduType*: PDU type, which can be PSNP or CSNP. *sourceId*: Source NSAP address of the packet. *circuitName*: Name of the receiving interface.
SNP PDU Dropped	SNP PDU was dropped.
Sending Level *pduLevel* PSNP PDU fails	Sending a PSNP packet failed. *pduLevel*: PDU packet level, which can be L1 or L2.
Sending *content* on *circuitName*	A PSNP packet is being sent. *circuitName*: Name of the sending interface. *content:* PSNP packet content.
SNP not processed, System in Low Memory	System memory was insufficient; therefore, the SNP packets were not processed.
SNP not processed, System in Overload State (Low Memory).	The system is in the Overload state; therefore, the SNP packets were not processed.
Psnp not processed, current IS is Not DIS	The current IS was not a DIS; therefore, the received PSNP packet was not processed.
Csnp not processed on DIS	The CSNP packet was not processed on the DIS.
SNP Authentication Failure	SNP authentication failed.

Table 256 Description on the fields of the debugging isis snp-packet command

Field	Description
Sending *pduLevel* CSNP PDU fails	Sending CSNP packets failed. *pduLevel*: PDU packet level, which can be L1 or L2.
Sending CSNP on P2P Interface *circuitName*	A CSNP packet is being sent through the P2P interface.
Failed to Send CSNP PDU	Sending a CSNP PDU failed.
Sending *content* on *circuitName*	A CSNP PDU is being sent. *circuitName*: Name of the sending interface. *content:* CSNP packet content.

Table 257 Description on the fields of the debugging isis spf-event command

Field	Description
ISIS—*procId*—ISPF—NODE	SPF node-related information *procId*: IS-IS process ID.
ISPF—NODE :(L *sysLevel*)(MT *topoType*) Create NODE *sourceId* Dist: *distanceValue* Nexthops: *nexthopNum* Nbrs: *nbrNum* Parents: *parentNum* [RmtNbr] [Tree]	Root node is created when the direct neighbor relationship is established. *sysLevel*: system level *topoType*: topology type *sourceId*: Source system ID. *distanceValue*: Path cost to the root node *nexthopNum*: Number of nexthops of the node *nbrNum*: Number of neighbors of the node. *parentNum*: Number of parent nodes.
ISPF—NODE :(L *sysLevel*)(MT *topoType*) Create NODE *sourceId* Dist: *distanceValue* Nexthops: *nexthopNum* Nbrs: *nbrNum* Parents: *parentNum* [RmtNbr] [Tree] [Tent] [Direct] [Overload] [Del] [Isolated]	The local interface has become the DIS and SpfNode was created for the pseudonode. sysLevel: system level topoType: topology type sourceId: source system ID. distanceValue: Path cost to the root node nexthopNum: Number of nexthops of the node nbrNum: Number of neighbors of the node. parentNum: Number of parent nodes.
ISPF—NODE :(L *sysLevel*)(MT *topoType*) Adding System *sourceId* [Overload]	The zero fragment of an LSP was received from another system and the SPF node is being created for the system. sysLevel: system level topoType: topology type sourceId: source system ID.
ISPF—NODE :(L *sysLevel*)(MT *topoType*) Create NODE. *sourceId* [Overload]	SPF node is being created. sysLevel: system level topoType: topology type sourceId: source system ID.

Table 257 Description on the fields of the debugging isis spf-event command

Field	Description
ISPF—NODE :(L *sysLevel*)(MT topoType) Create(Exist) NODE. *sourceId* [Overload]	The SPF node was created or the node already exists.
	sysLevel: system level
	topoType: topology type
	sourceId: source system ID.
ISIS—*procId*—ISPF—ADJ	Adjacency-related information
	procId: IS-IS process ID.
ISIS—*procId*—ISPF—LINK	Adjacent link-related information
	procId: IS-IS process ID.

	sysLevel: system level
	topoType: topology type
	sourceId: source system ID.
	destId: destination system ID
	oldCost: old path cost value
	newCost: new path cost value
	attAdjNum: Number of ATT neighbors
ISPF—ADJ :(L *sysLevel*)(MT topoType) Adding Bcast ADJ *sourceId*	A broadcast network adjacency is being added
	sysLevel: system level
	topoType: topology type
	sourceId: source system ID.
ISPF—LINK :(L *sysLevel*)(MT topoType) Create(New) LINK *sourceId* --> *destId* OldCost: *oldCost* NewCost: *newCost* [AttAdjs: *attAdjNum*] [Ingore2way] [Tree] [Back] [Incr] [Decr] [Del] [Usage] [Nhop] [Involved] [NewPath]	A broadcast network link is being created.
	sysLevel: system level
	topoType: topology type
	sourceId: source system ID.
	destId: destination system ID
	oldCost: old path cost value
	newCost: new path cost value
	attAdjNum: Number of ATT neighbors
ISIS—*procId*—SPF—EVE	Information about ISPF route calculation
	procId: IS-IS process ID.
SPF—EVE :ISpf starts at *xx:xx:xx*	ISPF route calculation start time
SPF—EVE :Level—*sysLevel*—ISPF Run Started	SPF calculation is started.
	sysLevel: system level
SPF—EVE :Add Self To Tent.	Adding itself to the root node
TENT: Node(SourceId: *sourceId*) is Overload. Ignore its nbrs	The node is overloaded; therefore, its neighbors are ignored.
	sourceId: source system ID.

Table 257 Description on the fields of the debugging isis spf-event command

Field	Description
TENT: New Distance from RootNode(SourceId: *sourceId*) to The Node(SourceId: *sourceId*) is *distanceValue*.	The distance to the root node is updated. sourceId: source system ID.
TENT:Equal cost, add node(SourceId: *sourceId*) to TENT HEAP	The distances from the nodes to the root node are the same. sourceId: source system ID.
ISPF-EVE:Changed Link... *sourceId* --> *destId* OldCost: *oldCost* NewCost: *newCost* [AttAdjs: *attAdjNum*] [Ingore2way] [Tree] [Back] [Incr] [Decr] [Del] [Usage] [Nhop] [Involved] [NewPath]	Changed links. sourceId: source system ID. destId: destination system ID oldCost: old path cost value newCost: new path cost value attAdjNum: Number of ATT neighbors
CHG: Node's usage/nexthop will be changed.Dist: *distanceValue* Nexthops: *nexthopNum* Nbrs: *nbrNum* Parents: *parentNum* [RmtNbr] [Tree] [Tent] [Direct] [Overload] [Del] [Isolated]	The adjacency protocol type or nexthop of the local node is changed. distanceValue: Cost to the root node. nexthopNum: Number of nexthops of the node nbrNum: Number of neighbors of the node. parentNum: Number of parent nodes.
CHG: Ignore2way Link of the ROOT node is considered. Dist: *distanceValue* Nexthops: *nexthopNum* Nbrs: *nbrNum* Parents: *parentNum* [RmtNbr] [Tree] [Tent] [Direct] [Overload] [Del] [Isolated]	For the link of the local node, the two-way check was ignored. distanceValue: Cost to the root node. nexthopNum: Number of nexthops of the node nbrNum: Number of neighbors of the node. parentNum: Number of parent nodes.
ISIS—*procId*—AREA	Area address-related information procId: IS-IS process ID.
AREA:Install one Area [*newareaAddress*] for L *sysLevel* MT *topoType l1referCount / l2referCount* [ADV]	A new area address is added. newareaAddress: New area address sysLevel: system level topoType: topology type l1referCount: Level 1 reference count of the area address. l2referCount: Level 2 reference count of the area address.
AREA:Remove one Area [*oldareaAddress*] for L *sysLevel* MT *topoType l1referCount / l2referCount* [ADV]Remove an area address. oldareaAddress: Old area addresstopoType: topology typel1referCount: Level 1 reference count of t	Remove an area address. oldareaAddress: Old area address topoType: topology type l1referCount: Level 1 reference count of the area address. l2referCount: Level 2 reference count of the area address.
ISIS—*procId*—SPF—PRC	Information about PRC route updates procId: IS-IS process ID.

Table 257 Description on the fields of the debugging isis spf-event command

Field	Description
SPF—PRC:Received L *sysLevel* System Change Event for *msgString*, Change = *chgEvent*	SpfNode change was sent to PRC for processing.
	sysLevel: system level
	msgString: Node change event type.
SPF—PRC:Inform L *sysLevel* Change to Area and Route, Total Change Node:*totalNum*	Inform system ID changes to the area address and route update module
	sysLevel: system level
	totalNum: total node changes
ISIS—*procId*—AREA	Area address-related information and ATT-related information
	procId: IS-IS process ID.
RT Calculation: Elapsed time: *millSeconds* Milliseconds	Route calculation time elapsed in milliseconds
ISIS—*procId*—DEC—PRC	Information of PRC route updates
DEC—PRC :Processing L *sysLevel* LSPs of System : *sourceId*, Change Type = *chgType*	Processing the LSPs of the changed system node.
	sysLevel: system level
	sourceId: source system ID
	chgType: change type

Table 258 Description on the fields of the debugging isis spf-summary command

Field	Description
FWDB-LIMIT::Need to Process ISIS MaxRouteLimit Resume.	Restore the maximum routes in the route table in the case that the route table is not full.

Table 259 Description on the fields of the debugging isis spf-timer command

Field	Description
SPF-TRIG: SPF Scheduled Event (before): *trigEvent*, Run Level: *levelType*.	SPF schedule starts. Triggered event and run level are displayed.
	levelType: Run level of SPF calculation

Table 260 Description on the fields of the debugging isis traffic-eng { advertisement | event } command

Field	Description
Received Extended IS Reach information from LSP	An LSP with the TLV of an extended reachable address was received.
TE: Get TE Info for Circuit %s Failed in Circ Enable.	Tunnel interface has been disabled; therefore, getting tunnel interface information failed.
TE: Add If Te info failed	Adding TE interface information failed.
TE: Rm Traffic Engineering change status to enable.	RM TE status changes to "enabled".
TE: ISIS Update Te LinkInfo In Local TeDb.	ISIS updates TE link information in the local TE database.

Table 261 Description on the fields of the debugging isis update-packet command

Field	Description
pdu length: *pduLen*	Length of received PDU
Adjacency Usage: *adjType*	Adjacency type
Fast Flood *levelType* LSP before SPF	LSPs are fast-flooded before SPF calculation. *levelType*: LSP level, which can be L1 or L2.
RECV: Rxed IS-IS PDU of *pduLen* which is greater than receive size(*receiveLen*)	Received an IS-IS PDU with a *pduLen* greater than receive size (*receiveLen*).
Err!Lsp fragment exceeding Max limit !!!	LSP fragment number exceeds the maximum limit.
UPDT: Circuit up failed	Failed to bring up the interface.
UPDT: Circuit not brought down	Failed to bring down the interface.
Fast Flood L1/L2 LSP when FastFlood timer expired.	Fast-flood L1/L2 LSPs upon expiration of the Fastflood timer.
UPDT: Error! Txmission of Csnp on P2Pckt failed	Transmission of CSNP packets on a P2P network failed.
UPDT: Rx Man area change	The area address in the received LSP changed.
UPDT: Err! Zero Lsp Desc not present	Error! Zero LSP fragment is not present.
UPDT: Err, Match not found for the area addr option	No match is found for the area address in the L1 LSP.
UPDT: Rx att flag change	ATT flag changed in the received LSP.
UPDT: Fatal! Failed to flood Lsp with oload bit set	Failed to flood the LSP because overload bit is set.
UPDT: LSDB Enters Normal Over Load State	The LSDB enters the "overloaded" state.
UPDT: update process recovered from Normal Oload !	The LSDB leaves the "overloaded" state.
UPDT: Rx IP change from config	IP reachable TLV in the received LSP changed.
UPDT: v4/v6 Default Info Origination Denied by Policy.	Default route information failed to pass the policy and therefore was not sent in an LSP.
UPDT: Default Info Origination Permitted by Policy.	Default route information passed the policy and therefore was sent in an LSP.
UPDT: Adj Up failed	Failed to bring up the adjacency.
UPDT: Err1 Processing of Adj down not successful !. SysType *sysLevel* Usage *adjType*	The L1/L2/L12 system failed to process the L1/L2/L12 adjacency down event.
UPDT: Learnt Area Addr change	The area address in the received LSP is changed.
UPDT: MinLspGen Timer hasn't expired. Not generating Lsp	The minimum LSP generation interval has not expired, so no new LSPs can be generated.
UPDT: Err! Unexpected Level *levelType*	The type of the received LSP is invalid. *levelType*: LSP level, L1 or L2
UPDT: Lsp with Invalid IS Nbr Id	The received LSP has an invalid neighbor system ID.
UPDT: Max Area Mismatch.	The maximum area address number in the received LSP does not match that of the current device.
UPDT: Invalid LSP specific hdr !	Invalid received LSP packet header
UPDT: Received LSP Not processed on Broadcast Circuit due to Low Memory, LSP Dropped	The received LSP was dropped due to insufficient memory of the broadcast interface.

Table 261 Description on the fields of the debugging isis update-packet command

Field	Description
UPDT: Received LSP Not processed on P2P Circuit due to Low Memory, Sending Acknowledgement)	The received LSP was dropped due to insufficient memory of the P2P interface and an acknowledgement packet was sent.
UPDT: LSP newer than data base copy.	The received LSP is newer and the local LSDB is updated.
UPDT: Expired Own LSP received. Just Acknowledging.	Remaintime of the received LSP is 0 and therefore only an acknowledge packet is sent.
UPDT: LSP's SeqNumber is 0.	The LSP's sequence number is 0, which is invalid.
UPDT: Err, Area Addr Option in pseudonode Lsps !!	Error: The area address TLV exists in pseudonode LSPs.

Examples # Router A and Router B are interconnected. On Router A, an IS-IS process is created with a System ID of 0000.0000.0001 and router type of **level-1-2**; IS-IS is enabled on VLAN-interface 100 with the IP address 100.1.1.1/24. On Router B, another IS-IS process is created with a System ID of 0000.0000.0002 and router type of **level-1-2**; IS-IS is enabled on VLAN-interface 100 with the IP address 100.1.1.2/24. RTA and RTB are in the same area 49.0001. Enable IS-IS adjacency packet debugging on Router A.

```
<Sysname>debugging isis adjacency
ISIS-1-ADJ: Circuit State Up Success.
ISIS-1-ADJ: Rxed Lan L1 Hello on Vlan100,from SNPA 00e0.fc00.3301.
ISIS-1-ADJ: Sending Lan L1 Hello on Vlan100.
ISIS-1-ADJ: Rxed Lan L2 Hello on Vlan100,from SNPA 00e0.fc00.3301.
ISIS-1-ADJ: Sending Lan L2 Hello on Vlan100.
ISIS-1-ADJ: Rxed Lan L1 Hello on Vlan100,from SNPA 00e0.fc00.3301.
```

// L2 and L2 hello packets were sent and received on VLAN-interface 100, with the SNPA address of the peer as 00e0.fc00.3301.

```
ISIS-1-ADJ: Running DIS Election,Vlan100
ISIS-1-ADJ: Declaring as DIS,DIS Type L2,on Vlan100, Old DIS (null),
 New DIS 0000.0000.0001.01.
ISIS-1-ADJ: Running DIS Election,Vlan100
ISIS-1-ADJ: Declaring as DIS,DIS Type L1,on Vlan100, Old DIS (null),
 New DIS 0000.0000.0001.01.
```

// An *L1/L2 neighbor relationship* w*as established between Router A and Router* B*, and a DIS election was performed.*

VLAN-interface 100 on Router A is connected to VLAN-interface 100 on Router B. An IS-IS process is created on Router A and Router B respectively. Enable interface circuit debugging for IS-IS. Disable IS-IS and then enable it on VLAN-interface 100 of Router A.

```
<Sysname>debugging isis circuit-information
[Sysname]interface vlan-interface 100
[Sysname-Vlan-interface100]undo isis enable
[Sysname-Vlan-interface100]isis enable
ISIS-1-CIRC: Received Circuit OperState ON : Enabling the Circuit
ISIS-1-CIRC: The IP is set to UP for IS-IS on interface Vlan100
```

// The IP address took effect on the IS-IS interface.

Router A and Router B are interconnected and have established an IS-IS adjacency with each other. Router A is elected as the DIS. Enable debugging for the received IS-IS packets on Router A and Router B respectively.

```
ISIS-1-SNP: CSNP Range from 0000.0000.0000.00-00  to  ffff.ffff.ffff.ff-ff.
ISIS-1-SNP: Rxed L1 CSNP From 0000.0000.0001 (Vlan100).
ISIS-1-SNP: CSNP Range from 0000.0000.0000.00-00  to ffff.ffff.ffff.ff-ff.
ISIS-1-SNP: Rxed L2 CSNP From 0000.0000.0001 (Vlan100).
```

// Router B received CSNP packets within a maximum range of 0000.0000.0000.00-00 to ffff.ffff.ffff.ff-ff.

```
ISIS-1-SNP: Sending L1 CSNP on Vlan100.
ISIS-1-SNP: Sending L2 CSNP on Vlan100.
```

// Router B sent CSNP packets.

VLAN-interface 100 on Router A is connected to VLAN-interface 100 on Router B. Create an IS-IS process on Router A and Router B respectively, enable IS-IS on the interfaces, and configure them. On Route A, enable local update debugging; enable IS-IS and then disable it on VLAN-interface 100.

```
<Sysname>debugging isis self-originate-update
[Sysname-Vlan-interface100]undo isis enable
ISIS-1-UPDT: Deleting from the LSP Neighbour option, TLV 2

76 OSPF CONFIGURATION COMMANDS

- *Refer to "MPLS TE Configuration Commands" on page 1565 for OSPF TE related commands.*
- *Refer to "MPLS L2VPN Configuration Commands" on page 1645 and "MPLS L3VPN Configuration Commands" on page 1671.*

abr-summary (OSPF area view)

Syntax **abr-summary** *ip-address* { *mask* | *mask-length* } [**advertise** | **not-advertise**] [**cost** *cost*]

undo abr-summary *ip-address* { *mask* | *mask-length* }

View OSPF area view

Parameters *ip-address*: IP address of the summary route, in dotted decimal format.

mask: Mask of the IP address in dotted decimal format.

mask-length: Mask length, in the range 0 to 32 bits.

advertise | **not-advertise**: Advertises or not to advertise the summary route. By default, the summary route is advertised.

cost *cost*: Specifies the cost of the summary route, in the range 1 to 16777215. The default cost is to the biggest cost value among routes that are summarized.

Description Use the **abr-summary** command to configure a summary route on the Area Border Router.

Use the **undo abr-summary** command to remove a summary route.

By default, no route summarization is available on an ABR.

This command is applicable to ABRs only and is used for route summarization in an area. Multiple contiguous networks may be available in an area, where you can summarize them with one network on the ABR for advertisement. The ABR advertises only the summary route to other areas.

With the **undo abr-summary** command used, summarized routes will be advertised.

Examples # Summarize networks 36.42.10.0/24 and 36.42.110.0/24 in Area1 with 36.42.0.0/16 for advertisement to other areas.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] network 36.42.10.0 0.0.0.255
[Sysname-ospf-100-area-0.0.0.1] network 36.42.110.0 0.0.0.255
[Sysname-ospf-100-area-0.0.0.1] abr-summary 36.42.0.0 255.255.0.0
```

area (OSPF view)

Syntax **area** *area-id*

undo area *area-id*

View OSPF view

Parameters *area-id*: ID of an area, a decimal integer in the range 0 to 4294967295 that is translated into IP address format by the system, or an IP address.

Description Use the **area** command to create an area and enter area view.

Use the **undo area** command to remove a specified area.

No OSPF area is created by default.

Examples # Create Area0 and enter Area 0 view

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 0
[Sysname-ospf-100-area-0.0.0.0]
```

asbr-summary

Syntax **asbr-summary** *ip-address* { *mask* | *mask-length* } [**tag** *tag* | **not-advertise** | **cost** *cost*]*

undo asbr-summary *ip-address* { *mask* | *mask-length* }

View OSPF view

Parameters *ip-address*: IP address of the summary route in dotted decimal notation.

mask: Summary route mask, in dotted decimal notation.

mask-length: Length of summary route mask, in the range 0 to 32 bits.

not-advertise: Specifies not to advertise the summary route. If the keyword is not specified, the route is advertised.

tag *tag*: Specifies a tag value for the summary route, used by a route policy to control route advertisement, in the range 0 to 4294967295. The value defaults to 1.

cost *cost*: Specifies the cost of the summary route, in the range 1 to 16777214. For Type-1 external routes, the cost defaults to the biggest cost among routes that are summarized. For Type-2 external routes, the cost defaults to the value of the biggest cost among routes that are summarized plus 1.

Description Use the **asbr-summary** command to configure a summary route.

Use the **undo asbr-summary** command to remove a summary route.

No route summarization is configured by default.

With the **asbr-summary** command configured on an ASBR, it summarizes redistributed routes that fall into the specified address range with a single route. If the ASBR resides in an NSSA area, it advertises the summary route in a Type-7 LSA into the area.

With the **asbr-summary** command configured on an NSSA ABR, it summarizes routes in Type-5 LSAs translated from Type-7 LSAs with a single route and advertises the summary route to other areas. This command does not take effect on non NSSA ABRs.

With the **undo asbr-summary** command used, summarized routes will be advertised.

Related commands: **display ospf asbr-summary**.

Examples # Summarize redistributed routes with a single route.

```
<Sysname> system-view
[Sysname] ip route-static 10.2.1.0 24 null 0
[Sysname] ip route-static 10.2.2.0 24 null 0
[Sysname] ospf 100
[Sysname-ospf-100] import-route static
[Sysname-ospf-100] asbr-summary 10.2.0.0 255.255.0.0 tag 2 cost 100
```

authentication-mode

Syntax **authentication-mode** { **simple** | **md5** }

undo authentication-mode

View OSPF area view

Parameters **simple**: Specifies the simple authentication mode.

md5: Specifies the MD5 ciphertext authentication mode.

Description Use the **authentication-mode** command to specify an authentication mode for the OSPF area.

Use the **undo authentication-mode** command to cancel a specified authentication mode.

By default, no authentication mode is configured for an OSPF area.

Routers that reside in the same area must have the same authentication mode: non-authentication, simple, or MD5.

Related commands: **ospf authentication-mode**.

Examples # Specify the MD5 ciphertext authentication mode for OSPF area0.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 0
[Sysname-ospf-100-area-0.0.0.0] authentication-mode md5
```

bandwidth-reference (OSPF view)

Syntax **bandwidth-reference** *value*

undo bandwidth-reference

View OSPF view

Parameters *value*: Specifies a bandwidth reference value for link cost calculation, in the range 1 to 2147483648 Mbps.

Description Use the **bandwidth-reference** command to specify a reference bandwidth value for link cost calculation.

Use the **undo bandwidth-reference** command to restore the default value.

The default value is 100 Mbps.

When links have no cost values configured, OSPF calculates their cost values: Cost=Reference bandwidth value / Link bandwidth. If the calculated cost value is greater than 65535, the maximum cost will be 65535.

Examples # Specify the reference bandwidth value as 1000 Mbps.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] bandwidth-reference 1000
```

default

Syntax **default** { **cost** *cost* | **limit** *limit* | **tag** *tag* | **type** *type* } *

undo default { **cost** | **limit** | **tag** | **type** } *

View OSPF view

Parameters *cost*: Specifies the default cost for redistributed routes, in the range 0 to 16777214.

limit: Specifies the default upper limit of routes redistributed per time, in the range 1 to 2147483647.

tag: Specifies the default tag for redistributed routes, in the range 0 to 4294967295.

type: Specifies the default type for redistributed routes: 1 or 2.

Description Use the **default** command to configure default parameters for redistributed routes: cost, route type (Type1 or Type2), tag, and the upper limit.

Use the **undo default** command to restore default values.

The cost, route type, tag, and the upper limit are 1, 2, 1 and 1000 by default.

Related commands: **import-route (OSPF view)**.

Examples # Configure default parameters cost as 10, upper limit as 20000, tag as 100 and type as 2 for redistributed external routes.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] default cost 10 limit 20000 tag 100 type 2
```

default-cost (OSPF area view)

Syntax **default-cost** *cost*

undo default-cost

View OSPF area view

Parameters *cost*: Specifies a cost for the default route advertised to the Stub or NSSA area, in the range 0 to 16777214.

Description Use the **default-cost** command to specify a cost for the default route advertised to the stub or NSSA area.

Use the **undo default-cost** command to restore the default value.

The cost defaults to 1.

This command is only applicable to the ABR of a stub area or the ABR/ASBR of an NSSA area.

Related commands: **stub (OSPF area view)**, **nssa**.

Examples # Configure Area1 as a stub area, and specify the cost of the default route advertised to the stub area as 20.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] stub
[Sysname-ospf-100-area-0.0.0.1] default-cost 20
```

default-route-advertise (OSPF view)

Syntax **default-route-advertise** [[**always** | **cost** *cost* | **type** *type* | **route-policy** *route-policy-name*] * | **summary cost** *cost*]

default-route-advertise summary cost *cost*

undo default-route-advertise

View OSPF view

Parameters **always**: Generates a default external route in an ASE LSA into the OSPF routing domain, if the router has no default route configured. Without this keyword, the local router can generate a Type-5 LSA describing the default route for advertisement only if the router has the default route configured.

cost *cost*: Specifies the cost for the default route, in the range 0 to 16777214. The default is 1.

type *type*: Specifies the ASE LSA type: 1 or 2, which defaults to 2.

route-policy *route-policy-name*: Specifies the route policy name, a string of 1 to 19 characters. If the default route matches the specified route policy, the route policy affects some value in the ASE LSA.

summary: Advertises the Type-3 summary LSA of the specified default route.

Description Use the **default-route-advertise** command to generate a default route into the OSPF routing domain.

Use the **undo default-route-advertise** command to disable OSPF from distributing a default external route.

By default, no default route is distributed.

Using the **import-route** command cannot redistribute a default route. To do so, use the **default-route-advertise** command. If the default route is not configured on the local router, to generate a Type-5 LSA describing the default route, use the **default-route-advertise always** command.

The **default-route-advertise summary cost** command is applicable only to VPNs, and the default route is redistributed in a Type-3 LSA. The PE router advertises the redistributed default route to the CE router.

Related commands: **import-route (OSPF view)**

Examples # Generate a default route in an ASE LSA into the OSPF routing domain (no default route configured on the router).

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] default-route-advertise always
```

description (OSPF/OSPF area view)

Syntax **description** *description*

undo description

View OSPF view/OSPF area view

Parameters *description*: Describes OSPF process in OSPF view, or describes OSPF area in OSPF area view. *description* is a string of up to 80 characters.

Description Use the **description** command to describe an OSPF process or area.

Use the **undo description** command to remove the description.

No description is configured by default.

Use of this command is only for identification of an OSPF process or area, and has no special meaning.

Examples # Describe the OSPF process 100 as **abc**.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] description abc
```

Describe the OSPF area0 as **bone area**.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 0
[Sysname-ospf-100-area-0.0.0.0] description bone area
```

display ospf abr-asbr

Syntax **display ospf** [*process-id*] **abr-asbr**

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **display ospf abr-asbr** command to display information about ABR/ASBR.

If no process is specified, ABR/ASBR information of all OSPF processes is displayed.

If you use this command on routers in a stub area, no ASBR information is displayed.

Examples # Display information about ABR/ASBR.

```
<Sysname> display ospf abr-asbr

          OSPF Process 1 with Router ID 192.168.1.2
                 Routing Table to ABR and ASBR

Type        Destination       Area        Cost  Nexthop         RtType
 Inter       3.3.3.3           0.0.0.0     3124  10.1.1.2         ASBR

```

Table 262 Description on the fields of the display ospf abr-asbr command

Field	Description
Type	Intra-area router or Inter-area router
Destination	Router ID of an ABR/ASBR
Area	ID of the area of the next hop
Cost	Cost from the router to the ABR/ASBR
Nexthop	Next hop address
RtType	Router type: ABR, ASBR

display ospf asbr-summary

Syntax **display ospf** [*process-id*] **asbr-summary** [*ip-address* { *mask* | *mask-length* }]

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

ip-address: Matched IP address, in dotted decimal format.

mask: IP address mask, in dotted decimal format.

mask-length: Mask length, in the range 0 to 32 bits.

Description Use the **display ospf asbr-summary** command to display information about the redistributed routes that are summarized.

If no OSPF process is specified, related information of all OSPF processes is displayed.

If no IP address is specified, information about all summarized redistributed routes will be displayed.

Related commands: **asbr-summary**.

Examples # Display information about all summarized redistributed routes.

```
<Sysname> display ospf asbr-summary

          OSPF Process 1 with Router ID 2.2.2.2
                  Summary Addresses

 Total Summary Address Count: 1

Table 263 Description on the fields of the display ospf asbr-summary command

Field	Description
Total Summary Address Count	Total summary route number
Net	The address of the summary route
Mask	The mask of the summary route address
Tag	The tag of the summary route
Status	The advertisement status of the summary route
Cost	The cost to the summary route
The Count of Route	The count of routes that are summarized
Destination	Destination address of a summarized route
Net Mask	Network mask of a summarized route
Proto	Routing protocol
Process	Process ID of routing protocol
Type	Type of a summarized route
Metric	Metric of a summarized route

display ospf brief

Syntax **display ospf** [*process-id*] **brief**

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **display ospf brief** command to display OSPF brief information. If no OSPF process is specified, brief information of all OSPF processes is displayed.

Examples # Display OSPF brief information.

```
<Sysname> display ospf brief
          OSPF Process 1 with Router ID 192.168.1.2
                  OSPF Protocol Information

 RouterID: 192.168.1.2      Border Router:  NSSA
 Route Tag: 0
 Multi-VPN-Instance is not enabled

ay 1
```

Table 264 Description on the fields of the display ospf brief command

Field	Description
RouterID	Router ID of this router
Border Router	An ABR, ASBR or NSSA ABR
Route Tag	The tag of redistributed routes
Multi-VPN-Instance is not enabled	The current OSPF process supports no multi-VPN-instance
Applications Supported	Applications supported
SPF-schedule-interval	Interval for SPF calculation
LSA generation interval	LSA generation interval
LSA arrival interval	The minimum LSA repeat arrival interval
Default ASE Parameter	Default ASE Parameter: metric, tag, route type.
Route Preference	Internal route priority
ASE Route Preference	External route priority
SPF Computation count	SPF computation count of the OSPF process
RFC1583 Compatible	Compatible with routing rules defined in RFC1583
Area Count	Area number of the current process
Nssa Area Count	NSSA area number of the current process
ExChange/Loading Neighbors	Neighbors in ExChange/Loading state

Table 264 Description on the fields of the display ospf brief command

Field	Description
Area	Area ID in the IP address format
Authtype	Authentication type of the area: Non-authentication, simple authentication, or MD5 authentication
Area flag	The type of the area
SPF scheduled Count	SPF calculation count in the OSPF area
Interface	IP address of the interface
Cost	Interface cost
State	Interface state
Type	Interface network type
MTU	Interface MTU
Priority	Router priority
Designated Router	The Designated Router
Backup Designated Router	The Backup Designated Router
Timers	Intervals of timers: hello, dead, poll, retransmit, and transmit delay
Transmit Delay	LSA transmit delay on the interface

display ospf cumulative

Syntax **display ospf** [*process-id*] **cumulative**

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **display ospf cumulative** command to display OSPF statistics.

Use of this command is helpful for troubleshooting.

Examples # Display OSPF statistics.

```
<Sysname> display ospf cumulative
          OSPF Process 1 with Router ID 2.2.2.2
                  Cumulations

Table 265 Description on the fields of the display ospf cumulative command

Field	Description
IO statistics	Statistics about inbound/outbound packets and LSAs
Type	OSPF packet type
Input	Packets received
Output	Packets sent
Hello	Hell packet
DB Description	Database Description packet
Link-State Req	Link-State Request packet
Link-State Update	Link-State Update packet
Link-State Ack	Link-State Acknowledge packet
LSAs originated by this router	LSAs originated by this router
Router	Type-1 LSA
Network	Type-2 LSA
Sum-Net	Type-3 LSA
Sum-Asbr	Type-4 LSA
External	Type-5 LSA
NSSA	Type-7 LSA
Opq-Link	Type-9 LSA
Opq-Area	Type-10 LSA
Opq-As	Type-11 LSA
LSA originated	LSA originated
LSA Received	LSA received
Routing Table	Routing table
Intra Area	Intra-area route number
Inter Area	Inter-area route number
ASE/NSSA	Number of ASE/NSSA routes

display ospf error

Syntax **display ospf** [*process-id*] **error**

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **display ospf error** command to display OSPF error information.

If no process is specified, OSPF error information of all OSPF processes is displayed.

Examples # Display OSPF error information.

```
<Sysname> display ospf error

          OSPF Process 1 with Router ID 192.168.80.100
                  OSPF Packet Error Statistics

0    : OSPF Router ID confusion     0    : OSPF bad packet
0    : OSPF bad version             0    : OSPF bad checksum
0    : OSPF bad area ID             0    : OSPF drop on unnumber interface
0    : OSPF bad virtual link        0    : OSPF bad authentication type
0    : OSPF bad authentication key  0    : OSPF packet too small
0    : OSPF Neighbor state low      0    : OSPF transmit error
0    : OSPF interface down          0    : OSPF unknown neighbor
0    : HELLO: Netmask mismatch      0    : HELLO: Hello timer mismatch
0    : HELLO: Dead timer mismatch   0    : HELLO: Extern option mismatch
0    : HELLO: NBMA neighbor unknown 0    : DD: MTU option mismatch
0    : DD: Unknown LSA type         0    : DD: Extern option mismatch
0    : LS ACK: Bad ack              0    : LS ACK: Unknown LSA type
0    : LS REQ: Empty request        0    : LS REQ: Bad request
0    : LS UPD: LSA checksum bad     0    : LS UPD: Received less recent LSA
0    : LS UPD: Unknown LSA type
```

Table 266 Description on the fields of the display ospf error command

Field	Description
OSPF Router ID confusion	Packets with duplicate route ID
OSPF bad packet	Packets illegal
OSPF bad version	Packets with wrong version
OSPF bad checksum	Packets with wrong checksum
OSPF bad area ID	Packets with invalid area ID
OSPF drop on unnumber interface	Packets dropped on the unnumbered interface
OSPF bad virtual link	Packets on wrong virtual links
OSPF bad authentication type	Packets with invalid authentication type
OSPF bad authentication key	Packets with invalid authentication key
OSPF packet too small	Packets too small in length
OSPF Neighbor state low	Packets received in low neighbor state
OSPF transmit error	Packets with error when being transmitted
OSPF interface down	Shutdown times of the interface
OSPF unknown neighbor	Packets received from unknown neighbors
HELLO: Netmask mismatch	Hello packets with mismatched mask
HELLO: Hello timer mismatch	Hello packets with mismatched hello timer
HELLO: Dead timer mismatch	Hello packets with mismatched dead timer
HELLO: Extern option mismatch	Hello packets with mismatched option field
HELLO: NBMA neighbor unknown	Hello packets received from unknown NBMA neighbors
DD: MTU option mismatch	DD packets with mismatched MTU
DD: Unknown LSA type	DD packets with unknown LSA type
DD: Extern option mismatch	DD packets with mismatched option field
LS ACK: Bad ack	Bad LSAck packets for LSU packets

Table 266 Description on the fields of the display ospf error command

Field	Description
LS ACK: Unknown LSA type	LSAck packets with unknown LSA type
LS REQ: Empty request	LSR packets with no request information
LS REQ: Bad request	Bad LSR packets
LS UPD: LSA checksum bad	LSU packets with wrong LSA checksum
LS UPD: Received less recent LSA	LSU packets without latest LSA
LS UPD: Unknown LSA type	LSU packets with unknown LSA type

display ospf interface

Syntax **display ospf** [*process-id*] **interface** [**all** | *interface-type interface-number*]

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

all: Display OSPF information of all interfaces.

interface-type interface-number: Interface type and interface number.

Description Use the **display ospf interface** command to display OSPF interface information.

If no OSPF process is specified, OSPF interface information of all OSPF processes is displayed.

Examples # Display OSPF interface information.

```
<Sysname> display ospf interface

          OSPF Process 1 with Router ID 192.168.1.1
                  Interfaces

 Area: 0.0.0.0
 IP Address      Type          State    Cost  Pri   DR              BDR
 192.168.1.1     PTP           P-2-P    1562  1     0.0.0.0         0.0.0.0

 Area: 0.0.0.1
 IP Address      Type          State    Cost  Pri   DR              BDR
 172.16.0.1      Broadcast     DR       1     1     172.16.0.1      0.0.0.0
```

Table 267 Description on the fields of the display ospf interface command

Field	Description
Area	Area ID of the interface
IP address	Interface IP address (regardless of whether TE is enabled or not)
Type	Interface network type: PTP, PTMP, Broadcast, or NBMA
State	Interface state defined by interface state machine: DOWN, Waiting, p-2-p, DR, BDR, or DROther
Cost	Interface cost
Pri	Router priority

Table 267 Description on the fields of the display ospf interface command

Field	Description
DR	The DR on the interface's network segment
BDR	The BDR on the interface's network segment

display ospf lsdb

Syntax **display ospf** [*process-id*] **lsdb** [**brief** | [{ **ase** | **router** | **network** | **summary** | **asbr** | **nssa** | **opaque-link** | **opaque-area** | **opaque-as** } [*link-state-id*]] [**originate-router** *advertising-router-id* | **self-originate**]]

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

brief: Displays brief LSDB information.

ase: Displays Type5 LSA (AS External LSA) information in the LSDB.

router: Displays Type1 LSA (Router LSA) information in the LSDB.

network: Displays Type2 LSA (Network LSA) information in the LSDB.

summary: Displays Type3 LSA (Network Summary LSA) information in the LSDB.

asbr: Displays Type4 LSA (ASBR Summary LSA) information in the LSDB.

nssa: Displays Type7 LSA (NSSA External LSA) information in the LSDB.

opaque-link: Displays Type9 LSA (Opaque-link LSA) information in the LSDB.

opaque-area: Displays Type10 LSA (Opaque-area LSA) information in the LSDB.

opaque-as: Displays Type11 LSA (Opaque-AS LSA) information in the LSDB.

link-state-id: Link state ID, in the IP address format.

originate-router *advertising-router-id*: Specifies the IP address of the router by which to display information of LSAs advertised.

self-originate: Displays information about LSAs originated by this router.

Description Use the **display ospf lsdb** command to display LSDB information.

If no OSPF process is specified, LSDB information of all OSPF processes is displayed.

Examples # Display OSPF LSDB information.

```
<Sysname> display ospf lsdb
         OSPF Process 1 with Router ID 192.168.0.1
                 Link State Database
```

```
                    Area: 0.0.0.0

```

Table 269 Description on the fields of the display ospf 1 lsdb network command

Field	Description
Type	LSA type
LS ID	DR IP address
Adv Rtr	Router that advertised the LSA
LS Age	LSA age time
Len	LSA length
Options	LSA options
Seq#	LSA sequence number
Chksum	LSA checksum
Net Mask	Network mask
Attached Router	ID of the router that established adjacency with the DR, and ID of the DR itself

display ospf nexthop

Syntax **display ospf** [*process-id*] **nexthop**

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **display ospf nexthop** command to display OSPF next hop information.

If no OSPF process is specified, next hop information of all OSPF processes is displayed.

Examples # Display OSPF next hop information.

```
<Sysname> display ospf nexthop
         OSPF Process 1 with Router ID 192.168.0.1
                 Routing Nexthop Information

  Next Hops:
  Address          Refcount  IntfAddr        Intf Name
 ----------------------------------------------------------------
  192.168.0.1      1         192.168.0.1     Ethernet1/0
  192.168.0.2      1         192.168.0.1     Ethernet1/0
  192.168.1.1      1         192.168.1.1     Ethernet1/1
```

Table 270 Description on the fields of the display ospf nexthop command

Field	Description
Next hops	Information about Next hops
Address	Next hop address
Refcount	Reference count, indicating the number of routes using the nexthop
IntfAddr	Outbound interface address
Intf Name	Outbound interface name

display ospf peer

Syntax **display ospf** [*process-id*] **peer** [**verbose** | [*interface-type interface-number*] [*neighbor-id*]]

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

verbose: Displays detailed neighbor information.

interface-type interface-number: Interface type and number

neighbor-id: Neighbor router ID.

Description Use the **display ospf peer** command to display information about OSPF neighbors.

Note that:

If no OSPF process is specified, OSPF neighbor information of all OSPF processes is displayed.

If an interface is specified, the neighbor on the interface is displayed.

If a neighbor ID is specified, detailed information about the neighbor is displayed,

If neither interface nor neighbor ID is specified, brief information about neighbors of the specified OSPF process or all OSPF process is displayed.

Examples # Display detailed OSPF neighbor information.

```
<Sysname> display ospf peer verbose

          OSPF Process 1 with Router ID 1.1.1.1
                  Neighbors
 Area 0.0.0.0 interface 1.1.1.1(Ethernet0/1/0)'s neighbors
 Router ID: 1.1.1.2          Address: 1.1.1.2          GR State: Normal
   State: Full  Mode: Nbr is Master  Priority: 1
   DR: 1.1.1.2  BDR: 1.1.1.1  MTU: 0
   Dead timer due in 33  sec
   Neighbor is up for 02:03:35
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
```

Table 271 Description on the fields of the display ospf peer verbose command

Field	Description
Area	Area of the neighbor
Interface	Interface connected to neighbor
Router ID	Neighbor router ID
Address	Neighbor router address
GR State	GR state

Table 271 Description on the fields of the display ospf peer verbose command

Field	Description
State	Neighbor state: Down, Init, Attempt, 2-Way, Exstart, Exchange, Loading or Full
Mode	Neighbor mode for DD exchange: Master or Slave
Priority	Router priority
DR	The DR on the interface's network segment
BDR	The BDR on the interface's network segment
MTU	Interface MTU
Dead timer due in 33 sec	Dead timer times out in 33 seconds
Neighbor is up for 93:12:38	The neighbor has been up for 93:12:38
Authentication Sequence	Authentication sequence number
Neighbor state change count	Counts of neighbor state changes

Display brief OSPF neighbor information.

```
<Sysname> display ospf peer

                  OSPF Process 1 with Router ID 1.1.1.1
                       Neighbor Brief Information

 Area: 0.0.0.0
 Router ID       Address         Pri Dead-Time Interface       State
 1.1.1.2         1.1.1.2         1   40        Eth0/1/0        Full/DR
```

Table 272 Description on the fields of the display ospf peer command

Field	Description
Area	Area of neighbors
Router ID	Neighbor router ID
Address	Neighbor interface address
Pri	Router priority
Dead time	Dead interval remained
Interface	The Interface connected to neighbors
State	Neighbor state: Down, Init, Attempt, 2-Way, Exstart, Exchange, Loading or Full

display ospf peer statistics

Syntax **display ospf** [*process-id*] **peer statistics**

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **display ospf peer statistics** command to display OSPF neighbor statistics.

If no OSPF process is specified, OSPF neighbor statistics of all OSPF processes is displayed.

Examples # Display OSPF neighbor statistics.

```
<Sysname> display ospf peer statistics
                  OSPF Process 1 with Router ID 1.1.1.1
                           Neighbor Statistics

Area ID       Down  Attempt Init 2-Way ExStart Exchange Loading Full Total
0.0.0.1       0      0          0     0     0        0          0        1     1
Total         0      0          0     0     0        0          0        1     1
```

Table 273 Description on the fields of the display ospf peer statistics command

Field	Description
Area ID	Area ID
Down	Under this state, neighbor initial state, the router has not received any information from a neighboring router for a period of time.
Attempt	Available only in an NBMA network, such as Frame Relay, X.25 or ATM. Under this state, the OSPF router has not received any information from a neighbor for a period but can send Hello packets with a longer interval to keep neighbor relationship.
Init	Under this state, the router received a Hello packet from a neighbor but the packet gives no ID of the router, mutual communication is not available.
2-Way	Indicates mutual communication between the router and its neighbor is available. DR/BDR election finished under this state (or higher).
ExStart	Under this state, the router decides on sequence numbers for DD packets.
Exchange	Under this state, the router exchanges routing information with the neighbor.
Loading	Under this state, the router requests the neighbor for needed LSAs.
Full	Indicates LSDB synchronization has been accomplished between neighbors.
Total	Total number of neighbors under the same state

display ospf request-queue

Syntax **display ospf** [*process-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

interface-type interface-number: Interface type and number.

neighbor-id: Neighbor's router ID.

Description Use the **display ospf request-queue** command to display OSPF request list information.

If no OSPF process is specified, OSPF request list information of all OSPF processes is displayed.

Examples # Display OSPF request list information.

```
<Sysname> display ospf request-queue

         OSPF Process 1 with Router ID 1.1.1.1
                 OSPF Request List

 The Router's Neighbor is Router ID 2.2.2.2         Address 10.1.1.2
 Interface 10.1.1.1         Area 0.0.0.0
 Request list:
      Type       LinkState ID      AdvRouter         Sequence   Age
      Router     2.2.2.2           1.1.1.1           80000004   1
      Network    192.168.0.1       1.1.1.1            80000003   1
      Sum-Net    192.168.1.0       1.1.1.1            80000002   2
```

Table 274 Description on the fields of the display ospf request queue command

Field	Description
The Router's Neighbor is Router ID	Neighbor router ID
Address	Neighbor interface IP address
Interface	Local interface IP address
Area	Area ID
Request list	Request list information
Type	LSA type
LinkState ID	Link state ID
AdvRouter	Router ID of the advertising router
Sequence	LSA sequence number
Age	LSA age time

display ospf retrans-queue

Syntax **display ospf** [*process-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

interface-type interface-number: Specifies an interface.

neighbor-id: Neighbor's router ID.

Description Use the **display ospf retrans-queue** command to display retransmit list information.

If no OSPF process is specified, retransmit list information of all OSPF processes is displayed.

Examples # Display OSPF retransmit list information.

```
<Sysname> display ospf retrans-queue

         OSPF Process 1 with Router ID 1.1.1.1
                 OSPF Retransmit List
```

```
The Router's Neighbor is Router ID 2.2.2.2         Address 10.1.1.2
Interface 10.1.1.1         Area 0.0.0.0
Retransmit list:
     Type       LinkState ID      AdvRouter         Sequence   Age
     Router     2.2.2.2           2.2.2.2           80000004   1
     Network    12.18.0.1         2.2.2.2            80000003   1
     Sum-Net    12.18.1.0         2.2.2.2            80000002   2
```

Table 275 Description on the fields of the display ospf retrans-queue command

Field	Description
The Router's Neighbor is Router ID	Neighbor router ID
Address	Neighbor interface IP address
Interface	Interface address of the router
Area	Area ID
Retrans List	Retransmit list
Type	LSA type
LinkState ID	Link state ID
AdvRouter	Router ID of the advertising router
Sequence	LSA sequence number
Age	LSA age time

display ospf routing

Syntax **display ospf** [*process-id*] **routing** [**interface** *interface-type interface-number*] [**nexthop** *nexthop-address*]

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

interface *interface-type interface-number*: Specifies an interface via which to display routing information advertised.

nexthop *nexthop-address*: Displays routing information with the specified next hop.

Description Use the **display ospf routing** command to display routing table information.

If no OSPF process is specified, routing table information of all OSPF processes is displayed.

Examples # Display OSPF routing table information.

```
<Sysname> display ospf routing

          OSPF Process 1 with Router ID 192.168.1.2
                  Routing Tables

 Routing for Network
 Destination        Cost  Type       NextHop         AdvRouter     Area

 172.16.0.0/16      1563  Inter      192.168.1.1     192.168.1.1   0.0.0.0
```

```
Total Nets: 2
Intra Area: 1  Inter Area: 1  ASE: 0  NSSA: 0
```

Table 276 Description on the fields of the display ospf routing command

Field	Description
Destination	Destination network
Cost	Cost to destination
Type	Route type: intra-area, Transit, stub, Inter-area, Type1 External, Type2 External.
NextHop	Next hop address
AdvRouter	Advertising router
Area	Area ID
Total Nets	Total routes
Intra Area	Total intra-area routes
Inter Area	Total inter-area routes
ASE	Total ASE routes
NSSA	Total NSSA routes

display ospf vlink

Syntax **display ospf** [*process-id*] **vlink**

View Any view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **display ospf vlink** command to display OSPF virtual link information.

If no OSPF process is specified, the OSPF virtual link information of all OSPF processes is displayed.

Examples # Display OSPF virtual link information.

```
<Sysname> display ospf vlink
          OSPF Process 1 with Router ID 3.3.3.3
                  Virtual Links

 Virtual-link Neighbor-ID  -> 2.2.2.2, Neighbor-State: Full
 Interface: 10.1.2.1 (Serial2/0)
 Cost: 1562  State: P-2-P  Type: Virtual
 Transit Area: 0.0.0.1
 Timers: Hello 10 , Dead 40 , Retransmit 5 , Transmit Delay 1
```

Table 277 Description on the fields of the display ospf vlink command

Field	Description
Virtual-link Neighbor-id	ID of neighbor connected to the router via the virtual link
Neighbor-State	Neighbor State: Down, Attempt, Init, 2-Way, ExStart, Exchange, Loading, Full.
Interface	Local interface's IP address and name of the virtual link

Table 277 Description on the fields of the display ospf vlink command

Field	Description
Cost	Interface route cost
State	Interface state
Type	Type: virtual link
Transit Area	Transit area ID if the interface attached to a virtual link
Timers	Values of timers: Hello, Dead, Poll (NBMA), Retransmit, and Interface transmit delay

enable link-local-signaling

Syntax **enable link-local-signaling**

undo enable link-local-signaling

View OSPF view

Parameters None

Description Use the **enable link-local-signaling** command to enable the OSPF link-local signaling (LLC) capability.

Use the **undo enable link-local-signaling** command to disable the OSPF link-local signaling capability.

By default, this capability is disabled.

Examples # Enable link-local signaling for OSPF process 1.

```
<Sysname> system-view
[Sysname] ospf 1
[Sysname-ospf-1] enable link-local-signaling
```

enable log

Syntax **enable log** [**config** | **error** | **state**]

undo enable log [**config** | **error** | **state**]

View OSPF view

Parameters **config**: Enables configuration logging.

error: Enables error logging.

state: Enables state logging.

Description Use the **enable** command to enable specified OSPF logging.

Use the **undo enable** command to disable specified logging.

OSPF logging is disabled by default.

If no keyword is specified, all logging is enabled.

Examples # Enable OSPF logging.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] enable log
```

enable out-of-band-resynchronization

Syntax **enable out-of-band-resynchronization**

undo enable out-of-band-resynchronization

View OSPF view

Parameters None

Description Use the **enable out-of-band-resynchronization** command to enable the OSPF out-of-band resynchronization (OOB-Resynch) capability.

Use the **undo enable out-of-band-resynchronization** command to disable the OSPF out-of-band resynchronization capability.

By default, the capability is disabled.

Examples # Enable the out-of-band resynchronization capability for OSPF process 1.

```
<Sysname> system-view
[Sysname] ospf 1
[Sysname-ospf-1] enable link-local-signaling
[Sysname-ospf-1] enable out-of-band-resynchronization
```

filter import/export

Syntax **filter** { *acl-number* | **ip-prefix** *ip-prefix-name* } { **import** | **export** }

undo filter { **import** | **export** }

View OSPF area view

Parameters *acl-number*: ACL number, in the range 2000 to 3999.

ip-prefix-name: IP address prefix list name, a string of up to 19 characters.

import: Filters imported LSAs.

export: Filters exported LSAs.

Description Use the **filter** command to configure exported/imported Summary LSAs filtering on an ABR.

Use the **undo filter** command to disable Summary LSA filtering.

By default, Summary LSAs filtering is disabled.

This command is only available on an ABR.

Examples # Apply IP prefix list **my-prefix-list** to filter inbound Type-3 LSAs, and ACL 2000 to filter outbound Type-3 LSAs in OSPF area 1.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] filter ip-prefix my-prefix-list import
[Sysname-ospf-100-area-0.0.0.1] filter 2000 export
```

filter-policy export (OSPF view)

Syntax **filter-policy** { *acl-number* | **ip-prefix** *ip-prefix-name* } **export** [*protocol* [*process-id*]]

undo filter-policy export [*protocol* [*process-id*]]

View OSPF view

Parameters *acl-number*: Number of the basic or advanced ACL used to filter routing information by destination address, in the range 2000 to 3999.

ip-prefix-name: Name of the ip-prefix list used to filter routing information by destination address, a string of up to 19 characters.

protocol: Specifies a protocol from which to filter redistributed routes. Protocols include **direct**, **static**, **rip**, **ospf**, **isis** or **bgp**. If no protocol is specified, all redistributed routes are filtered.

process-id: Process ID, which is required when the *protocol* is **rip**, **ospf** or **isis**, in the range 1 to 65535.

Description Use the **filter-policy export** command to configure route redistribution filtering.

Use the **undo filter-policy export** command to disable route redistribution filtering.

By default, route redistribution is disabled.

You can use this command to filter redistributed routes as needed.

Related commands: **import-route (OSPF view)**.

Examples # Filter redistributed routes using ACL 2000.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] filter-policy 2000 export
```

filter-policy import (OSPF view)

Syntax **filter-policy** { *acl-number* | **ip-prefix** *ip-prefix-name* | **gateway** *ip-prefix-name* } **import**

undo filter-policy import

View OSPF view

Parameters *acl-number*: Number of the basic or advanced ACL used to filter routing information by destination address, in the range 2000 to 3999.

ip-prefix-name: Name of an IP address prefix list used to filter received routes, a string of up to 19 characters.

gateway *ip-prefix-name*: Name of an IP address prefix list used to filter routes received from the specified neighbors, a string of up to 19 characters.

Description Use the **filter-policy import** command to configure the filtering of incoming routes.

Use the **undo filter-policy import** command to disable the filtering.

By default, no filtering of incoming routes is configured.

Examples # Filter received routes using ACL 2000.

```
<Sysname> system-view
[Sysname] acl number 2000
[Sysname-acl-basic-2000] rule permit source 192.168.10.0 0.0.0.255
[Sysname-acl-basic-2000] quit
[Sysname] ospf 100
[Sysname-ospf-100] filter-policy 2000 import
```

graceful-restart (OSPF view)

Syntax **graceful-restart** [**nonstandard** | **ietf**]

undo graceful-restart

View OSPF view

Parameters **nonstandard**: Enables the non-IETF GR capability.

ietf: Enables the IETF GR capability.

Description Use the **graceful-restart** command to enable the OSPF Graceful Restart capability.

Use the **undo graceful-restart** command to disable the OSPF Graceful Restart capability.

By default, the OSPF Graceful Restart capability is disabled.

Note the following:

- Enable Opaque LSA advertisement and reception with the **opaque-capability enable** command before enabling the IETF GR capability for OSPF.
- Before enabling the non-IETF GR capability for OSPF, enable OSPF LLS (link local signaling) with the **enable link-local-signaling** command and OOB (out of band resynchronization) with the **enable out-of-band-resynchronization** command.
- If the keywords **nonstandard** and **ietf** are not specified when OSPF GR is enabled, **nonstandard** is the default.

Related commands: **enable link-local-signaling**, **enable out-of-band-resynchronization**, **opaque-capability enable**.

Examples # Enable IETF Graceful Restart for OSPF process 1.

```
<Sysname> system-view
[Sysname] ospf 1
[Sysname-ospf-1] opaque-capability enable
[Sysname-ospf-1] graceful-restart ietf
```

Enable non-IETF Graceful Restart for OSPF process 1.

```
<Sysname> system-view
[Sysname] ospf 1
[Sysname-ospf-1] enable link-local-signaling
[Sysname-ospf-1] enable out-of-band-resynchronization
[Sysname-ospf-1] graceful-restart nonstandard
```

graceful-restart help

Syntax **graceful-restart help** { *acl-number* | **prefix** *prefix-list* }

View OSPF view

Parameters *acl-number*: Basic or advanced ACL number, in the range 2000 to 3999.

prefix-list: Name of the specified IP prefix list, a string of 1 to 19 characters.

Description Use the **graceful-restart help** command to configure for which OSPF neighbors the current router can serve as a GR Helper. (The neighbors are specified by the ACL or the IP prefix list.)

By default, the router can serve as a GR Helper for any OSPF neighbor.

Examples # Enable GR Help for OSPF process 1 and configure the router as a GR Helper for OSPF neighbors defined in the ACL 2001.

```
<Sysname> system-view
[Sysname] ospf 1
[Sysname-ospf-1] graceful-restart help 2001
```

graceful-restart interval (OSPF view)

Syntax **graceful-restart interval** *interval-value*

undo graceful-restart interval

View OSPF view

Parameters *interval-value*: Specifies the Graceful Restart interval, in the range 40 to 1,800 seconds.

Description Use the **graceful-restart interval** command to configure the Graceful Restart interval.

Use the **undo graceful-restart interval** command to restore the default Graceful Restart interval.

By default, the Graceful Restart interval is 120 seconds.

Note that the Graceful Restart interval of OSPF cannot be less than the maximum value of dead intervals on all OSPF interfaces; otherwise, the Graceful Restart of OSPF may fail.

Related commands: **ospf timer dead**.

Examples # Configure the Graceful Restart interval for OSPF process 1 as 100 seconds.

```
<Sysname> system-view
[Sysname] ospf 1
[Sysname-ospf-1] graceful-restart interval 100
```

host-advertise

Syntax **host-advertise** *ip-address cost*

undo host-advertise *ip-address*

View OSPF area view

Parameters *ip-address*: IP address of a host

cost: Cost of the route, in the range 1 to 65535.

Description Use the **host-advertise** command to advertise a host route.

Use the **undo host-advertise** command to remove a host route.

No host route is configured by default.

Examples # Configure host route 1.1.1.1 and specify cost 100 for it.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname] area 0
[Sysname-ospf-100-area-0.0.0.0] host-advertise 1.1.1.1 100
```

import-route (OSPF view)

Syntax **import-route** *protocol* [*process-id* | **allow-ibgp**] [**cost** *cost* | **type** *type* | **tag** *tag* | **route-policy** *route-policy-name*]*

undo import-route *protocol* [*process-id*]

View OSPF view

Parameters *protocol*: Redistributes routes from the specified protocol, which can be **bgp**, **direct**, **isis**, **ospf**, **rip**, or **static**.

process-id: Process ID, in the range 1 to 65535. The default is 1. It is available only when the *protocol* is **rip**, **ospf**, or **isis**.

allow-ibgp: Allows to redistribute IBGP routes; optional only when the *protocol* is bgp.

cost *cost*: Specifies route cost, in the range 0 to 16777214, which defaults to 1.

type *type*: Specifies cost type, 1 or 2, which defaults to 2.

tag *tag* : Specifies for external LSAs the tag, in the range 0 to 4294967295, which defaults to 1.

route-policy *route-policy-name*: Specifies a route policy to redistribute qualified routes only. *route-policy-name* is a string of up to 19 characters.

Description Use the **import-route** command to redistribute routes from another routing protocol.

Use the **undo import-route** command to disable route redistribution from a routing protocol.

No route redistribution is configured by default.

OSPF prioritize routes as follows:

- Intra-area route
- Inter-area route
- Type1 External route
- Type2 External route

An intra-area route is a route in an OSPF area. An inter-area route is between any two OSPF areas. Both of them are internal routes.

An external route is to a destination outside the OSPF AS.

A Type-1 external route is an IGP route, such as RIP or STATIC, which has high reliability and whose cost is comparable with the cost of OSPF internal routes. Therefore, the cost from an OSPF router to a Type-1 external route's destination equals the cost from the router to the corresponding ASBR plus the cost from the ASBR to the external route's destination.

A Type-2 external route is an EGP route, which has low credibility, so OSPF considers the cost from ASBR to a Type-2 external route is much bigger than the cost from the ASBR to an OSPF internal router. Therefore, the cost from an internal router to a Type-2 external route's destination equals the cost from the ASBR to the Type-2 external route's destination.

Related commands: **default-route-advertise (OSPF view)**.

- *The import-route command cannot redistribute **default** routes.*
- *Use the import-route bgp allow-ibgp command with care, because it redistributes both EBGP and IBGP routes that may cause routing loops.*

Examples # Redistribute routes from RIP process 40 and specify the type as type2, tag as 33, and cost as 50 for redistributed routes.

```
<Sysname> system-view
[Sysname> ospf 100
[Sysname-ospf-100] import-route rip 40 type 2 tag 33 cost 50
```

log-peer-change

Syntax **log-peer-change**

undo log-peer-change

View OSPF view

Parameters None

Description Use the **log-peer-change** command to enable the logging of OSPF neighbor state changes.

Use the **undo log-peer-change** command to disable the logging.

The logging is enabled by default.

With this feature enabled, information about neighbor state changes is displayed on the terminal until the feature is disabled.

Examples # Disable the logging of neighbor state changes for OSPF process 100.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] undo log-peer-change
```

lsa-arrival-interval

Syntax **lsa-arrival-interval** *interval*

undo lsa-arrival-interval

View OSPF view

Parameters *interval*: Specifies the minimum interval between two received identical LSAs in milliseconds, in the range 0 to 60000.

Description Use the **lsa-arrival-interval** command to specify the minimum interval between two identical received LSAs.

Use the **undo lsa-arrival-interval** command to restore the default.

The interval defaults to 1000 milliseconds.

If an LSA that has the same LSA type, LS ID, originating router ID with the previous LSA is received within the interval, the LSA will be discarded. This feature helps you protect routers and bandwidth from being over-consumed due to frequent network changes.

It is recommended the interval set by the **lsa-arrival-interval** command is smaller or equal to the initial interval set by the **lsa-generation-interval** command.

Related commands: **lsa-generation-interval**.

Examples # Set the LSA minimum repeat arrival interval to 200 milliseconds.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] lsa-arrival-interval 200
```

lsa-generation-interval

Syntax **lsa-generation-interval** *maximum-interval* [*initial-interval* [*incremental-interval*]]

undo lsa-generation-interval

View OSPF view

Parameters *maximum-interval*: Maximum LSA generation interval in seconds, in the range 1 to 60.

initial-interval: Minimum LSA generation interval in milliseconds, in the range 10 to 60000. The default is 0 millisecond.

incremental-interval: LSA generation incremental interval in milliseconds, in the range 10 to 60000, which defaults to 5000 milliseconds.

Description Use the **lsa-generation-interval** command to configure the OSPF LSA generation interval.

Use the **undo lsa-generation-interval** command to restore the default.

The LSA generation interval defaults to 5 seconds.

With this command configured, when network changes are not frequent, an LSA is generated at the *initial-interval*. If network changes become frequent, LSA generation interval is incremented by a specified value each time a generation happens, up to the *maximum-interval*.

Related commands: **lsa-arrival-interval**.

Examples # Configure the LSA generation maximum interval as 2 seconds, minimum interval as 100 milliseconds and incremental interval as 100 milliseconds.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] lsa-generation-interval 2 100 100
```

lsdb-overflow-limit

Syntax **lsdb-overflow-limit** *number*

undo lsdb-overflow-limit

View OSPF view

Parameters *number*: Specifies the upper limit of external LSAs in the LSDB, in the range 1 to 1000000.

Description Use the **lsdb-overflow-limit** command to specify the upper limit of external LSAs in the LSDB.

Use the **undo lsdb-overflow-limit** command to cancel limitation.

External LSAs in the LSDB are unlimited by default.

Examples # Specify the upper limit of external LSAs as 400000.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] lsdb-overflow-limit 400000
```

maximum load-balancing (OSPF view)

Syntax **maximum load-balancing** *maximum*

undo maximum load-balancing

View OSPF view

Parameters *maximum*: Maximum number of load-balanced routes, in the range 1 to 8. A maximum of 1 means no load balancing is enabled.

Description Use the **maximum load-balancing** command to specify the maximum number of load-balanced routes.

Use the **undo maximum load-balancing** command to restore the default.

Examples # Specify the maximum number of load-balanced routes as 2.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] maximum load-balancing 2
```

maximum-routes

Syntax **maximum-routes** { **external** | **inter** | **intra** } *number*

undo maximum-routes { **external** | **inter** | **intra** }

View OSPF view

Parameters **external**: Specifies the maximum number of external routes.

inter: Specifies the maximum number of inter-area routes.

intra: Specifies the maximum number of intra-area routes.

number: Maximum route number in the range 1 to 10000.

Description Use the **maximum-routes** command to specify the maximum route number of a specified type: inter-area, intra-area, external.

Use the **undo maximum-routes** command to restore the default route maximum value of a specified type.

Examples # Specify the maximum number of intra-area routes as 500.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] maximum-routes intra 500
```

network (OSPF area view)

Syntax **network** *ip-address wildcard-mask*

undo network *ip-address wildcard-mask*

View OSPF area view

Parameters *ip-address*: IP address of a network

wildcard-mask: Wildcard mask of the IP address. For example, the wildcard mask for the subnet mask 255.0.0.0 is 0.255.255.255.

Description Use the **network** command to enable OSPF on the interface attached to the specified network in the area.

Use the **undo network** command to disable OSPF on an interface.

By default, an interface neither belongs to any area nor runs OSPF.

You can configure one or multiple interfaces in an area to run OSPF. Note that the interface's primary IP address must fall into the specified network segment to make the interface run OSPF. If only the interface's secondary IP address falls into the network segment, the interface cannot run OSPF.

Related commands: **ospf**.

Examples # Specify the interface whose primary IP address falls into 131.108.20.0/24 to run OSPF in Area 2.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 2
[Sysname-ospf-100-area-0.0.0.2] network 131.108.20.0 0.0.0.255
```

nssa

Syntax **nssa** [**default-route-advertise** | **no-import-route** | **no-summary**]*

undo nssa

View OSPF area view

Parameters **default-route-advertise**: Usable on an NSSA ABR or an ASBR only. If it is configured on an NSSA ABR, the ABR generates a default route in a Type-7 LSA into the NSSA regardless of whether the default route is available. If it is configured on an ASBR, only a default route is available on the ASBR can it generates the default route in a Type-7 LSA into the attached area.

no-import-route: Usable only on an NSSA ABR that is also the ASBR of the OSPF routing domain to disable redistributing routes in Type7 LSAs into the NSSA area, making sure that routes can be redistributed correctly.

no-summary: Usable only on an NSSA ABR to advertise only a default route in a Type-3 summary LSA into the NSSA area. In this way, all the other summary LSAs are not advertised into the area. Such an area is known as an NSSA totally stub area.

Description Use the **nssa** command to configure the current area as an NSSA area.

Use the **undo nssa** command to restore the default.

By default, no NSSA area is configured.

All routers attached to an NSSA area must be configured with the **nssa** command in area view.

Related commands: **default-cost (OSPF area view)**.

Examples # Configure area1 as an NSSA area.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] nssa
```

opaque-capability enable

Syntax **opaque-capability enable**

undo opaque-capability

View OSPF view

Parameters None

Description Use the **opaque-capability enable** command to enable Opaque LSA advertisement and reception. With the command configured, the OSPF device can receive and advertise the Type 9, Type 10 and Type 11 opaque LSAs.

Use the **undo opaque-capability** command to restore the default.

The feature is disabled by default.

Examples # Enable advertising and receiving opaque LSAs.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100]opaque-capability enable
```

ospf

Syntax **ospf** [*process-id* | **router-id** *router-id* | **vpn-instance** *instance-name*]*

undo ospf *process-id*

View System view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

router-id: OSPF router ID, in dotted decimal format.

instance-name: VPN instance name, a string of 1 to 31 case-sensitive characters.

Description Use the **ospf** command to enable an OSPF process.

Use the **undo ospf** command to disable an OSPF process.

No OSPF process is enabled by default.

You can enable multiple OSPF processes on a router and specify different Router IDs for these processes.

When using OSPF as the IGP for MPLS VPN implementation, you need to bind the OSPF process with a VPN instance.

Enabling OSPF first is required before performing other tasks.

Examples # Enable OSPF process 100 and specify Router ID as 10.10.10.1.

```
<Sysname> system-view
[Sysname] ospf 100 router-id 10.10.10.1
[Sysname-ospf-100]
```

ospf authentication-mode

Syntax For MD5/HMAC-MD5 authentication:

ospf authentication-mode { **md5** | **hmac-md5** } *key-id* [**plain** | **cipher**] *password*

undo ospf authentication-mode { **md5** | **hmac-md5** } *key-id*

For simple authentication:

ospf authentication-mode simple [**plain** | **cipher**] *password*

undo ospf authentication-mode simple

View Interface view

Parameters **md5**: MD5 authentication.

hmac-md5: HMAC-MD5 authentication.

simple: Simple authentication.

key-id: Authentication key ID, in the range 1 to 255.

plain | cipher : Plain or cipher password. If plain is specified, only plain password is supported and displayed upon displaying the configuration file. If cipher is specified, both plain and cipher are supported, but only cipher password is displayed when displaying the configuration file. If no keyword is specified, the cipher type is the default for the MD5/HMAC-MD5 authentication mode, and the plain type is the default for the simple authentication mode.

password: Password of plain or cipher. Simple authentication: For plain type password, a plain password is a string of up to 8 characters. For cipher type password, a plain password is a string of up to 8 characters, and a cipher password is a string of up to 24 characters. MD5/HMAC-MD5 authentication: For plain type password, a plain password is a string of up to 16 characters. For cipher type password, a plain password is a string of up to 16 characters, and a cipher password is a string of up to 24 characters.

Description Use the **ospf authentication-mode** command to set the authentication mode and key ID on an interface.

Use the **undo ospf authentication-mode** command to remove specified configuration.

By default, no authentication is available on an interface.

Interfaces attached to the same network segment must have the same authentication password and mode.

This configuration is not supported on the NULL interface.

Related commands: **authentication-mode**.

Examples # Configure the network 131.119.0.0/16 in area1 to support MD5 cipher authentication, and set the interface key ID to 15, authentication password to **abc**, and password type to cipher.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
```

```
[Sysname-ospf-100-area-0.0.0.1] network 131.119.0.0 0.0.255.255
[Sysname-ospf-100-area-0.0.0.1] authentication-mode md5
[Sysname-ospf-100-area-0.0.0.1] quit
[Sysname-ospf-100] quit
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ospf authentication-mode md5 15 cipher abc
```

Configure the network 131.119.0.0/16 in area1 to support simple authentication, and set for the interface the authentication password to **abc**, and password type to cipher.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] network 131.119.0.0 0.0.255.255
[Sysname-ospf-100-area-0.0.0.1] authentication-mode simple
[Sysname-ospf-100-area-0.0.0.1] quit
[Sysname-ospf-100] quit
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ospf authentication-mode simple cipher abc
```

ospf cost

Syntax **ospf cost** *value*

undo ospf cost

View Interface view

Parameters *value*: Value of OSPF cost, in the range 1 to 65535.

Description Use the **ospf cost** command to set an OSPF cost for the interface.

Use the **undo ospf cost** command to restore the default OSPF cost for the interface.

By default, an OSPF interface calculates its cost with the formula: interface default OSPF cost=100 Mbps/interface bandwidth(Mbps). Default OSPF costs of some interfaces are:

- 1785 for the 56kbps serial interface
- 1562 for the 64kbps serial interface
- 48 for the E1 (2.048Mbps) interface
- 1 for the Ethernet interface

You can use the **ospf cost** command to set an OSPF cost for an interface manually.

This configuration is not supported on the NULL interface.

Examples # Set the OSPF cost for the interface to 65.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] ospf cost 65
```

ospf dr-priority

Syntax **ospf dr-priority** *priority*

undo ospf dr-priority

View Interface view

Parameters *priority*: DR Priority of the interface, in the range 0 to 255.

Description Use the **ospf dr-priority** command to set the priority for DR/BDR election on an interface.

Use the **undo ospf dr-priority** command to restore the default value.

By default, the priority is 1.

The bigger the value is, the higher the priority.

This configuration is not supported on the NULL interface.

Examples # Set the DR priority on the current interface to 8.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ospf dr-priority 8
```

ospf mib-binding

Syntax **ospf mib-binding** *process-id*

undo ospf mib-binding

View System view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **ospf mib-binding** command to bind an OSPF process to MIB operation.

Use the **undo ospf mib-binding** command to restore the default.

By default, MIB operation is bound to the first enabled OSPF process.

Examples # Bind OSPF process 100 to MIB operation.

```
<Sysname> system-view
[Sysname] ospf mib-binding 100
```

Restore the default, that is, bind the first enabled OSPF process to MIB operation

```
<Sysname> system-view
[Sysname] undo ospf mib-binding
```

ospf mtu-enable

Syntax **ospf mtu-enable**

undo ospf mtu-enable

View Interface view

Parameters None

Description Use the **ospf mtu-enable** command to enable an interface to add the real MTU into DD packets.

Use the **undo ospf mtu-enable** command to restore the default.

By default, an interface adds an MTU value of 0 into DD packets, that is, no real MTU is added.

Note that:

- After a virtual link is established via a Virtual-Template or Tunnel, two devices on the link from different vendors may have different MTU values. To make them consistent, set the attached interface's default MTU to 0.
- This configuration is not supported on the NULL interface.

Examples # Enable the interface to add the real MTU value into DD packets.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ospf mtu-enable
```

ospf network-type

Syntax **ospf network-type** { **broadcast** | **nbma** | **p2mp** | **p2p** }

undo ospf network-type

View Interface view

Parameters **broadcast**: Specifies the network type as Broadcast.

nbma: Specifies the network type as NBMA.

p2mp: Specifies the network type as P2MP.

p2p: Specifies the network type as P2P.

Description Use the **ospf network-type** command to set the network type for an OSPF interface.

Use the **undo ospf network-type** command to restore the default network type for an OSPF interface.

By default, the network type of an interface depends on its link layer protocol.

- For Ethernet and FDDI, the default network type is broadcast.
- For ATM, FR, HDLC and X.25, the default network type is NBMA.
- For PPP, LAPB and POS, the default network type is P2P.

Note that:

- If a router on a broadcast network does not support multicast, you can configure the interface's network type as NBMA.
- If an NBMA network is fully meshed, you can configure the network type for interfaces as NBMA. If not, you need to configure the network type as P2MP for two routers having no direct link to exchange routing information through another router.
- When the network type of an interface is NBMA, you need to use the **peer** command to specify a neighbor.
- If only two routers run OSPF on a network segment, you can configure associated interfaces' network type as P2P.

Related commands: **ospf dr-priority**.

This command is not supported on the NULL interface.

Examples # Configure the current interface's network type as NBMA.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] ospf network-type nbma
```

ospf timer dead

Syntax **ospf timer dead** *seconds*

undo ospf timer dead

View Interface view

Parameters *seconds*: Dead interval in seconds, in the range 1 to 2147483647.

Description Use the **ospf timer dead** command to set the dead interval.

Use the **undo ospf timer dead** command to restore the default.

The dead interval defaults to 40s for Broadcast, P2P interfaces and defaults to 120s for P2MP and NBMA interfaces

If an interface receives no hello packet from the neighbor within the dead interval, the interface considers the neighbor down. The dead interval on an interface is at least four times the hello interval. Any two routers attached to the same segment must have the same dead interval.

This configuration is not supported on the NULL interface.

Related commands: **ospf timer hello**.

Examples # Configure the dead interval on the current interface as 60 seconds.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] ospf timer dead 60
```

ospf timer hello

Syntax **ospf timer hello** *seconds*

undo ospf timer hello

View Interface view

Parameters *seconds*: Hello interval in seconds, in the range 1 to 65535.

Description Use the **ospf timer hello** command to set the hello interval on an interface.

Use the **undo ospf timer hello** command to restore the default hello interval on an interface.

The hello interval defaults to 10s for P2P and Broadcast interfaces, and defaults to 30s for P2MP and NBMA interfaces.

The shorter the hello interval is, the faster the topology converges and the more resources are consumed. Make sure the hello interval on two neighboring interfaces is the same.

This configuration is not supported on the NULL interface.

Related commands: **ospf timer dead**.

Examples # Configure the hello interval on the current interface as 20 seconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ospf timer hello 20
```

ospf timer poll

Syntax **ospf timer poll** *seconds*

undo ospf timer poll

View Interface view

Parameters *seconds*: Poll interval in seconds, in the range 1 to 2147483647.

Description Use the **ospf timer poll** command to set the poll interval on an NBMA interface.

Use the **undo ospf timer poll** command to restore the default value.

By default, the poll interval is 120 seconds.

When an NBMA interface finds its neighbor is dead, it will send hello packets at the poll interval.

Note that:

- The poll interval is at least four times the hello interval.
- This configuration is not supported on the NULL interface.

Related commands: **ospf timer hello**.

Examples # Set the poll timer interval on the current interface to 130 seconds.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ospf timer poll 130
```

ospf timer retransmit

Syntax **ospf timer retransmit** *interval*

undo ospf timer retransmit

View Interface view

Parameters *interval*: LSA retransmit timer interval in seconds, in the range 1 to 3600.

Description Use the **ospf timer retransmit** command to set the LSA retransmit interval on an interface.

Use the **undo ospf timer retransmit** command to restore the default.

The interval defaults to 5s.

After sending a LSA, an interface waits for an acknowledgement packet. If the interface receives no acknowledgement when the retransmit interval elapses, it will retransmit the LSA.

The retransmit interval should not be so small to avoid unnecessary retransmissions.

This configuration is not supported on the NULL interface.

Examples # Set the LSA retransmit interval to 8 seconds.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ospf timer retransmit 8
```

ospf trans-delay

Syntax **ospf trans-delay** *seconds*

undo ospf trans-delay

View Interface view

Parameters *seconds*: LSA transmit delay time in seconds, in the range 1 to 3600.

Description Use the **ospf trans-delay** command to set the LSA transmit delay time on an interface.

Use the **undo ospf trans-delay** command to restore the default.

The delay time defaults to 1s.

Each LSA in the LSDB has an age (incremented 1 by a second), but a LSA is not aged out during transmission. It is necessary to add a transmit delay into its age time, which is important for transmission on low speed networks.

This configuration is not supported on the NULL interface.

Examples # Set the LSA transmit delay time to 3 seconds on the current interface.

```
<Sysname> system-view
[Sysname] interface serial2/0
[Sysname-Serial2/0] ospf trans-delay 3
```

peer

Syntax **peer** *ip-address* [**dr-priority** *dr-priority*]

undo peer *ip-address*

View OSPF view

Parameters *ip-address*: Neighbor IP address.

dr-priority: Neighbor DR priority, in the range 0 to 255, the bigger the value, the higher the priority.

Description Use the **peer** command to specify the IP address of an NBMA neighbor, and the DR priority of the neighbor.

Use the **undo peer** command to remove the configuration.

The DR priority of NBMA neighbors defaults to 1.

On an X.25 or Frame Relay network, you can configure mappings to make the network fully meshed (any two routers have a direct link in between), so OSPF can handle DR/BDR election as it does on a broadcast network. However, since routers on the network cannot find neighbors via broadcasting hello packets, you need to specify neighbors and neighbor DR priorities on the routers.

After startup, a router sends a hello packet to neighbors with DR priorities higher than 0. When the DR and BDR are elected, the DR will send hello packets to all neighbors for adjacency establishment.

A router uses the priority set with the **peer** command to determine whether to send a hello packet to the neighbor rather than for DR election. The DR priority set with the **ospf dr-priority** command is used for DR election.

Related commands: **ospf dr-priority**.

Examples # Specify the neighbor IP address 1.1.1.1.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] peer 1.1.1.1
```

preference

Syntax **preference** [**ase**] [**route-policy** *route-policy-name*] *value*

undo preference [**ase**]

View OSPF view

Parameters **ase**: Sets priority for ASE routes. If the keyword is not specified, using the command sets priority for internal routes.

route-policy: Applies a route policy to set priorities for specified routes.

route-policy-name: Rout policy name, a string of 1 to 19 characters.

value: Priority value, in the range 1 to 255. A smaller value has a higher priority.

Description Use the **preference** command to set the priority of OSPF routes.

Use the **undo preference** command to restore the default.

The priority of OSPF internal routes defaults to 10, and the priority of OSPF external routes defaults to 150.

If a routing policy is specified, priorities defined by the routing policy will apply to matched routes, and the priorities set with the **preference** command apply to OSPF routes not matching the routing policy.

A router may run multiple routing protocols. When several routing protocols find routes to the same destination, the router uses the route found by the protocol with the highest priority.

Examples # Set a priority of 150 for OSPF internal routes.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] preference 150
```

reset ospf counters

Syntax **reset ospf** [*process-id*] **counters** [**neighbor** [*interface-type interface-number*] [*router-id*]]

View User view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

neighbor: Clears neighbor statistics on an interface.

interface-type interface-number: Interface type and interface number.

router-id: Neighbor router ID.

Description Use the **reset ospf counters** command to reset OSPF counters. If no OSPF process is specified, counters of all OSPF processes are reset.

Examples # Clear OSPF counters.

```
<Sysname> reset ospf counters
```

reset ospf process

Syntax **reset ospf** [*process-id*] **process**

View User view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **reset ospf process** command to reset all OSPF processes or a specified process.

Using the **reset ospf process** command will:

- Clear all invalid LSAs without waiting for their timeouts
- Make a newly configured Router ID take effect
- Start a new round of DR/BDR election
- Not remove any previous OSPF configurations

The system prompts whether to reset OSPF process upon execution of this command.

Examples # Reset all OSPF processes.

```
<Sysname> reset ospf process
```

reset ospf redistribution

Syntax **reset ospf** [*process-id*] **redistribution**

View User view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

Description Use the **reset ospf redistribution** command to restart route redistribution.

Examples # Restart route redistribution.

```
<Sysname> reset ospf redistribution
```

rfc1583 compatible

Syntax **rfc1583 compatible**

undo rfc1583 compatible

View OSPF view

Parameters None

Description Use the **rfc1583 compatible** command to make routing rules defined in RFC1583 compatible.

Use the **undo rfc1583 compatible** command to disable the function.

By default, RFC1583 routing rules are compatible.

On selecting the best route when multiple AS external LSAs describe routes to the same destination, RFC1583 and RFC2328 have different routing rules.

Examples # Make RFC1583 routing rules compatible.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] rfc1583 compatible
```

silent-interface (OSPF view)

Syntax **silent-interface** { **all** | *interface-type interface-number* }

undo silent-interface { **all** | *interface-type interface-number* }

View OSPF view

Parameters **all**: Disables all interfaces from sending OSPF packet.

interface-type interface-number: Interface type and interface number.

Description Use the **silent-interface** command to disable specified interfaces from sending any OSPF packet.

Use the **undo silent-interface** command to restore the default.

By default, an interface sends OSPF packets.

A disabled interface is a Passive Interface, which cannot send any Hello packet.

To make no routing information obtained by other routers on a network segment, you can use this command to disable the interface from sending OSPF packets.

Examples # Disable an interface from sending OSPF packets.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] silent-interface serial 2/0
```

snmp-agent trap enable ospf

Syntax **snmp-agent trap enable ospf** [*process-id*] [**ifauthfail** | **ifcfgerror** | **ifrxbadpkt** | **ifstatechange** | **iftxretransmit** | **lsdbapproachoverflow** | **lsdboverflow** | **maxagelsa** | **nbrstatechange** | **originatelsa** | **vifcfgerror** | **virifauthfail** | **virifrxbadpkt** | **virifstatechange** | **viriftxretransmit** | **virnbrstatechange**] *

undo snmp-agent trap enable ospf [*process-id*] [**ifauthfail** | **ifcfgerror** | **ifrxbadpkt** | **ifstatechange** | **iftxretransmit** | **lsdbapproachoverflow** | **lsdboverflow** | **maxagelsa** | **nbrstatechange** | **originatelsa** | **vifcfgerror** | **virifauthfail** | **virifrxbadpkt** | **virifstatechange** | **viriftxretransmit** | **virnbrstatechange**] *

View System view

Parameters *process-id*: OSPF process ID, in the range 1 to 65535.

ifauthfail: Interface authentication failure information.

ifcfgerror: Interface configuration error information.

ifrxbadpkt: Information about error packets received.

ifstatechange: Interface state change information.

iftxretransmit: Packet receiving and forwarding information.

lsdbapproachoverflow: Information about cases approaching LSDB overflow.

lsdboverflow: LSDB overflow information.

maxagelsa: LSA max age information.

nbrstatechange: Neighbor state change information.

originatelsa: Information about LSAs originated locally.

vifauthfail: Virtual interface authentication failure information.

vifcfgerror: Virtual interface configuration error information.

virifauthfail: Virtual interface authentication failure information.

virifrxbadpkt: Information about error packets received by virtual interfaces.

virifstatechange: Virtual interface state change information.

viriftxretransmit: Virtual interface packet retransmit information.

virnbrstatechange: Virtual interface neighbor state change information.

Description Use the **snmp-agent trap enable ospf** command to enable the sending of SNMP traps for a specified OSPF process. If no process is specified, the feature is enabled for all processes.

Use the **undo snmp-agent trap enable ospf** command to disable the feature.

By default, this feature is enabled.

Refer to "SNMP Configuration Commands" on page 2329 for related information.

Examples # Enable the sending of SNMP traps for all OSPF processes.

```
<Sysname> system-view
[Sysname] snmp-agent trap enable ospf
```

spf-schedule-interval

Syntax **spf-schedule-interval** *maximum-interval* [*minimum-interval* [*incremental-interval*]]

undo spf-schedule-interval

View OSPF view

Parameters *maximum-interval*: Maximum SPF calculation interval in seconds, in the range 1 to 60.

minimum-interval: Minimum SPF calculation interval in milliseconds, in the range 10 to 60000, which defaults to 0.

incremental-interval: Incremental value for increasing SPF calculation interval in milliseconds, in the range 10 to 60000, which defaults to 5000.

Description Use the **spf-schedule-interval** command to set the OSPF SPF calculation interval.

Use the **undo spf-schedule-interval** command to restore the default.

The interval defaults to 5 seconds.

Based on its LSDB, an OSPF router calculates the shortest path tree with itself being the root, and uses it to determine the next hop to a destination. Through adjusting SPF calculation interval, you can protect bandwidth and router resources from being over-consumed due to frequent network changes.

With this command configured, when network changes are not frequent, SPF calculation applies at the *minimum-interval.* If network changes become frequent, the SPF calculation interval is incremented by the *incremental-interval* each time a calculation happens, up to the *maximum-interval*.

Examples # Configure the SPF calculation maximum interval as 10 seconds, minimum interval as 500 milliseconds and incremental interval as 200 milliseconds.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] spf-schedule-interval 10 500 200
```

stub (OSPF area view)

Syntax **stub** [**no-summary**]

undo stub

View OSPF area view

Parameters **no-summary**: Used only on a stub ABR. With it configured, the ABR advertises only a default route in a Summary LSA into the stub area (Such a stub area is known as a totally stub area).

Description Use the **stub** command to configure an area as a stub area.

Use the **undo stub** command to remove the configuration.

No area is a stub area by default.

To cancel the **no-summary** configuration on an ABR, use the **stub** command again to overwirte the previous configuration.

To configure an area as a stub area, all routers attached to it must be configured with this command.

Related commands: **default-cost (OSPF area view)**.

Examples # Configure area1 as a stub area.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 1
[Sysname-ospf-100-area-0.0.0.1] stub
```

stub-router

Syntax **stub-router**

undo stub-router

View OSPF view

Parameters None

Description Use the **stub-router** command to configure the router as a stub router.

Use the **undo stub-router** command to restore the default.

By default, no router is configured as a stub router.

The router LSAs from the stub router may contain different link type values. A value of 3 means a link to the stub network, so the cost of the link remains unchanged. A value of 1, 2 or 4 means a point-to-point link, a link to a transit network or a virtual link; in such cases, a maximum cost value of 65535 is used. Thus, other neighbors find the links to the stub router have such big costs, they will not send packets to the stub router for forwarding as long as there is a route with a smaller cost.

Examples # Enable a stub-router.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] stub-router
```

vlink-peer (OSPF area view)

Syntax **vlink-peer** *router-id* [**hello** *seconds* | **retransmit** *seconds* | **trans-delay** *seconds* | **dead** *seconds* | **simple** [**plain** | **cipher**] *password* | { **md5** | **hmac-md5** } *key-id* [**plain** | **cipher**] *password*]*

undo vlink-peer *router-id* [**hello** | **retransmit** | **trans-delay** | **dead** | [**simple** | { **md5** | **hmac-md5** } *key-id*]]*

View OSPF area view

Parameters *router-id*: ID of the neighbor router on the virtual link.

hello *seconds*: Hello interval in seconds, in the range 1 to 8192, which defaults to 10 and is identical to the value on its virtual link neighbor.

retransmit *seconds*: Retransmit interval in seconds, in the range 1 to 3600, which defaults to 5.

trans-delay *seconds*: Transmit delay interval in seconds, in the range 1 to 3600, which defaults to 1.

dead *seconds*: Dead interval in seconds, in the range 1 to 32768, which defaults to 40 and is identical to the value on its virtual link neighbor. The dead interval is at least four times the hello interval.

md5: MD5 authentication.

hmac-md5: HMAC-MD5 authentication.

simple: Simple authentication.

key-id: Key ID for MD5 or HMAC-MD5 authentication, in the range 1 to 255.

plain | **cipher**: Plain or cipher type. If plain is specified, only plain password is supported and displayed upon displaying the configuration file. If cipher is specified, both plain and cipher are supported, but only cipher password is displayed when displaying the configuration file. By default, MD5 and HMAC-MD5 support cipher password, and simple authentication supports plain password.

password: Password of plain or cipher. Simple authentication: For plain type, a plain password is a string of up to 8 characters. For cipher type, a plain password is a string of up to 8 characters, and a cipher password is a string of up to 24 characters. MD5/HMAC-MD5 authentication: For plain type, a plain password is a string of up to 16 characters. For cipher type, a plain password is a string of up to 16 characters, and a cipher password is a string of up to 24 characters.

Description Use the **vlink-peer** command to create and configure a virtual link.

Use the **undo vlink-peer** command to remove a virtual link.

As defined in RFC2328, all non-backbone areas must maintain connectivity to the backbone. You can use the **vlink-peer** command to configure a virtual link to connect an area to the backbone.

Note that:

- The smaller the hello interval is, the faster the network converges and the more network resources are consumed.
- A so small retransmission interval will lead to unnecessary retransmissions. A big value is appropriate for a low speed link.
- You need to specify an appropriate transmission delay with the **trans-delay** keyword.

The authentication mode at the non-backbone virtual link end follows the one at the backbone virtual link end. The two authentication modes (MD5 or Simple) are independent, and you can specify neither of them.

Related commands: **authentication-mode**, **display ospf peer**.

Examples # Configure a virtual link with the neighbor router ID 1.1.1.1.

```
<Sysname> system-view
[Sysname] ospf 100
[Sysname-ospf-100] area 2
[Sysname-ospf-100-area-0.0.0.2] vlink-peer 1.1.1.1
```

77 RIP CONFIGURATION COMMANDS

checkzero

Syntax **checkzero**

undo checkzero

View RIP view

Parameters None

Description Use the **checkzero** command to enable the zero field check on RIP-1 messages.

Use the **undo checkzero** command to disable the zero field check.

The zero field check is enabled by default.

After the zero field check is enabled, the router discards RIP-1 messages in which zero fields are non-zero. If all messages are trusty, you can disable this feature to spare the processing time of the CPU.

Examples # Disable the zero field check on RIP-1 messages for RIP process 100.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] undo checkzero
```

default cost (RIP view)

Syntax **default cost** *value*

undo default cost

View RIP view

Parameters *value*: Default metric of redistributed routes, in the range of 0 to 16.

Description Use the **default cost** command to configure the default metric for redistributed routes.

Use the **undo default cost** command to restore the default.

By default, the default metric of redistributed routes is 0.

When you use the **import-route** command to redistribute routes from other protocols without specifying a metric, the metric specified by the **default cost** command applies.

Related commands: **import-route (RIP view)**.

Examples # Set the default metric for redistributed routes to 3.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] default cost 3
```

default-route originate

Syntax **default-route originate cost** *value*

undo default-route originate

View RIP view

Parameters *value*: Cost of the default route, in the range of 1 to 15.

Description Use the **default-route originate cost** command to advertise a default route with the specified metric to RIP neighbors.

Use the **undo default-route originate** command to disable the sending of a default route.

By default, no default route is sent to RIP neighbors.

The RIP router with this feature configured will not receive any default routes from RIP neighbors.

Examples # Send a default route with a metric of 2.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] default-route originate cost 2
```

Disable default route sending.

```
[Sysname-rip-100] undo default-route originate
```

display rip

Syntax **display rip** [*process-id* | **vpn-instance** *vpn-instance-name*]

View Any view

Parameters *process-id*: RIP process number, in the range of 1 to 65535.

vpn-instance *vpn-instance-name*: Specifies a VPN instance name, a string of 1 to 31 characters.

Description Use the **display rip** command to display the current status and configuration information of the specified RIP process.

- If *process-id* is not specified, information about all configured RIP processes is displayed.
- If *vpn-instance-name* is specified, the RIP configuration of the specified VPN instance is displayed.

Examples # Display the current status and configuration information of all configured RIP processes.

```
<Sysname> display rip
  Public VPN-instance name :

    RIP process : 1
       RIP version : 1
       Preference : 100
       Checkzero : Enabled
       Default-cost : 0
       Summary : Enabled
       Hostroutes : Enabled
       Maximum number of balanced paths : 8
       Update time   :   30 sec(s)  Timeout time         :  180 sec(s)
       Suppress time :  120 sec(s)  Garbage-collect time :  120 sec(s)
       TRIP retransmit time :    5 sec(s)
       TRIP response packets retransmit count :   36
       Silent interfaces : None
       Default routes : Disabled
       Verify-source : Enabled
       Networks :
           192.168.1.0
       Configured peers : None
       Triggered updates sent : 0
       Number of routes changes : 0
       Number of replies to queries : 0
```

Table 278 Description on the fields of the display rip command

Field	Description
Public VPN-instance name (or Private VPN-instance name)	The RIP process runs under a public VPN instance/The RIP process runs under a private VPN instance
RIP process	RIP process number
RIP version	RIP version 1 or 2
Preference	RIP route priority
Checkzero	Indicates whether the zero field check is enabled for RIP-1 messages.
Default-cost	Default cost of the redistributed routes
Summary	Indicates whether the routing summarization is enabled
Hostroutes	Indicates whether to receive host routes
Maximum number of balanced paths	Maximum number of load balanced routes
Update time	RIP update interval

Table 278 Description on the fields of the display rip command

Field	Description
Timeout time	RIP timeout time
Suppress time	RIP suppress interval
Garbage-collect time	RIP garbage collection interval
TRIP retransmit time	TRIP retransmit interval for sending update requests and responses
TRIP response packets retransmit count	Maximum retransmit times for update requests and responses
Silent interfaces	Number of silent interfaces, which do not periodically send updates
Default routes	Indicates whether a default route is sent to RIP neighbors
Verify-source	Indicates whether the source IP address is checked on the received RIP routing updates
Networks	Networks enabled with RIP
Configured peers	Configured neighbors
Triggered updates sent	Number of sent triggered updates
Number of routes changes	Number of changed routes in the database
Number of replies to queries	Number of RIP responses

display rip database

Syntax **display rip** *process-id* **database**

View Any view

Parameters *process-id*: RIP process number, in the range of 1 to 65535.

Description Use the **display rip database** command to display the active routes in the RIP database, which are sent in normal RIP routing updates.

Examples # Display the active routes in the database of RIP process 100.

```
<Sysname> display rip 100 database
  10.0.0.0/8, cost 1, ClassfulSumm
  10.0.0.0/24, cost 1, nexthop 10.0.0.1, Rip-interface
  11.0.0.0/8, cost 1, ClassfulSumm
  11.0.0.0/24, cost 1, nexthop 10.0.0.1, Imported
```

Table 279 Description on fields of the display rip database command

Field	Description
X.X.X.X/X	Destination address and subnet mask
cost	Cost of the route
classful-summ	Indicates the route is a RIP summary route.
Nexthop	Address of the next hop
Rip-interface	Routes learnt from a RIP-enabled interface
imported	Routes redistributed from other routing protocols

display rip interface

Syntax **display rip** *process-id* **interface** [*interface-type interface-number*]

View Any view

Parameters *process-id*: RIP process number, in the range of 1 to 65535.

interface-type interface-number: Specifies an interface.

Description Use the **display rip interface** command to display the RIP interface information of the RIP process.

If no interface is specified, information about all RIP interfaces of the RIP process is displayed.

Examples # Display all the interface information of RIP process 1.

```
<Sysname> display rip 1 interface

 Interface-name: Ethernet1/0
        Address/Mask:1.1.1.1/24                MetricIn/Out:0/1   Version: RIPv1
        Split-horizon/Poison-reverse:on/off     Input/Output:on/on
        Current packets number/Maximum packets number: 234/2000
```

Table 280 Description on the fields of the display rip interface command

Field	Description
Interface-name	The name of an interface running RIP.
Address/Mask	The IP address and Mask of the interface.
MetricIn/Out	Additional routing metric added to the incoming and outgoing routes
Version	RIP version running on the interface
Split-horizon	Indicates whether the split-horizon is enabled (ON: enabled, OFF: disabled).
Poison-reverse	Indicates whether the poison-reverse is enabled (ON: enabled, OFF: disabled)
Input/Output	Indicates if the interface is allowed to receiving (Input) or sending (Output) RIP messages (on is allowed, off is not allowed).
Current packets number/Maximum packets number	Packets to be sent/Maximum packets that can be sent on the interface

display rip route

Syntax **display rip** *process-id* **route** [**statistics** | *ip-address* { *mask* | *mask-length* } | **peer** *ip-address*]

View Any view

Parameters *process-id*: RIP process number, in the range of 1 to 65535.

statistics: Displays the route statistics, including total number of routes and number of routes of each neighbor.

ip-address { *mask* | *mask-length* }: Displays route information about a specified IP address.

peer *ip-address*: Displays all routing information learned from a specified neighbor.

Description Use the **display rip route** command to display the routing information of a specified RIP process.

Examples # Display all routing information of RIP process 1.

```
<Sysname> display rip 1 route
 Route Flags: R-RIP, T-TRIP
              P-Permanent, A-Aging, S-Suppressed, G-Garbage-collect
Peer 21.0.0.23 on Ethernet1/0
Destination/Mask    NextHop      Cost     Tag    Flags     Sec
56.0.0.0/8         21.0.0.23      1         0       RA     102
34.0.0.0/8         21.0.0.23      1         0       RA      23
Peer 21.0.0.12 on Ethernet1/0
Destination/Mask    NextHop      Cost     Tag    Flags     Sec
56.0.0.0/8         21.0.0.12      1         0       RA      34
12.0.0.0/8         21.0.0.12      1         0       RA      12
```

Display routing information for network 56.0.0.0/8 of RIP process 1.

```
<Sysname> display rip 1 route 56.0.0.0 8
Route Flags: R-RIP, T-TRIP
             P-Permanent, A-Aging, S-Suppressed, G-Garbage-collect
Peer 21.0.0.23 on Ethernet1/0
Destination/Mask    NextHop      Cost     Tag    Flags     Sec
56.0.0.0/8         21.0.0.23      1         0       RA     102
Peer 21.0.0.12 on Ethernet1/0
Destination/Mask    NextHop      Cost     Tag    Flags     Sec
56.0.0.0/8         21.0.0.12      1         0       RA      34
```

Display RIP process 1 routing information learned from the specified neighbor.

```
<Sysname> display rip 1 route peer 21.0.0.23
Route Flags: R-RIP, T-TRIP
             P-Permanent, A-Aging, S-Suppressed, G-Garbage-collect
Peer 21.0.0.23 on Ethernet1/0
Destination/Mask    NextHop      Cost     Tag    Flags     Sec
56.0.0.0/8         21.0.0.23      1         0       RA        102
34.0.0.0/8         21.0.0.23      1         0       RA        23
```

Table 281 Description on the fields of the display rip route command

Field	Description
Route Flags	R - RIP route
	T - TRIP route
	P - The route never expires
	A - The route is aging
	S - The route is suppressed
	G - The route is in Garbage-collect state
Peer 21.0.0.23 on Ethernet1/0	Routing information learned on a RIP interface from the specified neighbor
Destination/Mask	Destination IP address and subnet mask
Nexthop	Next hop of the route
Cost	Cost of the route
Tag	Route tag
Flags	Indicates the route state
Sec	Remaining time of the timer corresponding to the route state

Display the routing statistics of RIP process 1.

```
<Sysname> display rip 1 route statistics
Peer         Aging     Permanent    Garbage
21.0.0.23      2           0              3
21.0.0.12      2           0              4
Total          4           0              7
```

Table 282 Description on the fields of the display rip route statistics command

Field	Description
Peer	IP address of a neighbor
Aging	Total number of aging routes learned from the specified neighbor
Permanent	Total number of permanent routes learned from the specified neighbor
Garbage	Total number of routes in the garbage-collection state learned from the specified neighbor
Total	Total number of routes learned from all RIP neighbors

filter-policy export (RIP view)

Syntax **filter-policy** { *acl-number* | **ip-prefix** *ip-prefix-name* } **export** [*protocol* [*process-id*]] [*interface-type interface-number*]

undo filter-policy export [*protocol* [*process-id*]] [*interface-type interface-number*]

View RIP view

Parameters *acl-number*: Number of the Access Control List (ACL) used for filtering outbound routes, in the range of 2000 to 3999.

ip-prefix *ip-prefix-name*: Name of the IP prefix list used for filtering outbound routes, a string of 1 to 19 characters.

protocol: Filters outbound routes redistributed from a specified routing protocol, which can be **bgp**, **direct**, **isis**, **ospf**, **rip**, and **static**.

process-id: Process number of the specified routing protocol, in the range of 1 to 65535. You need to specify a process ID when the routing protocol is **rip**, **ospf**, or **isis**.

interface-type interface-number: Specifies an interface.

Description Use the **filter-policy export** command to configure RIP to filer advertised routing information.

Use the **undo filter-policy export** command to cancel the filtering of advertised routing information.

By default, RIP does not filter outbound routes.

Note that:

- If *protocol* is specified, RIP filters only the routes redistributed from the specified routing protocol. Otherwise, RIP filters all routes to be advertised.
- If *interface-type interface-number* is specified, RIP filters only the routes advertised by the specified interface. Otherwise, RIP filters routes advertised by all RIP interfaces.

Related commands: **acl** on page 2087, **import-route (RIP view)**, and **ip ip-prefix on page 1210**.

Examples # Reference ACL 2000 to filter outbound routes.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] filter-policy 2000 export
```

Reference IP prefix list **abc** to filter outbound routes on Ethernet1/0.

```
[Sysname-rip-1] filter-policy ip-prefix abc export static ethernet 1/0
```

filter-policy import (RIP view)

Syntax **filter-policy** { *acl-number* | **gateway** *ip-prefix-name* | **ip-prefix** *ip-prefix-name* [**gateway** *ip-prefix-name*] } **import** [*interface-type interface-number*]

undo filter-policy import [*interface-type interface-number*]

View RIP view

Parameters *acl-number*: Number of the Access Control List (ACL) used for filtering received routes, in the range of 2000 to 3999.

ip-prefix *ip-prefix-name*: References an IP prefix list to filter received routes. The *ip-prefix-name* is a string of 1 to 19 characters.

gateway *ip-prefix-name*: References an IP prefix list to filter routes from the gateway.

interface-type interface-number: Specifies an interface.

Description Use the **filter-policy import** command to configure the filtering of incoming routes.

Use the **undo filter-policy import** command to remove the filtering.

By default, RIP does not filter incoming routes.

Related commands: acl and ip ip-prefix.

Examples # Reference ACL 2000 to filter received routes.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] filter-policy 2000 import
```

Reference IP prefix list **abc** on Ethernet1/1 to filter all received RIP routes.

```
[Sysname-rip-1] filter-policy ip-prefix abc import ethernet 1/1
```

host-route

Syntax **host-route**

undo host-route

View RIP view

Parameters None

Description Use the **host-route** command to enable host route reception.

Use the **undo host-route** command to disable host route reception.

By default, receiving host routes is enabled.

In some cases, a router may receive many host routes from the same network segment. These routes are not helpful for routing and occupy a large amount of network resources. You can use the **undo host-route** command to disable receiving of host routes.

RIPv2 can be disabled from receiving host routes, but RIPv1 cannot.

Examples # Disable RIP from receiving host routes.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] undo host-route
```

import-route (RIP view)

Syntax **import-route** *protocol* [*process-id*] [**allow-jbgp**] [**cost** *cost* | **route-policy** *route-policy-name* | **tag** *tag*]*

undo import-route *protocol* [*process-id*]

View RIP view

Parameters *protocol*: Specify a routing protocol from which to redistribute routes, currently including **bgp**, **direct**, **isis**, **ospf**, **rip**, **rip** and **static**.

process-id: Process number of the routing protocol, in the range of 1 to 65535, used for **isis**, **rip**, and **ospf**.

cost: Cost for redistributed routes, in the range of 0 to 16. If *cost* is not specified, the default cost specified by the **default cost** command applies.

tag: Tag marking redistributed routes, in the range of 0 to 65,535. The default is 0.

route-policy *route-policy-name*: Specifies a routing policy with 1 to 19 characters.

allow-ibgp: When the *protocol* argument is set to **bgp**, **allow-ibgp** is an optional keyword. The **import-route bgp** command only redistributes EBGP routes, while the **import-route bgp allow-ibgp** command additionally redistributes IBGP routes, which may cause routing loops. Be cautious when using it.

Description Use the **import-route** command to redistribute routes from other routing protocols.

Use the **undo import-route** command to cancel route redistribution.

By default, RIP does not redistribute routes from other routing protocols.

- You can specify a routing policy using keyword **route-policy** to redistribute only the specified routes.
- You can configure a cost for redistributed routes using keyword **cost**.
- You can configure a tag value for redistributed routes using keyword **tag**.

Related commands: **default cost (RIP view)**.

Examples # Redistribute static routes, and set the cost to 4.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] import-route static cost 4
```

Set the default cost for redistributed routes to 3.

```
[Sysname-rip-1] default cost 3
```

Redistribute OSPF routes with the cost being the default cost.

```
[Sysname-rip-1] import-route ospf
```

maximum load-balancing (RIP view)

Syntax **maximum load-balancing** *number*

undo maximum load-balancing

View RIP view

Parameters *number*: Maximum number of load balanced routes, in the range 1 to 8.

Description Use the **maximum load-balancing** command to specify the maximum number of load balanced routes.

Use the **undo maximum load-balancing** command to restore the default.

Examples # Specify the maximum number of load balanced routes as 2.

```
<Sysname> system-view
[Sysname] rip
[Sysname-rip-1] maximum load-balancing 2
```

network

Syntax **network** *network-address*

undo network *network-address*

View RIP view

Parameters *network-address*: IP address of a network segment, which can be the IP network address of any interface.

Description Use the **network** command to enable RIP on the interface attached to the specified network.

Use the **undo network** command to disable RIP on the interface attached to the specified network.

RIP runs only on the interfaces attached to the specified network. For an interface not on the specified network, RIP neither receives/sends routes on it nor forwards interface route through it. Therefore, you need to specify the network after enabling RIP to validate RIP on a specific interface.

Use the **network** 0.0.0.0 command to enable RIP on all interfaces.

RIP is disabled on an interface by default.

Examples # Enable RIP on the interface attached to the network 129.102.0.0.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] network 129.102.0.0
```

peer

Syntax **peer** *ip-address*

undo peer *ip-address*

View RIP view

Parameters *ip-address*: RIP peer IP address, in dotted decimal format.

Description Use the **peer** command to specify a neighbor in the non-broadcast multi-access (NBMA) network. With this command used, routing updates destined to the peer are unicast, rather than multicast or broadcast.

Use the **undo peer** command to remove a neighbor.

By default, no neighbor is specified.

In general, it is not recommended to use the **peer** command, because the neighbor may receive both the unicast and multicast (or broadcast) update of the same route. When you need to use the command, configure the mode of related interface as silent.

Examples # Specify to send unicast updates to peer 202.38.165.1.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] peer 202.38.165.1
```

preference

Syntax **preference** [**route-policy** *route-policy-name*] *value*

undo preference [**route-policy**]

View RIP view

Parameters *route-policy-name*: Routing policy name with 1 to 19 characters.

value: Priority for RIP route, in the range of 1 to 255. The smaller the value, the higher the priority.

Description Use the **preference** command to specify the RIP route priority.

Use the **undo preference route-policy** command to restore the default.

By default, the priority of RIP route is 100.

You can specify a routing policy using keyword **route-policy** to set the specified priority to routes matching the routing policy.

- If a priority is set for matched routes in the routing policy, the priority applies to these routes. The priority of other routes is the one set by the **preference** command.
- If no priority is set for matched routes in the routing policy, the priority of all routes is the one set by the **preference** command.

Examples # Set the RIP route priority to 120.

```
<Sysname> system-view
[Sysname] rip 1
[Sysname-rip-1] preference 120
```

reset rip statistics

Syntax **reset rip** *process-id* **statistics**

View User view

Parameters *process-id*: RIP process number, in the range of 1 to 65535.

Description Use the **reset rip statistics** command to clear the statistics of the specified RIP process.

Examples # Clear statistics in RIP process 100.

```
<Sysname> reset rip 100 statistics
```

rip

Syntax **rip** [*process-id*] [**vpn-instance** *vpn-instance-name*]

undo rip [*process-id*] [**vpn-instance** *vpn-instance-name*]

View System view

Parameters *process-id*: RIP process number, in the range of 1 to 65535. The default is 1.

vpn-instance *vpn-instance-name*: Specifies a VPN instance name, a string of 1 to 31 characters.

Description Use the **rip** command to create a RIP process and enter RIP view.

Use the **undo rip** command to disable a RIP process.

By default, no RIP process is enabled.

Note that:

- If no VPN instance is specified, the RIP process will run under public network instance.
- You must create a VPN instance before you apply a RIP process to it. For related configuration, refer to "ip vpn-instance" on page 1696.
- You must create the RIP process before configuring the global parameters. This rule does not apply to interface parameters.
- The configured interface parameters become invalid after you disable the RIP process.

Examples # Create a RIP process and enter rip process view.

```
<Sysname> system-view
[Sysname] rip
[Sysname-rip-1]
```

rip authentication-mode

Syntax **rip authentication-mode** { **md5** { **rfc2082** *key-string key-id* | **rfc2453** *key-string* } | **simple** *password* }

undo rip authentication-mode

View Interface view

Parameters **md5**: MD5 authentication mode.

rfc2453: Uses the message format defined in RFC 2453 (IETF standard).

rfc2082: Uses the message format defined in RFC 2082.

key-id: MD5 key number, in the range of 1 to 255.

key-string: MD5 key string with 1 to 16 characters in plain text format, or 1 to 24 characters in cipher text format. When the **display current-configuration** command is used to display system information, a 24-character cipher string is displayed as the MD5 key string.

simple: Plain text authentication mode.

password: Plain text authentication string with 1 to 16 characters.

Description Use the **rip authentication-mode** command to configure RIP-2 authentication mode and parameters.

Use the **undo rip authentication-mode** command to cancel authentication.

Note that the key string you configured can overwrite the old one if there is any.

Related commands: **rip version**.

With RIPv1, you can configure the authentication mode in interface view. However, the configuration will not take effect because RIPv1 does not support authentication.

Examples # Configure MD5 authentication on Ethernet1/0 with the key string being rose in the format defined in RFC 2453.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] rip version 2
[Sysname-Ethernet1/0] rip authentication-mode md5 rfc2453 rose
```

rip input

Syntax **rip input**

undo rip input

View Interface view

Parameters None

Description Use the **rip input** command to enable the interface to receive RIP messages.

Use the **undo rip input** command to disable the interface from receiving RIP messages.

By default, an interface is enabled to receive RIP messages.

Related commands: **rip output**.

Examples # Enable Ethernet1/0 to receive RIP messages.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] rip input
```

rip metricin

Syntax **rip metricin** *value*

undo rip metricin

View Interface view

Parameters *value*: Additional metric added to received routes, in the range of 0 to 16.

Description Use the **rip metricin** command to add a metric to the received routes.

Use the **undo rip metricin** command to restore the default.

By default, the additional metric of a received route is 0.

When a valid RIP route is received, the system will add a metric to it and then put it into the routing table. Therefore, the metric of routes received on the configured interface is increased.

Related commands: **rip metricout**.

Examples # Configure an additional metric for routes received on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] rip metricin 2
```

rip metricout

Syntax **rip metricout** *value*

undo rip metricout

View Interface view

Parameters *value*: Additional metric for outbound routes, in the range of 1 to 16.

Description Use the **rip metricout** command to add a metric to a sent route.

Use the **undo rip metricout** command to restore the default.

By default, the additional metric for sent routes is 1.

Before a RIP route is sent, a metric will be added to it. Therefore, when the metric is configured on an interface, the metric of RIP routes sent on the interface will be increased.

Related commands: **rip metricin**.

Examples # Configure an additional metric of 12 for RIP routes sent on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] rip metricout 12
```

rip mib-binding

Syntax **rip mib-binding** *process-id*

undo rip mib-binding

View System view

Parameters *process-id*: RIP process number, in the range of 1 to 65535.

Description Use the **rip mib-binding** command to bind MIB operations with a specified RIP process.

Use the **undo rip mib-binding** command to restore the default.

By default, MIB operations are bound to the RIP process with the smallest process ID.

Examples # Configure RIP 100 to accept SNMP requests.

```
<Sysname> system-view
[Sysname] rip mib-binding 100
```

Restore the default.

```
[Sysname] undo rip mib-binding
```

rip output

Syntax **rip output**

undo rip output

View Interface view

Parameters None

Description Use the **rip output** command to enable the interface to send RIP messages.

Use the **undo rip output** command to disable the interface from sending RIP messages.

Sending RIP messages is enabled on an interface by default.

Related commands: **rip input**.

Examples # Enable Serial 2/0 to receive RIP messages.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] rip output
```

rip poison-reverse

Syntax **rip poison-reverse**

undo rip poison-reverse

View Interface view

Parameters None

Description Use the **rip poison-reverse** command to enable the poison reverse function.

Use the **undo rip poison-reverse** command to disable the poison reverse function.

By default, the poison reverse function is disabled.

Examples # Enable the poison reverse function for RIP routing updates on Serial 2/0.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] rip poison-reverse
```

rip split-horizon

Syntax **rip split-horizon**

undo rip split-horizon

View Interface view

Parameters None

Description Use the **rip split-horizon** command to enable the split horizon function.

Use the **undo rip split-horizon** command to disable the split horizon function.

The split horizon function is enabled by default.

- The split horizon function is necessary for preventing routing loops. Therefore, you are not recommended to disable it.

- In special cases, make sure it is necessary to disable the split horizon function.
- In Frame Relay, X.25 and other non-broadcast multi-access (NBMA) networks, split horizon should be disabled if multiple VCs are configured on the primary and secondary interfaces to ensure route advertisement. For detailed information, refer to "Frame Relay Configuration Commands" on page 371 and "LAPB and X.25 Configuration Commands" on page 421.

Only the poison reverse function takes effect if both the split horizon and poison reverse functions are enabled.

Examples # Enable the split horizon function on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] rip split-horizon
```

rip summary-address

Syntax **rip summary-address** *ip-address* { *mask* | *mask-length* }

undo rip summary-address *ip-address* { *mask* | *mask-length* }

View Interface view

Parameters *ip-address*: Summary IP address.

mask: Subnet mask in dotted decimal format.

mask-length: Subnet mask length.

Description Use the **rip summary-address** command to configure RIP-2 to advertise a summary route via the interface.

Use the **undo rip summary-address** command to remove the configuration.

Note that the summary address is valid only when the automatic summarization is disabled.

Related commands: **summary**.

Examples # Advertise a local summary IP address on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] rip summary-address 10.0.0.0 255.255.255.0
```

rip triggered

Syntax **rip triggered**

undo rip triggered

View Interface view

Parameters None

Description Use the **rip triggered** command to enable triggered RIP.

Use the **undo rip triggered** command to disable triggered RIP.

By default, the triggered RIP is disabled.

Note that triggered RIP can only run on link layer protocols PPP, Frame Relay, and X.25.

Examples # Enable triggered RIP.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] rip triggered
```

rip version

Syntax **rip version** { **1** | **2** [**broadcast** | **multicast**] }

undo rip version

View Interface view

Parameters **1**: RIP version 1.

2: RIP version 2.

broadcast: Sends RIP-2 messages in broadcast mode.

multicast: Sends RIP-2 messages in multicast mode.

Description Use the **rip version** command to specify a RIP version for the interface.

Use the **undo rip version** command to remove the specified RIP version.

By default, no RIP version is configured for an interface, which uses the global RIP version. If the global RIP version is not configured, the interface can only send RIP-1 broadcasts and can receive RIP-1 broadcasts and unicasts, and RIP-2 broadcasts, multicasts and unicasts.

If RIP-2 is specified with no sending mode configured, RIP-2 messages will be sent in multicast mode.

When RIP-1 runs on an interface, the interface will:

- Send RIP-1 broadcast messages
- Receive RIP-1 broadcast messages
- Receive RIP-1 unicast messages

When RIP-2 runs on the interface in broadcast mode, the interface will:

- Send RIP-2 broadcast messages
- Receive RIP-1 broadcast messages
- Receive RIP-1 unicast messages
- Receive RIP-2 broadcast messages
- Receive RIP-2 multicast messages
- Receive RIP-2 unicast messages

When RIP-2 runs on the interface in multicast mode, the interface will:

- Send RIP-2 multicast messages
- Receive RIP-2 broadcast messages
- Receive RIP-2 multicast messages
- Receive RIP-2 unicast messages

Examples # Configure Ethernet1/0 to broadcast RIP-2 messages.

```
<Sysname> system-view
[Sysname] interface ethernet1/0
[Sysname-Ethernet1/0] rip version 2 broadcast
```

silent-interface (RIP view)

Syntax **silent-interface** { **all** | *interface-type interface-number* }

undo silent-interface { **all** | *interface-type interface-number* }

View RIP view

Parameters **all**: Silents all interfaces.

interface-type interface-number: Specifies an interface.

Description Use the **silent-interface** command to disable an interface or all interfaces from sending routing updates. That is, the interface only receives but does not send RIP messages.

Use the **undo silent-interface** command to restore the default.

By default, all interfaces are allowed to send routing updates.

Examples # Configure all interfaces to work in the silent mode, and then activate Ethernet1/0.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] silent-interface all
[Sysname-rip-100] undo silent-interface ethernet1/0
[Sysname-rip-100] network 131.108.0.0
```

summary

Syntax **summary**

undo summary

View RIP view

Parameters None

Description Use the **summary** command to enable automatic RIP-2 summarization. Natural masks are used to advertise summary routes so as to reduce the size of routing tables.

Use the **undo summary** command to disable automatic RIP-2 summarization so that all subnet routes can be broadcasted.

By default, automatic RIP-2 summarization is enabled.

Enabling automatic RIP-2 summarization can reduce the size of the routing table to enhance the scalability and efficiency of large networks.

Related commands: **rip version**.

Examples # Enable RIP-2 automatic summarization.

```
<Sysname> system-view
[Sysname] rip
[Sysname-rip-1] summary
```

timers

Syntax **timers** { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* }*

undo timers { **garbage-collect** | **suppress** | **timeout** | **update** } *

View RIP view

Parameters *garbage-collect-value*: Garbage-collect timer time in seconds, in the range of 1 to 3600.

suppress-value: Suppress timer time in seconds, in the range of 0 to 3600.

timeout-value: Timeout timer time in seconds, in the range of 1 to 3,600.

update-value: Update timer time in seconds, in the range of 1 to 3,600.

Description Use the **timers** command to configure RIP timers. By adjusting RIP timers, you can improve network performance.

Use the **undo timers** command to restore the default.

By default, the garbage-collect timer is 120 seconds, the suppress timer 120 seconds, the timeout timer 180 seconds, and the update timer 30 seconds.

RIP is controlled by the above four timers.

- The update timer defines the interval between routing updates.
- The timeout timer defines the route aging time. If no routing update related to a route is received after the aging time, the metric of the route is set to 16 in the routing table.
- The suppress timer defines how long a RIP route stays in the suppressed state. When the metric of a route is 16, the route enters the suppressed state. In the suppressed state, only routes which come from the same neighbor and whose metric is less than 16 will be received by the router to replace unreachable routes.
- The garbage-collect timer defines the interval from when the metric of a route becomes 16 to when it is deleted from the routing table. During the Garbage-Collect timer length, RIP advertises the route with the routing metric set to 16. If no routing update is announced for that route after the Garbage-Collect timer expires, the route will be deleted from the routing table.

Note that:

- Generally, you are not recommended to change the default values of these timers.
- The time lengths of these timers must be kept consistent on all routers and access servers in the network.

Examples # Specifies the update, timeout, suppress, and garbage-collect timers as 5, 15, 15 and 30 respectively.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] timers update 5
[Sysname-rip-100] timers timeout 15
[Sysname-rip-100] timers suppress 15
[Sysname-rip-100] timers garbage-collect 30
```

trip retransmit count

Syntax **trip retransmit count** *retransmit-count-value*

undo trip retransmit count

View RIP view

Parameters *retransmit-count-value:* Upper limit for retransmitting an Update Request or Update Response, in the range 1 to 3600.

Description Use the **trip retransmit count** command to configure the upper limit for retransmitting an Update Request or Update Response.

Use the **undo validate-source-address** command to restore the default.

The default upper limit is 36.

Examples # Configure an upper limit of 20 for retransmitting an Update Request or Update Response.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] trip retransmit count 20
```

trip retransmit timer

Syntax **trip retransmit timer** *retransmit-time-value*

undo trip retransmit timer

View RIP view

Parameters *retransmit-time-value:* Interval in seconds for retransmitting an Update Request or Update Response, in the range 1 to 3600.

Description Use the **trip retransmit timer** command to configure the interval for retransmitting an Update Request or Update Response.

Use the **undo validate-source-address** command to restore the default.

The default interval is 5 seconds.

For two routers on an analog dial-up link, the difference between retransmission intervals on the two ends must be bigger than 50 seconds; otherwise, they can not become TRIP neighbors.

Examples # Configure an interval of 80 seconds for retransmitting an Update Request or Update Response.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] trip retransmit timer 80
```

validate-source-address

Syntax **validate-source-address**

undo validate-source-address

View RIP view

Parameters None

Description Use the **validate-source-address** command to enable the source IP address validation on incoming RIP routing updates.

Use the **undo validate-source-address** command to disable the source IP address validation.

The source IP address validation is enabled by default.

Generally, disabling the validation is not recommended.

Examples # Enable the source IP address validation on incoming messages.

```
<Sysname> system-view
[Sysname-rip] rip 100
[Sysname-rip-100] validate-source-address
```

version

Syntax **version** { **1** | **2** }

undo version

View RIP view

Parameters **1**: Specifies the RIP version as RIP-1.

2: Specifies the RIP version as RIP-2. RIP-2 messages are multicast.

Description Use the **version** command to specify a global RIP version.

Use the **undo version** command to remove the configured global RIP version.

By default, the global RIP version is RIP-1.

Note that:

- If an interface has an RIP version specified, the RIP version takes precedence over the global one.

- If no RIP version is specified for the interface and the global version is RIP-1, the interface inherits RIP-1, and then it can send RIP-1 broadcasts, and receive RIP-1 broadcasts and unicasts.
- If no RIP version is specified for the interface and the global version is RIP-2, the interface inherits RIP-2, and then it can send RIP-2 multicasts, and receive RIP-2 broadcasts, multicasts and unicasts.
- On a ComwareV5 device, you can configure the RIP version in RIP view and in interface view. On a ComwareV3 device, you can only perform such configuration in interface view.
- To enable a ComwareV5 device in the RIP-1 mode to interoperate with a ComwareV3 device in the RIP-2 broadcast mode, you need to use the **undo version** command in RIP view and the **undo rip version** in interface view to remove related RIP version configuration from the ComwareV5 device.
- For a ComwareV5 device, the case that no RIP version is configured is different from the case that RIP-1 is configured. The former one uses the default RIP-1 version that is compatible with RIP-2, but the latter one is not compatible with RIP-2.

Examples # Specify RIP-2 as the global RIP version.

```
<Sysname> system-view
[Sysname] rip 100
[Sysname-rip-100] version 2
```

78 ROUTING POLICY COMMON CONFIGURATION COMMANDS

Routing policy common configuration commands are applicable to both IPv4 and IPv6.

apply as-path

Syntax **apply as-path** *as-number*&<1-10> [**replace**]

undo apply as-path

View Routing policy view

Parameters *as-number*: Autonomous system number, in the range of 1 to 65535.

&<1-10>: Indicates you can enter *as-number* up to 10 times.

replace: Replaces the original AS number.

Description Use the **apply as-path** command to apply the specified AS numbers to BGP routes.

Use the **undo apply as-path** command to remove the clause configuration.

No AS_PATH attribute is set by default.

With the **replace** keyword, using the **apply as-path** command replaces the original AS_PATH attribute with specified AS numbers. Without the **replace** keyword, using this command adds the specified AS numbers before the original AS_PATH attribute.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If BGP routing information matches AS-path-ACL 1, add AS number 200 before the original AS_PATH attribute.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply as-path 200
```

apply comm-list delete

Syntax **apply comm-list** *comm-list-number* **delete**

undo apply comm-list

View Routing policy view

Parameters *comm-list-number*: Community list number. The basic community list number ranges from 1 to 99. The advanced community list number ranges from 100 to 199.

Description Use the **apply comm-list delete** command to remove community attributes in BGP routing information specified by the community list.

Use the **undo apply comm-list** command to remove the clause configuration.

No community attributes are removed by default.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If BGP routing information matches AS-path-ACL 1, remove community attributes specified in community list 1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply comm-list 1 delete
```

apply community

Syntax **apply community** { **none** | **additive** | { *community-number*&<1-16> | *aa:nn*&<1-16> | **internet** | **no-export-subconfed** | **no-export** | **no-advertise** } ***** [**additive**] }

undo apply community

View Routing policy view

Parameters **none**: Removes community attributes of BGP routes.

community-number: Community sequence number, in the range 1 to 4294967295.

aa:nn: Community number; both aa and nn are in the range 0 to 65535.

&<1-16>: Indicates the argument before it can be entered up to 16 times.

internet: Sets the **internet** community attribute for matched BGP routes. Routes with this attribute are advertised to all BGP peers.

no-export-subconfed: Sets the **no-export-subconfed** community attribute for matched BGP routes. Routes with this attribute are not advertised out the sub autonomous system.

no-advertise: Sets the **no-advertise** community attribute for matched BGP routes. Routes with this attribute are not advertised to any peers.

no-export: Sets the **no-export** community attribute for matched BGP routes. Routes with this attribute are not advertised out the autonomous system or confederation, but can be advertised to other sub ASs in the confederation.

additive: Adds the specified community attributes to the original community attribute of a matched BGP route.

Description Use the **apply community** command to set the specified community attribute for BGP routes.

Use the **undo apply community** command to remove the apply clause.

No community attribute is set by default.

Related commands: **ip community-list**, **if-match community**, **route-policy**.

Examples # Create routing policy **setcommunity** with node 16 and matching mode as permit. Set the no-export community attribute for BGP routes passing AS-path-ACL 8.

```
<Sysname> system-view
[Sysname] route-policy setcommunity permit node 16
[Sysname-route-policy] if-match as-path 8
[Sysname-route-policy] apply community no-export
```

apply cost

Syntax **apply cost** [+ | -] *value*

undo apply cost

View Routing policy view

Parameters **+**: Increases cost value.

+: Decreases cost value.

cost: Specifies a cost from 0 to 4294967295.

Description Use the **apply cost** command to set a cost for routing information.

Use the **undo apply cost** command to remove the clause configuration.

No cost is set for routing information by default.

Related commands: **if-match interface**, **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **route-policy**, **apply ip-address next-hop**, **apply local-preference**, **apply origin** and **apply tag**.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a route matches the outbound interface Serial 2/0, set the cost for the route to 120.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match interface serial 2/0
[Sysname-route-policy] apply cost 120
```

apply cost-type

Syntax **apply cost-type** { **external** | **internal** | **type-1** | **type-2** }

undo apply cost-type

View Routing policy view

Parameters **external**: IS-IS external route.

internal: IS-IS internal route.

type-1: Type-1 external route of OSPF.

type-2: Type-2 external route of OSPF.

Description Use the **apply cost-type** command to set a cost type for routing information.

Use the **undo apply cost-type** command to remove the clause configuration.

No cost type is set for routing information by default.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a route matches tag 8, set the cost type for the route to IS-IS internal route.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match tag 8
[Sysname-route-policy] apply cost-type internal
```

apply extcommunity

Syntax **apply extcommunity** { **rt** *route-target* }&<1-16> [**additive**]

undo apply extcommunity

View Routing policy view

Parameters **rt** *route-target*: Sets the route target extended community attribute, which is a string of 3 to 21 characters. *route-target* has two forms:

16-bit AS number: 32-bit self-defined number, for example, 101:3;

32-bit IP address: 16-bit self-defined number, for example, 192.168.122.15:1.

&<1-16>: Indicates the argument before it can be entered up to 16 times.

additive: Adds to the original community attribute of a route.

Description Use the **apply extcommunity** command to apply the specified extended community attribute to BGP routes.

Use the **undo apply extcommunity** command to remove the clause configuration.

No extended community attribute is set for routing information by default.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a BGP route matches AS-path-ACL 1, add the RT extended community attribute 100:2 to the route.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply extcommunity rt 100:2 additive
```

apply isis

apply isis { **level-1** | **level-1-2** | **level-2** }

undo apply isis

View Routing policy view

Parameters **level-1**: Redistributes routes into IS-IS level-1 area.

level-2: Redistributes routes into IS-IS level-2 area.

level-1-2: Redistributes routes into IS-IS level-1 and level-2 areas.

Description Use the **apply isis** command to redistribute routes into a specified ISIS level.

Use the **undo apply isis** command to remove the clause configuration.

No level is set by default.

Related commands: **if-match interface**, **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **route-policy**, **apply cost**, **apply origin** and **apply tag**.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a route matches tag 8, redistribute the route to IS-IS level-2 area.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match tag 8
[Sysname-route-policy] apply isis level-2
```

apply local-preference

Syntax **apply local-preference** *preference*

undo apply local-preference

View Routing policy view

Parameters *preference*: BGP local preference, in the range 0 to 4294967295.

Description Use the **apply local-preference** command to apply the specified local preference to BGP routes.

Use the **undo apply local-preference** command to remove the clause configuration.

No local preference is set for BGP routing information by default.

Related commands: **route-policy**.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a route matches AS-path-ACL 1, set the local preference for the route to 130.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply local-preference 130
```

apply mpls-label

Syntax **apply mpls-label**

undo apply mpls-label

View Routing policy view

Parameters None

Description Use the **apply mpls-label** command to set MPLS label for routing information.

Use the **undo apply mpls-label** command to remove the clause configuration.

No MPLS label is set by default.

If MPLS label failed to apply, the routing information can not be advertised.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a route matches AS-path-ACL 1, set MPLS label for the route.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply mpls-label
```

apply origin

Syntax **apply origin** { **igp** | **egp** *as-number* | **incomplete** }

undo apply origin

View Routing policy view

Parameters **igp**: Sets the origin of BGP routing information to IGP.

egp: Sets the origin of BGP routing information to EGP.

as-number: Autonomous system number for EGP routes, in the range of 1 to 65535.

incomplete: Sets the origin of BGP routing information to unknown.

Description Use the **apply origin** command to apply the specified origin attribute to BGP routes.

Use the **undo apply origin** command to remove the clause configuration.

No origin attribute is set for routing information by default.

Related commands: **if-match interface**, **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **route-policy**, **apply ip-address next-hop**, **apply local-preference**, **apply cost** and **apply tag**.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a route matches AS-path-ACL 1, set the origin for the route to IGP.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply origin igp
```

apply preference

Syntax **apply preference** *preference*

undo apply preference

View Routing policy view

Parameters *preference*: Routing preference, in the range of 1 to 255.

Description Use the **apply preference** command to set a preference for a routing protocol.

Use the **undo apply preference** command to remove the clause configuration.

No preference is set for a routing protocol by default.

If you set preferences for routing protocols with the **preference** command, using the **apply preference** command will set a new preference for a matched routing protocol. Other routing protocols not satisfying criteria still use the preferences set by the **preference** command.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a route matches OSPF external route type, set the preference for the routing protocol to 90.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match route-type external-type1or2
[Sysname-route-policy] apply preference 90
```

apply preferred-value

Syntax **apply preferred-value** *preferred-value*

undo apply preferred-value

View Routing policy view

Parameters *preferred-value*: Preferred value, in the range of 0 to 65535.

Description Use the **apply preferred-value** command to apply a preferred value to BGP routes.

Use the **undo apply preferred-value** command to remove the clause configuration.

No preferred value is set for BGP routes by default.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a BGP route matches AS-path-ACL 1, set the preferred value 66 for the BGP route.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply preferred-value 66
```

apply tag

Syntax **apply tag** *value*

undo apply tag

View Routing policy view

Parameters *value*: Tag value, in the range 0 to 4294967295.

Description Use the **apply tag** command to set a specified tag value for RIP, OSPF or IS-IS routing information.

Use the **undo apply tag** command to remove the clause configuration.

No routing tag is set for RIP, OSPF or IS-IS routing information by default.

Related commands: **if-match interface**, **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **route-policy**, **apply ip-address next-hop**, **apply local-preference**, **apply cost** and **apply origin**.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. If a route matches OSPF external route type 1, set the tag of the route to 100.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match route-type external-type1
[Sysname-route-policy] apply tag 100
```

display ip as-path

Syntax **display ip as-path** [*as-path-acl number*]

View Any view

Parameters *as-path-acl-number*: AS path ACL number, in the range of 1 to 256.

Description Use the **display ip as-path** command to display BGP AS path ACL information.

Information about all BGP AS path ACLs will be displayed if no *as-path-acl-number* is specified.

Related commands: **ip as-path**, **if-match as-path** and **apply as-path**.

Examples # Display the information of BGP AS path ACL 1.

```
<Sysname> display ip as-path-acl 1
ListID    Mode      Expression
1         permit    2
```

Table 283 Description on the fields of the display ip as-path-acl command

Field	Description
ListID	AS path ACL ID
Mode	Matching mode: permit, deny
Expression	Regular expression for matching

display ip community-list

Syntax **display ip community-list** [*basic-community-list-number* | *adv-community-list-number*]

View Any view

Parameters *basic-community-list-number*: Basic community list number, in the range of 1 to 99.

adv-community-list-number: Advanced community list number, in the range of 100 to 199.

Description Use the **display ip community-list** command to display BGP community list information.

All BGP community list information will be displayed if no *basic-community-list-number* or *adv-community-list-number* is specified.

Related commands: **ip community-list**, **if-match community** and **apply community**.

Examples # Display the information of the BGP community list 1.

```
<Sysname> display ip community-list 1
Community List Number 1
         permit  1:1 1:2 2:2
```

display ip extcommunity-list

Syntax **display ip extcommunity-list** [*ext-comm-list-number*]

View Any view

Parameters *ext-comm-list-number*: Extended community list number, in the range of 1 to 199.

Description Use the **display ip extcommunity-list** command to display BGP extended community list information.

All BGP extended community list information will be displayed if no *ext-comm-list-number* is specified.

Related commands: **ip extcommunity-list**, **if-match extcommunity**, **apply extcommunity**.

Examples # Display the information of BGP extended community list 1.

```
<Sysname> display ip extcommunity-list 1
Extended Community List Number 1
         permit rt : 9:6
```

display route-policy

Syntax **display route-policy** [*route-policy-name*]

View Any view

Parameters *route-policy-name*: Routing policy name, a string of 1 to 19 characters.

Description Use the **display route-policy** command to display routing policy information.

All routing policy information will be displayed if no *route-policy-name* is specified.

Related commands: **route-policy**.

Examples # Display the information of routing policy 1.

```
<Sysname> display route-policy policy1
Route-policy : policy1
  permit : 10
        if-match ip-prefix abc
        apply cost 120
```

Table 284 Description on the fields of the display route-policy command.

Field	Description
Route-policy	Routing policy name
Permit	permit mode: permit, deny
if-match ip-prefix abc	Match criterion
apply cost 120	If the match criterion is satisfied, set the route cost to 120.

if-match as-path

Syntax **if-match as-path** *as-path-number*&<1-16>

undo if-match as-path [*as-path-number*&<1-16>]

View Routing policy view

Parameters *as-path-number*: AS path ACL number, in the range of 1 to 256.

&<1-16>: Indicates the argument before it can be entered up to 16 times.

Description Use the **if-match as-path** command to specify AS path ACL(s) for matching against the AS path attribute of BGP routing information.

Use the **undo if-match as-path** command to remove the match criterion.

The match criterion is not configured by default.

This command is one of the if-match clauses of a route policy, used for filtering BGP routing information and specifying match criteria according to the AS path attribute of routing information.

Related commands: **route-policy**, **ip as-path** *acl*.

Examples # Define as-path-acl 2, allowing routing information containing AS 200 or 300 to pass. Define routing policy **test** with node 10, and set an if-match clause using the as-path-acl for matching.

```
<Sysname> system-view
[Sysname] ip as-path 2 permit _*200.*300
[Sysname] route-policy test permit node 10
[Sysname-route-policy] if-match as-path 2
```

if-match community

Syntax **if-match community** { *basic-community-list-number* [**whole-match**] | *adv-community-list-number* }&<1-16>

undo if-match community [*basic-community-list-number* | *adv-community-list-number*]&<1-16>

View Routing policy view

Parameters *basic-community-list-number*: Basic community list number, in the range of 1 to 99.

adv-community-list-number: Advanced community list number, in the range of 100 to 199.

whole-match: Specifies the exact match. All and only the specified communities must be present.

&<1-16>: Indicates the argument before it can be entered up to 16 times.

Description Use the **if-match community** command to specify community list(s) for matching against the community attribute of BGP routing information.

Use the **undo if-match community** command to remove the match criterion.

The match criterion is not configured by default.

This command is one of the if-match clauses of route policy, used for filtering BGP routing information and specifying match criterion according to the community attribute of BGP routing information.

Related commands: **route-policy** and **ip community-list**.

Examples # Define community-list 1, allowing routing information with community number 100 or 200 to pass. Then define a routing policy named test, whose node 10 is defined with an if-match clause to reference the community-list for matching.

```
<Sysname> system-view
[Sysname] ip community-list 1 permit 100 200
[Sysname] route-policy test permit node 10
[Sysname-route-policy] if-match community 1
```

if-match cost

Syntax **if-match cost** *value*

undo if-match cost

View Routing policy view

Parameters *cost*: Specifies the cost to match, ranging from 0 to 4294967295.

Description Use the **if-match cost** command to specify a cost for matching against the cost of a route.

Use the **undo if-match cost** command to remove the match criterion.

The match criterion is not configured by default.

This command is one of the if-match clauses of routing policy, used for matching routes with the specified route cost.

Related commands: **if-match interface**, **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match tag**, **route-policy**, **apply ip-address next-hop**, **apply cost**, **apply local-preference**, **apply origin** and **apply tag**.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. Define an if-match clause to permit routing information with a cost of 8.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match cost 8
```

if-match extcommunity

Syntax **if-match extcommunity** *ext-comm-list-number*&<1-16>

undo if-match extcommunity [*ext-comm-list-number*&<1-16>]

View Routing policy view

Parameters *ext-comm-list-number*: Extended community list number, in the range of 1 to 199.

&<1-16>: Indicates the argument before it can be entered up to 16 times.

Description Use the **if-match extcommunity** command to specify extended community list(s) for matching against the extended community attribute of routing information.

Use the **undo if-match extcommunity** command to remove the match criterion.

The match criterion is not configured by default.

Examples # Create a routing policy named policy1 with node 10, matching mode as permit. Match the extended community attribute of routes against extended community lists 100 and 150.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match extcommunity 100 150
```

if-match interface

Syntax **if-match interface** { *interface-type interface-number* }&<1-16>

undo if-match interface [*interface-type interface-number*]&<1-16>

View Routing policy view

Parameters *interface-type*: Interface type

interface-number: Interface number

&<1-16>: Indicates the argument before it can be entered up to 16 times.

Description Use the **if-match interface** command to specify interface(s) for matching against the outbound interfaces of routing information.

Use the **undo if-match interface** command to remove the match criterion.

The match criterion is not configured by default.

Related commands: **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **route-policy**, **apply ip-address next-hop**, **apply cost**, **apply local-preference**, **apply origin**, **apply tag**.

Examples # Create a routing policy named policy1 with node 10, matching mode as permit. Define an if-match clause to permit the routing information with the outbound interface as Ethernet1/0.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match interface ethernet 1/0
```

if-match mpls-label

Syntax **if-match mpls-label**

undo if-match mpls-label

View Routing policy view

Parameters None

Description Use the **if-match mpls-label** command to specify the MPLS label match criterion.

Use the **undo if-match mpls-label** command to remove the match criterion.

The match criterion is not configured by default.

Examples # Create a routing policy named policy1 with node 10, matching mode as permit. Match MPLS label of routing updates.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match mpls-label
```

if-match route-type

Syntax **if-match route-type** { **internal** | **external-type1** | **external-type2** | **external-type1or2** | **is-is-level-1** | **is-is-level-2** | **nssa-external-type1** | **nssa-external-type2** | **nssa-external-type1or2** } *

undo if-match route-type [**internal** | **external-type1** | **external-type2** | **external-type1or2** | **is-is-level-1** | **is-is-level-2** | **nssa-external-type1** | **nssa-external-type2** | **nssa-external-type1or2**] *

View Routing policy view

Parameters **internal**: Internal routes (OSPF intra-area and inter-area routes).

external-type1: OSPF Type 1 external routes.

external-type2: OSPF Type 2 external routes.

external-type1or2: OSPF Type 1 or 2 external routes.

is-is-level-1: IS-IS Level-1 routes.

is-is-level-2: IS-IS Level-2 routes.

nssa-external-type1: OSPF NSSA Type 1 external routes.

nssa-external-type2: OSPF NSSA Type 2 external routes.

nssa-external-type1or2: OSPF NSSA Type 1 or 2 external routes.

Description Use the **if-match route-type** command to configure a route type match criterion.

Use the **undo if-match route-type** command to remove the match criterion.

The match criterion is not configured by default.

Examples # Create a routing policy named policy1 with node 10, matching mode as permit. Define an if-match clause to match internal routes.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match route-type internal
```

if-match tag

Syntax **if-match tag** *value*

undo if-match tag

View Routing policy view

Parameters *value*: Specifies a tag value, ranging from 0 to 4294967295.

Description Use the **if-match tag** command to specify a tag for matching against the tag field of the routes.

Use the **undo if-match tag** command to remove the match criterion.

The match criterion is not configured by default.

Related commands: **if-match interface**, **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match cost**, **route-policy**, **apply ip-address next-hop**, **apply cost**, **apply local-preference**, **apply origin** and **apply tag**.

Examples # Create a routing policy named policy1 with node 10, matching mode as permit. Define an if-match clause to permit RIP, OSPF and IS-IS routing information with the tag as 8.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match tag 8
```

ip as-path

Syntax **ip as-path** *as-path-number* { **deny** | **permit** } *regular-expression*

undo ip as-path *as-path-number*

View System view

Parameters *as-path-number*: AS path ACL number, in the range of 1 to 256.

deny: Specifies the matching mode for the AS path ACL as deny.

permit: Specifies the matching mode for the AS path ACL as permit.

regular-expression: Regular expression of AS path, a string of 1 to 50 characters.

BGP routing information contains the AS path attribute field that identifies the autonomous systems through which routing information has passed. Used to compare with the AS path attribute, a regular expression is a formula comprised of characters, for example, ^200. *100$, which matches AS path attribute fields that start with AS200 and end with AS100.

The meanings of special characters used in regular expressions are shown below:

Character	Meaning
.	Matches any single character, including blank space.
*	Matches 0 or more patterns.
+	Matches 1 or more patterns.
^	Matches the beginning of an input string.
$	Matches the end of an input string.
_	Matches a comma, left brace, right brace, left parenthesis, right parenthesis, the beginning of an input string, the end of an input string, or a space.
[range]	Means the range of single-character patterns.
-	Separates the ending points of a range.

Description Use the **ip as-path** command to create an AS path ACL.

Use the **undo ip as-path** command to remove an AS path ACL.

No AS path ACL is created by default.

Examples # Create an AS path ACL numbered 1, permitting routing information whose AS_PATH starts with 10.

```
<Sysname> system-view
[Sysname] ip as-path 1 permit ^10
```

ip community-list

Syntax **ip community-list** *basic-comm-list-num* { **deny** | **permit** } [*community-number-list*] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *

undo ip community-list *basic-comm-list-num* [*community-number-list*] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *

ip community-list *adv-comm-list-num* { **deny** | **permit** } *regular-expression*

undo ip community-list *adv-comm-list-num* [*regular-expression*]

View System view

Parameters *basic-comm-list-num*: Basic community list number, in the range 1 to 99.

adv-comm-list-num: Advanced community list number, in the range 100 to 199.

regular-expression: Regular expression of advanced community attribute, a string of 1 to 50 characters.

deny: Specifies the matching mode of the community list as deny.

permit: Specifies the matching mode of the community list as permit.

community-number-list: Community number list, in the *community number* or *aa:nn* format, with *community number* in the range 1 to 4294967295 and *aa* and *nn* in the range 0 to 65535. Each format can be entered up to 16 times.

internet: Routes with this attribute can be advertised to all the BGP peers. By default, all routes have this attribute.

no-advertise: Routes with this attribute will not be advertised to other BGP peers.

no-export: Routes with this attribute will not be advertised out the local AS, or the confederation but can be advertised to other ASs in the confederation.

no-export-subconfed: Routes with this attribute cannot be advertised out the local AS, or to other sub ASs in the confederation.

Description Use the **ip community-list** to define a community list entry.

Use the **undo ip community-list** command to remove a community list or entry.

No community list is defined by default.

Examples # Define basic community list 1 to permit routing information with the **internet** community attribute.

```
<Sysname> system-view
[Sysname] ip community-list 1 permit internet
```

Define advanced community list 100 to permit routing information with the community attribute starting with 10.

```
<Sysname> system-view
[Sysname] ip community-list 100 permit ^10
```

ip extcommunity-list

Syntax **ip extcommunity-list** *ext-comm-list-number* { **deny** | **permit** } { **rt** *route-target* }&<1-16>

undo ip extcommunity-list *ext-comm-list-number*

View System view

Parameters *ext-comm-list-number*: Extended community list number, in the range 1 to 199.

permit: Specifies the matching mode for the extended community list as permit.

deny: Specifies the matching mode for the extended community list as deny.

rt *route-target*: Specifies route target extended community attribute, which is a string of 3 to 21 characters. *route-target* has two forms:

A 16-bit AS number: a 32-bit self-defined number, for example, 101:3;

A 32-bit IP address: a 16-bit self-defined number, for example, 192.168.122.15:1.

&<1-16>: Indicates the argument before it can be entered up to 16 times.

Description Use the **ip extcommunity-list** to define an extended community list entry.

Use the **undo ip extcommunity-list** command to remove an extended community list.

No extended community list is defined by default.

Examples # Define extended community list 1 to permit routing information with RT 200:200.

```
<Sysname> system-view
[Sysname] ip extcommunity-list 1 permit rt 200:200
```

route-policy

Syntax **route-policy** *route-policy-name* { **permit** | **deny** } **node** *node-number*

undo route-policy *route-policy-name* [**node** *node-number*]

View System view

Parameters *route-policy-name*: Routing policy name, a string of 1 to 19 characters.

permit: Specifies the matching mode of the routing policy node as permit. If a route satisfies all the if-match clauses of the node, it passes through the filtering of the node and then is executed with the apply clauses of the node. If not, it goes to the next node of the routing policy.

deny: Specifies the matching mode of the routing policy node as deny. If a route satisfies all the if-match clauses of the node, it does not pass the filtering of the node and will not go to the next node.

node *node-number*: Node number, in the range 0 to 65535. The node with a smaller *node-number* will be tested first when the routing policy is used for filtering routing information.

Description Use the **route-policy** command to create a routing policy and enter its view.

Use the **undo route-policy** command to remove a routing policy.

No routing policy is created by default.

A routing policy is used for routing information filtering or policy routing. It contains several nodes and each node comprises some if-match and apply clauses. The if-match clauses define the matching criteria of the node and the apply clauses define the actions performed after a packet passes the filtering of the node. The relation among the if-match clauses of a node is logic AND, namely all the if-match clauses must be satisfied. The filter relation among different route-policy nodes is logic OR, namely a packet passing a one node passes the routing policy.

Related commands: **if-match interface**, **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **apply ip-address next-hop**, **apply local-preference**, **apply cost**, **apply origin** and **apply tag**.

Examples # Create routing policy 1 with node 10 and matching mode as permit, and then enter routing policy view.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy]
```

79 IPv4 Routing Policy Configuration Commands

apply ip-address next-hop

Syntax **apply ip-address next-hop** *ip-address*

undo apply ip-address next-hop

View Routing policy view

Parameters *ip-address*: IP address of the next hop.

Description Use the **apply ip-address next-hop** command to set a next hop for IPv4 routing information.

Use the **undo apply ip-address next-hop** command to remove the clause configuration.

No next hop address is set for IPv4 routing information by default.

It is invalid to use the **apply ip-address next-hop** command to set a next hop when redistributing routes.

Related commands: **if-match interface**, **if-match acl**, **if-match ip-prefix**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **route-policy**, **apply local-preference**, **apply cost**, **apply origin** and **apply tag**.

Examples # Create routing policy **policy1** with node 10, matching mode **permit**. If passing AS path ACL 1, a route's next hop is set to 193.1.1.8.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply ip-address next-hop 193.1.1.8
```

display ip ip-prefix

Syntax **display ip ip-prefix** [*ip-prefix-name*]

View Any view

Parameters *ip-prefix-name*: IP prefix list name, a string of 1 to 19 characters.

Description Use the **display ip ip-prefix** command to display the statistics of an IPv4 address prefix list. If no ip-prefix-name is specified, statistics for all IPv4 address prefix lists will be displayed.

Related commands: **ip ip-prefix**.

Examples # Display the statistics of IPv4 prefix list **abc**.

```
<Sysname> display ip ip-prefix abc
Prefix-list abc
Permitted 0
Denied 0
        index: 10               permit  1.0.0.0/11              ge  22  le  32
```

Table 285 Description on the fields of the display ip ip-prefix command.

Field	Description
Prefix-list	Name of the IPv4 prefix list
Permitted	Number of routes satisfying the match criterion
Denied	Number of routes not satisfying the match criterion
index	Internal serial number of the IPv4 prefix list
permit	Matching mode: permit or deny
1.0.0.0/11	Match IP address and mask
ge	greater-equal, the lower limit mask
le	less-equal, the upper limit mask

if-match acl

Syntax **if-match acl** *acl-number*

undo if-match acl

View Routing policy view

Parameters *acl-number*: ACL number from 2000 to 3999.

Description Use the **if-match acl** command to configure an ACL match criterion.

Use the **undo if-match** command to remove the match criterion.

No ACL match criterion is configured by default.

Related commands: **if-match interface**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **route-policy**, **apply ip-address next-hop**, **apply cost**, **apply local-preference**, **apply origin**,**apply tag**.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. Define an if-match clause to permit routes matching ACL 2000.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match acl 2000
```

if-match ip

Syntax **if-match ip** { **next-hop** | **route-source** } { **acl** *acl-number* | **ip-prefix** *ip-prefix-name* }

undo if-match ip { **next-hop** | **route-source** } [**acl** | **ip-prefix**]

View Routing policy view

Parameters **next-hop**: Matches next hop.

route-source: Matches source address.

acl *acl-number*: Matches an ACL with a number from 2000 to 2999.

ip-prefix *ip-prefix-name*: Matches an IP prefix list with a name being a string of 1 to 19 characters.

Description Use the **if-match ip** command to configure a next hop or source address match criterion for IPv4 routes.

Use the **undo if-match ip** command to remove the match criterion.

The match criterion is not configured by default.

Related commands: **route-policy**.

Examples # Create routing policy **policy1** with node 10, matching mode as permit. Define an if-match clause to permit routing information whose next hop address matches IP prefix list p1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match ip next-hop ip-prefix p1
```

if-match ip-prefix

Syntax **if-match ip-prefix** *ip-prefix-name*

undo if-match ip-prefix

View Routing policy view

Parameters *ip-prefix-name*: Matches an IP prefix list with a name being a string of 1 to 19 characters.

Description Use the **if-match ip-prefix** command to configure an IP prefix list based match criterion.

Use the **undo if-match ip-prefix** command to remove the match criterion.

No IP prefix list based match criterion is configured by default.

Related commands: **if-match interface**, **if-match ip next-hop**, **if-match cost**, **if-match tag**, **route-policy**, **apply ip-address next-hop**, **apply cost**, **apply local-preference**, **apply origin**, **apply tag**.

Examples # Create routing policy **policy2** with node 10, matching mode as **permit**. Define an if-match clause to permit routes whose destination addresses match IP prefix list **p1**.

```
<Sysname> system-view
[Sysname] route-policy policy2 permit node 10
[Sysname-route-policy] if-match ip-prefix p1
```

ip ip-prefix

Syntax **ip ip-prefix** *ip-prefix-name* [**index** *index-number*] { **permit** | **deny** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

undo ip ip-prefix *ip-prefix-name* [**index** *index-number*]

View System view

Parameters *ip-prefix-name*: IPv4 prefix list name, a string of 1 to 19 characters.

index-number: Index number, in the range 1 to 65535, for uniquely specifying an item of the IPv4 prefix list. The index with a smaller number is tested first.

permit: Specifies the matching mode for the IPv4 prefix list as permit, that is, when a route to be filtered is in the range of the IPv4 prefix list, the route passes the IPv4 prefix list without needing to enter the next item for testing. If the route to be filtered is not in the prefix range, it will enter the next item test.

deny: Specifies the matching mode for the IPv4 prefix list as deny, that is, when a route to be filtered is in the IPv4 prefix list range, the route neither passes the filter nor enters the next node for testing. If not in the range, the route will enter the next item test.

ip-address mask-length: Specifies an IPv4 address prefix and mask length. The *mask-length* is in the range 0 to 32.

min-mask-length, *max-mask-length*: Specifies the range for prefix if the IPv4 address and prefix length are matched. **greater-equal** means "greater than or equal to" and **less-equal** means "less than or equal to". The range relation is *mask-length* <= *min-mask-length* <= *max-mask-length* <= 32. If only *min-mask-length* is specified, the prefix length range is [min-mask-length, 32]. If only *max-mask-length* is specified, the prefix length range is [mask-length, max-mask-length]. If both min-mask-length and max-mask-length are specified, the prefix length range is [min-mask-length, max-mask-length].

Description Use the **ip ip-prefix** command to configure an IPv4 prefix list item.

Use the **undo ip ip-prefix** command to remove an IPv4 prefix list or an item.

No IPv4 prefix list is configured by default.

An IPv4 prefix list is used to filter IPv4 addresses. It may have multiple items, each of which specifies a range of IPv4 prefix. The filtering relation among items is logic OR, namely, passing any item means the IPv4 prefix list is passed. If no item is passed, the IP prefix list cannot be passed.

The IP prefix range is determined by *mask-length* and [*min-mask-length, max-mask-length*]. If both *mask-length* and [*min-mask-length, max-mask-length*] are specified, then the IP address to be filtered must satisfy both of them.

If *ip-address mask-length* is specified as 0.0.0.0 0, then only the default routes will be matched.

To match all the routes, use 0.0.0.0 0 **less-equal** 32.

Examples # Create a routing policy named policy1 with node 10, matching mode as permit. Define an IP prefix list named p1 to permit only the routes in the network segment 10.0.192.0/8 and with mask length 17 or 18.

```
<Sysname> system-view
[Sysname] ip ip-prefix p1 permit 10.0.192.0 8 greater-equal 17 less-equal 18
```

reset ip ip-prefix

Syntax **reset ip ip-prefix** [*ip-prefix-name*]

View User view

Parameters *ip-prefix-name*: IP prefix list name, a string of 1 to 19 characters.

Description Use the **reset ip ip-prefix** command to clear the statistics of a specified IPv4 prefix list. If no *ip-prefix-name* is specified, the statistics of all the IPv4 prefix lists will be cleared.

Examples # Clear the statistics of IPv4 prefix list **abc**.

```
<Sysname> reset ip ip-prefix abc
```

80 IPv6 Routing Policy Configuration Commands

apply ipv6 next-hop

Syntax **apply ipv6 next-hop** *ipv6-address*

undo apply ipv6 next-hop

View Routing policy view

Parameters *ipv6-address*: Next hop IPv6 address.

Description Use the **apply ipv6 next-hop** command to apply a next hop to IPv6 routes.

Use the **undo apply ipv6 next-hop** command to remove the clause configuration.

No next hop address is set for IPv6 routing information by default.

Using the **apply ipv6 next-hop** command to set a next hop when redistributing routes does not take effect.

Examples # Create routing policy **policy1** with node 10, matching mode **permit**. If a route matches AS path ACL 1, set next hop 3ff3:506::1 for it.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match as-path 1
[Sysname-route-policy] apply ipv6 next-hop 3ffe:506::1
```

display ip ipv6-prefix

Syntax **display ip ipv6-prefix** [*ipv6-prefix-name*]

View Any view

Parameters *ipv6-prefix-name*: IPv6 prefix list name, a string of 1 to 19 characters.

Description Use the **display ip ipv6-prefix** command to display the statistics of the specified IPv6 prefix list. If no IPv6 prefix list is specified, the statistics of all the IPv6 prefix lists will be displayed.

Examples # Display the statistics of all the IPv6 prefix lists.

```
<Sysname> display ip ipv6-prefix
Prefix-list6 abc
Permitted 0
Denied 0
         index:   10            permit  ::/0
         index:   20             permit  ::/1                ge  1   le  128
```

Table 286 Description on the fields of the display ip ipv6-prefix command

Field	Description
Prefix-list6	Name of the IPv6 prefix list
Permitted	Number of routes satisfying the match criterion
Denied	Number of routes not satisfying the match criterion
Index	Internal serial number of address prefix list
Permit	Matching mode: permit, deny
::/1	IPv6 address and its prefix length for matching
ge	greater-equal, the lower limit prefix length
Le	less-equal, the upper limit prefix length

if-match ipv6

Syntax **if-match ipv6** { **address** | **next-hop** | **route-source** } { **acl** *acl6-number* | **prefix-list** *ipv6-prefix-name* }

undo if-match ipv6 { **address** | **next-hop** | **route-source** } [**acl** | **prefix-list**]

View Routing policy view

Parameters **address**: Matches the destination address of IPv6 routing information.

next-hop: Matches the next hop of IPv6 routing information.

route-source: Matches the source address of IPv6 routing information.

acl *acl6-number*: Specifies the number of an IPv6 ACL for filtering, in the range 2000 to 3999 for **address**, and 2000 to 2999 for **next-hop** and **route-source**.

prefix-list *ipv6-prefix-name*: Specifies the name of a IPv6 prefix list for filtering, a string of 1 to 19 characters.

Description Use the **if-match ipv6** command to configure a destination, next hop or source address based match criterion for IPv6 routes.

Use the **undo if-match ipv6** command to remove the match criterion.

The match criterion is not configured by default.

Examples # Create a routing policy named policy1 with node 10, matching mode as permit. Define an if-match clause to permit the routing information whose next hop address matches IPv6 prefix list p1.

```
<Sysname> system-view
[Sysname] route-policy policy1 permit node 10
[Sysname-route-policy] if-match ipv6 next-hop prefix-list p1
```

ip ipv6-prefix

Syntax

ip ipv6-prefix *ipv6-prefix-name* [**index** *index-number*] { **deny** | **permit** } *ipv6-address prefix-length* [**greater-equal** *min-prefix-length*] [**less-equal** *max-prefix-length*]

undo ip ipv6-prefix *ipv6-prefix-name* [**index** *index-number*]

View System view

Parameters *ipv6-prefix-name*: IPv6 prefix list name, a string of 1 to 19 characters, for uniquely specifying an IPv6 prefix list.

index-number: Index number, in the range 1 to 65535, for uniquely specifying an IPv6 prefix list item. The item with a smaller *index-number* will be tested first.

permit: Specifies the matching mode for the IPv6 prefix list as permit, that is, if a route matches the IPv6 prefix list, it passes the IPv6 prefix list without needing to enter the next item for test. If not, it will enter the next item test.

deny: Specifies the matching mode for the IPv6 prefix list as deny, that is, if a route matches the IPv6 prefix list, the route neither passes the filter nor enters the next node for test. If not, the route will enter the next item test.

ipv6-address prefix-length: Specifies an IPv6 prefix and prefix length, with *prefix-length* being in the range 0 to 128. When specified as :: 0, it matches the default route.

greater-equal *min-prefix-length:* Greater than or equal to the minimum prefix length.

less-equal *max-prefix-length*: Less than or equal to the maximum prefix length.

The length relation is *mask-length* <= *min-mask-length* <= *max-mask-length* <= 32. If only min-prefix-length is specified, the prefix length range is [min-prefix-length, 128]. If only max-prefix-length is specified, the prefix length range is [prefix-length, max-prefix-length]. If both min-prefix-length and max-prefix-length are specified, the prefix length range is [min-prefix-length, max-prefix-length].

Description Use the **ip ipv6-prefix** command to configure an IPv6 prefix list item.

Use the **undo ip ipv6-prefix** command to remove an IPv6 prefix list or an item.

No IPv6 prefix list is configured by default.

The IPv6 address prefix list is used to filter IPv6 addresses. It may have multiple items, and each of them specifies a range of IPv6 prefix. The filtering relation among items is logic OR, namely, a route passing an item will pass the prefix list.

The IPv6 prefix range is determined by *prefix-length* and [*min-prefix-length, max-prefix-length*]. If both *mask-length* and [*min-mask-length, max-mask-length*] are specified, then the IPv6 addresses must satisfy both of them.

If *ipv6-address prefix-length* is specified as :: 0, then only the default route matches.

If you want to it match all the routes, configure it as :: 0 **less-equal** 128.

Examples # Permit the IPv6 addresses with mask length between 32 bits and 64 bits.

```
<Sysname> system-view
[Sysname] ip ipv6-prefix abc permit :: 0 greater-equal 32 less-equal 64
```

Deny the IPv6 addresses with prefix as 3FFE:D00::/32, prefix length greater than or equal to 32 bits.

```
<Sysname> system-view
[Sysname] ip ipv6-prefix abc deny 3FEE:D00:: 32 less-equal 128
```

reset ip ipv6-prefix

Syntax **reset ip ipv6-prefix** [*ipv6-prefix-name*]

View User view

Parameters *ipv6-prefix-name*: IPv6 prefix list name, a string of 1 to 19 characters.

Description Use the **reset ip ipv6-prefix** command to clear the statistics of the specified IPv6 prefix list. If no name is specified, the statistics of all IPv6 prefix lists will be cleared.

Examples # Clear the statistics of IPv6 prefix list **abc**.

```
<Sysname> reset ip ipv6-prefix abc
```

81 STATIC ROUTING CONFIGURATION COMMANDS

delete static-routes all

Syntax **delete** [**vpn-instance** *vpn-instance-name*] **static-routes all**

View System view

Parameters *vpn-instance-name*: Name of a VPN instance, a string of 1 to 31 case-sensitive characters.

Description Use the **delete static-routes all** command to delete all static routes.

When you use this command to delete static routes, the system will prompt you to confirm the operation before deleting all the static routes.

Related commands: **display ip routing-table** on page 929 and **ip route-static**.

Examples # Delete all static routes on the router.

```
<Sysname> system-view
[Sysname] delete static-routes all
This will erase all ipv4 static routes and their configurations, you must reconf
igure all static routes
Are you sure?[Y/N]:Y
```

ip route-static

Syntax **ip route-static** *dest-address* { *mask* | *mask-length* } { *gateway-address* [**track** *track-entry-number*] | *interface-type interface-number* | **vpn-instance** *d-vpn-instance-name gateway-address* [**track** *track-entry-number*] } [**preference** *preference-value*] [**tag** *tag-value*] [**description** *description-text*]

undo ip route-static *dest-address* { *mask* | *mask-length* } [*gateway-address* | *interface-type interface-number* [*gateway-address*] | **vpn-instance** *d-vpn-instance-name gateway-address*] [**preference** *preference-value*]

ip route-static vpn-instance *s-vpn-instance-name*&<1-6> *dest-address* { *mask* | *mask-length* } { *gateway-address* [**track** *track-entry-number*] [**public**] | *interface-type interface-number* | **vpn-instance** *d-vpn-instance-name gateway-address* [**track** *track-entry-number*] } [**preference** *preference-value*] [**tag** *tag-value*] [**description** *description-text*]

undo ip route-static vpn-instance *s-vpn-instance-name*&<1-6> *dest-address* { *mask* | *mask-length* } [*gateway-address* [**public**] | *interface-type interface-number* [*gateway-address*] | **vpn-instance** *d-vpn-instance-name gateway-address*] [**preference** *preference-value*]

View System view

Parameters **vpn-instance** *s-vpn-instance-name*&<1-6>: Specifies the VPN instance name, which is a string of 1 to 31 case-sensitive characters. &<1-6> indicates the argument before it can be entered up to 6 times. Each VPN instance has its own routing table, and the configured static route is installed in the routing tables of the specified VPN instances.

dest-address: Destination IP address of the static route, in dotted decimal notation.

mask: Mast of the IP address, in dotted decimal notation.

mask-length: Mask length, in the range 0 to 32.

gateway-address: IP address of the next hop, in dotted decimal notation.

interface-type interface-number: Specifies the output interface by its type and number. If the output interface is a broadcast interface, such as an Ethernet interface, a virtual template or a VLAN interface, the next hop address must be specified.

vpn-instance *d-vpn-instance-name*: Name of the destination VPN instance, case-sensitive. If a destination VPN instance name is specified, the router will search the output interface in the destination VPN instance based on the configured *gateway-address*.

gateway-address **public**: Indicates that the specified *gateway-address* is a public network address, rather than a VPN instance address.

preference *preference-value* : Specifies the preference of the static route, which is in the range of 1 to 255 and defaults to 60.

tag *tag-value*: Sets a tag value for the static route. Tags of routes are used in routing policies to control routing. For information about routing policy, refer to "Routing Policy Common Configuration Commands" on page 1187.

description *description-text*: Configures a description for the static route, which consists of 1 to 60 characters, including special characters like space, but excluding "?".

track *track-entry-number*: Associates the static route with a track entry. Use the *track-entry-number* argument to specify a track entry number, in the range 1 to 1024. Support for this argument varies with devices.

Description Use the **ip route-static** command to configure a unicast static route.

Use the **undo ip route-static** command to delete a unicast static route.

When configuring a unicast static route, note that:

1. If the destination IP address and the mask are both 0.0.0.0, the configured route is a default route. If routing table searching fails, the router will use the default route for packet forwarding.
2. Different route management policies can be implemented for different route preference configurations. For example, specifying the same preference for different routes to the same destination address enables load sharing, while specifying different preferences for these routes enables route backup.
3. When configuring a static route, you can specify the output interface or the next hop address based on the actual requirement. Note that the next hop address must not be the IP address of the local interface; otherwise, the route configuration will not take effect. For interfaces that support network address to link layer address resolution or point-to-point interfaces, you can specify the output interface or next hop address. When specifying the output interface, note that:
   - For a NULL0 or loopback interface, if the output interface has already been configured, there is no need to configure the next hop address.
   - For point-to-point interfaces, you can specify the output interface if you do not know the peer address. Thus, there is no need to change the router's configuration even if the peer address is changed. A PPP interface obtains the peer's IP address through PPP negotiation. In this case, you need only specify the output interface.
   - For NBMA and P2MP interfaces, which support point-to-multipoint networks, the IP address to link layer address mapping must be established in addition to IP route configuration. In general, it is recommended to configure the next hop IP address when you configure the output interface.
   - It is not recommended to specify a broadcast interface (such as an Ethernet interface, virtual template, or VLAN interface) as the output interface for a static route, because a broadcast interface may have multiple next hops. If you have to do so, you must specify the corresponding next hop of the interface at the same time.

Related commands: **display ip routing-table** on page 929 and **ip route-static default-preference**.

- *The static route does not take effect if you specify its next hop address first and then configure the address as the IP address of a local interface, such as Ethernet interface and VLAN interface.*
- *To configure track monitoring for an existing static route, simply associate the static route with a track entry. For a non-existent static route, configure it and associate it with a Track entry.*
- *If the track module uses NQA to detect the reachability of the private network static route's nexthop, the VPN instance number of the static route's nexthop must be identical to that configured in the NQA test group.*
- *If a static route needs route recursion, the associated track entry must monitor the nexthop of the recursive route instead of that of the static route; otherwise, a valid route may be mistakenly considered invalid.*

Examples # Configure a static route, whose destination address is 1.1.1.1/24, next hop address is 2.2.2.2, tag value is 45, and description information is "**for internet & intranet**".

```
<Sysname> system-view
[Sysname] ip route-static 1.1.1.1 24 2.2.2.2 tag 45 description for
internet & intranet
```

Configure a static route for a VPN instance named **vpn1**: the destination address is 1.1.1.1/16 and the next hop address is 1.1.1.2, which is the address of this VPN instance.

```
<Sysname> system-view
[Sysname] ip route-static vpn-instance vpn1 1.1.1.1 16 vpn-instance
vpn1 1.1.1.2
```

ip route-static default-preference

Syntax **ip route-static default-preference** *default-preference-value*

undo ip route-static default-preference

View System view

Parameters *default-preference-value*: Default preference for static routes, which is in the range of 1 to 255.

Description Use the **ip route-static default-preference** command to configure the default preference for static routes.

Use the **undo ip route-static default-preference** command to restore the default.

By default, the default preference of static routes is 60.

Note that:

- If no preference is specified when configuring a static route, the default preference is used.
- When the default preference is re-configured, it applies to newly added static routes only.

Related commands: **display ip routing-table** on page 929 and **ip route-static**.

Examples # Set the default preference of static routes to 120.

```
<Sysname> system-view
[Sysname] ip route-static default-preference 120
```

82 IPv6 BGP CONFIGURATION COMMANDS

balance (IPv6 address family view)

Syntax **balance** *number*

undo balance

View IPv6 address family view

Parameters *number*: Number of BGP routes participating in load balancing, in the range 1 to 8. When it is set to 1, no load balancing is available.

Description Use the **balance** command to configure the number of routes participating in IPv6 BGP load balancing.

Use the **undo balance** command to restore the default.

The feature is not available by default.

Unlike IGP, BGP has no explicit metric for making load balancing decision. Instead, it implements load balancing by defining its routing rule.

Related commands: **display ipv6 routing-table** on page 942.

Examples # Set the number of routes participating in IPv6 BGP load balancing to 2.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] balance 2
```

bestroute as-path-neglect (IPv6 address family view)

Syntax **bestroute as-path-neglect**

undo bestroute as-path-neglect

View IPv6 address family view

Parameters None

Description Use the **bestroute as-path-neglect** command to configure the IPv6 BGP router to not evaluate the AS_PATH during best route selection.

Use the **undo bestroute as-path-neglect** command to configure the IPv6 BGP router to use the AS_PATH during best route selection.

By default, the router takes AS_PATH as a factor when selecting the best route.

Examples # Ignore AS_PATH in route selection.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] bestroute as-path-neglect
```

bestroute compare-med (IPv6 address family view)

Syntax **bestroute compare-med**

undo bestroute compare-med

View IPv6 address family view

Parameters None

Description Use the **bestroute compare-med** command to enable the comparison of the MED for paths from each AS.

Use the **undo bestroute compare-med** command to disable this comparison.

This comparison is not enabled by default.

Examples # Compare the MED for paths from an AS for selecting the best route.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] bestroute compare-med
```

bestroute med-confederation (IPv6 address family view)

Syntax **bestroute med-confederation**

undo bestroute med-confederation

View IPv6 address family view

Parameters None

Description Use the **bestroute med-confederation** command to enable the comparison of the MED for paths from confederation peers for best route selection.

Use the **undo bestroute med-confederation** command to disable the comparison.

By default, this comparison is not enabled.

With this feature enabled, the system can only compare the MED for paths from peers within the confederation. Paths from external ASs are advertised throughout the confederation without MED comparison.

Examples # Compare the MED for paths from peers within the confederation.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] bestroute med-confederation
```

compare-different-as-med (IPv6 address family view)

Syntax **compare-different-as-med**

undo compare-different-as-med

View IPv6 address family view

Parameters None

Description Use the **compare-different-as-med** command to enable the comparison of the MED for paths from peers in different ASs.

Use the **undo compare-different-as-med** command to disable the comparison.

The comparison is disabled by default.

If there are several paths available for one destination, the path with the smallest MED value is selected.

Do not use this command unless associated ASs adopt the same IGP protocol and routing selection method.

Examples # Enable to compare the MED for paths from peers in different ASs.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] compare-different-as-med
```

dampening (IPv6 address family view)

Syntax **dampening** [*half-life-reachable half-life-unreachable reuse suppress ceiling* | **route-policy** *route-policy-name*] *

undo dampening

View IPv6 address family view

Parameters *half-life-reachable*: Specifies the half-life for active routes, in the range 1 to 45 minutes. By default, the value is 15 minutes.

half-life-unreachable: Specifies the half-life for active routes, in the range 1 to 45 minutes. By default, the value is 15 minutes.

reuse: Specifies the reuse threshold value for suppressed routes, in the range 1 to 20000. Penalty value of a suppressed route decreasing under the value is reused. By default, its value is 750.

suppress: Specifies a suppression threshold from 1 to 20000, which should be bigger than the *reuse* value. Routes with a penalty value bigger than the threshold are suppressed. By default, it is 2000.

ceiling: Specifies a ceiling penalty value from 1001 to 20000. The value must be bigger than the *suppress* value. By default, the value is 16000.

route-policy-name: Routing policy name, a string of 1 to 19 characters.

half-life-reachable, half-life-unreachable, reuse, suppress and *ceiling* are mutually dependent. Once any one is configured, all the others should also be specified accordingly.

Description Use the **dampening** command to enable IPv6 BGP route dampening or/and configure dampening parameters.

Use the **undo dampening** command to disable route dampening.

By default, no route dampening is configured.

Related commands: **reset bgp ipv6 dampening**, **reset bgp ipv6 flap-info**, **display bgp ipv6 routing-table dampened**, **display bgp ipv6 routing-table dampening parameter** and **display bgp ipv6 routing-table flap-info**.

Examples # Enable IPv6 BGP route dampening and configure route dampening parameters.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] dampening 10 10 1000 2000 3000
```

default local-preference(IPv6 address family view)

Syntax **default local-preference** *value*

undo default local-preference

View IPv6 address family view

Parameters *value*: Default local preference, in the range 0 to 4294967295. The larger the value is, the higher the preference is.

Description Use the **default local-preference** command to configure the default local preference.

Use the **undo default local-preference** command to restore the default value.

By default, the default local preference is 100.

Use this command to affect IPv6 BGP route selection.

Examples # Two devices A and B in the same AS are connected to another AS. Change the local preference of B from default value 100 to 180, making the route passing B preferred.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] default local-preference 180
```

default med (IPv6 address family view)

Syntax **default med** *med-value*

undo default med

View IPv6 address family view

Parameters *med-value*: MED value, in the range 0 to 4294967295.

Description Use the **default med** command to specify the default MED value.

Use the **undo default med** command to restore the default.

By default, the default *med-value* is 0.

The multi-exit discriminator (MED) is an external metric of a route. Different from local preference, MED is exchanged between ASs and will stay in the AS once it enters the AS. The route with a lower MED is preferred. When a router running BGP obtains several routes with the identical destination and different next-hops from various external peers, it will select the best route depending on the MED

value. In the case that all other conditions are the same, the system first selects the route with the smaller MED value as the best route for the autonomous system.

Examples # Devices A and B belong to AS100 and device C belongs to AS200. C is the peer of A and B. Configure the MED of A as 25 to make C select the path from B.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] default med 25
```

default-route imported (IPv6 address family view)

Syntax **default-route imported**

undo default-route imported

View IPv6 address family view

Parameters None

Description Use the **default-route imported** command to enable the redistribution of default route into the IPv6 BGP routing table.

Use the **undo default-route imported** command to disable the redistribution.

By default, the redistribution is not enabled.

Examples # Enable the redistribution of default route from OSPFv3 into IPv6 BGP.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] default-route imported
[Sysname-bgp-af-ipv6] import-route ospfv3 1
```

display bgp ipv6 group

Syntax **display bgp ipv6 group** [*ipv6-group-name*]

View Any view

Parameters *ipv6-group-name*: Peer group name, a string of 1 to 47 characters.

Description Use the **display bgp ipv6 group** command to display IPv6 peer group information.

If no *ipv6-group-name* is specified, information about all peer groups is displayed.

Examples # Display the information of the IPv6 peer group **aaa**.

```
<Sysname> display bgp ipv6 group aaa

 BGP peer-group is aaa
 remote AS number not specified
 Type : external
 Maximum allowed prefix number: 4294967295
 Threshold: 75%
 Configured hold timer value: 180
 Keepalive timer value: 60
 Minimum time between advertisement runs is 30 seconds
 Peer Preferred Value: 0
 No routing policy is configured
  Members:
  Peer        V    AS  MsgRcvd  MsgSent  OutQ PrefRcv Up/Down  State

  20:20::20:1  4   200       170       141      0        2 02:13:35 Established
```

Table 287 Description on the fields of the display bgp ipv6 group command

Field	Description
BGP peer-group	Name of the peer group
remote AS	AS number of the peer group
Type	Type of the peer group
Maximum allowed prefix number	Maximum allowed prefix number
Threshold	Threshold value
hold timer value	Holdtime
Keepalive timer value	Keepalive interval
Minimum time between advertisement runs	Minimum interval between advertisements
Peer Preferred Value	Preferred value of the routes from the peer
No routing policy is configured	No routing policy is configured for the peer
Members	Group members
Peer	IPv6 address of the peer
V	Peer BGP version
AS	AS number
MsgRcvd	Number of messages received
MsgSent	Number of messages sent
OutQ	Number of messages to be sent
PrefRcv	Number of prefixes received
Up/Down	The lasting time of a session/the lasting time of present state (when no session is established)
State	State machine of peer

display bgp ipv6 network

Syntax **display bgp ipv6 network**

View Any view

Parameters None

Description Use the **display bgp ipv6 network** command to display IPv6 routes advertised with the **network** command.

Examples # Display IPv6 routes advertised with the **network** command.

```
<Sysname> display bgp ipv6 network
  BGP Local Router ID is 1.1.1.2.
  Local AS Number is 200.
  Network          Mask            Route-policy        Short-cut

  2002::           64
  2001::           64                                  Short-cut
```

Table 288 Description on the fields of the display bgp ipv6 network command

Field	Description
BGP Local Router ID	BGP Local Router ID
Local AS Number	Local AS Number
Network	Network address
Prefix	Prefix length
Route-policy	Routing policy
Short-cut	Shortcut route

display bgp ipv6 paths

Syntax **display bgp ipv6 paths** [*as-regular-expression*]

View Any view

Parameters *as-regular-expression*: AS path regular expression.

Description Use the **display bgp ipv6 paths** command to display IPv6 BGP path information.

If no parameter is specified, all path information will be displayed.

Examples # Display IPv6 BGP path information.

```
<Sysname> display bgp ipv6 paths

    Address        Hash     Refcount  MED          Path/Origin
    0x5917098      1        1          0             i
    0x59171D0      9        2          0             100i
```

Table 289 Description on the fields of the display bgp ipv6 paths command

Field	Description
Address	Route destination address in local database, in dotted hexadecimal notation
Hash	Hash index
Refcount	Count of routes that used the path
MED	MED of the path

Table 289 Description on the fields of the display bgp ipv6 paths command

Field	Description	
Path	AS_PATH attribute of the path, recording the ASs it has passed, for avoiding routing loops	
Origin	Origin attribute of the route, which can take on one of the following values:	
	i	Indicates the route is interior to the AS. Summary routes and routes defined using the **network** command are considered IGP routes.
	e	Indicates that a route is learned from the exterior gateway protocol (EGP).
	?	Short for INCOMPLETE. It indicates that the origin of a route is unknown and the route is learned by other means. BGP sets Origin attribute of routes learned from other IGP protocols to INCOMPLETE.

display bgp ipv6 peer

Syntax **display bgp ipv6 peer** [*group-name* **log-info** | *ipv4-address* **verbose** | *ipv6-address* { **log-info** | **verbose** }]

View Any view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

Ipv4-address: IPv4 address of a peer.

ipv6-address: Specifies the IPv6 address of a peer to be displayed.

log-info: Displays log information of the specified peer.

verbose: Displays the detailed information of the peer.

Description Use the **display bgp ipv6 peer** command to display peer/peer group information.

If no parameter specified, information about all peers and peer groups is displayed.

Examples # Display all IPv6 peer information.

```
<Sysname> display bgp ipv6 peer

 BGP Local router ID : 20.0.0.1
 local AS number : 100
Total number of peers : 1                 Peers in established state : 1

Peer      V    AS  MsgRcvd  MsgSent  OutQ PrefRcv  Up/Down    State

20::21    4   200  17       19       0          3  00:09:59   Established
```

Table 290 Description on the fields of the display bgp ipv6 peer command

Field	Description
Peer	IPv6 address of the peer
V	Peer BGP version
AS	AS number
MsgRcvd	Messages received
MsgSent	Messages sent
OutQ	Messages to be sent
PrefRcv	Number of prefixes received
Up/Down	The lasting time of a session/the lasting time of present state (when no session is established)
State	Peer state

display bgp ipv6 routing-table

Syntax **display bgp ipv6 routing-table** [*ipv6-address prefix-length*]

View Any view

Parameters *ipv6-address*: Destination IPv6 address.

prefix-length: Prefix length of the IPv6 address, in the range 0 to 128.

Description Use the **display bgp ipv6 routing-table** command to display IPv6 BGP routing table information.

Examples # Display the IPv6 BGP routing table.

```
<Sysname> display bgp ipv6 routing-table

 Total Number of Routes: 2

 BGP Local router ID is 30.30.30.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *>  Network : 30:30::                                  PrefixLen : 64
     NextHop : 30:30::30:1                              LocPrf    :
     PrefVal : 0                                        Label     : NULL
     MED     : 0
     Path/Ogn: i

 *>  Network : 40:40::                                  PrefixLen : 64
     NextHop : 40:40::40:1                              LocPrf    :
     PrefVal : 0                                        Label     : NULL
     MED     : 0
     Path/Ogn: i
```

Table 291 Description on the fields of the display bgp ipv6 routing-table command

Field	Description
Local router ID	Local router ID

Table 291 Description on the fields of the display bgp ipv6 routing-table command

Field	Description	
Status codes	Status codes: * - valid > - best d - damped h - history i - internal (IGP) s - summary suppressed (suppressed) S - Stale	
Origin	i - IGP (originated in the AS) e - EGP (learned through EGP) ? - incomplete (learned by other means)	
Network	Destination network address	
PrefixLen	Prefix length	
NextHop	Next Hop	
MED	MULTI_EXIT_DISC attribute	
LocPrf	Local preference value	
Path	AS_PATH attribute, recording the ASs the packet has passed to avoid routing loops	
PrefVal	Preferred value	
Label	Label	
Ogn	Origin attribute of the route, which can take on one of the following values:	
	i	Indicates that a route is interior to the AS. Summary routes and the routes configured using the **network** command are considered IGP routes.
	e	Indicates that a route is learned from the exterior gateway protocol (EGP).
	?	Short for INCOMPLETE. It indicates that the origin of a route is unknown and the route is learned by other means. BGP sets Origin attribute of routes learned from other IGP protocols to INCOMPLETE.

display bgp ipv6 routing-table as-path-acl

Syntax **display bgp ipv6 routing-table as-path-acl** *as-path-acl-number*

View Any view

Parameters *as-path-acl-number*: Number of an AS path ACL permitted by which to display routing information, ranging from 1 to 256.

Description Use the **display bgp ipv6 routing-table as-path-acl** command to display routes filtered through the specified AS path ACL.

Examples # Display routes filtered through the AS path ACL 20.

```
<Sysname> display bgp ipv6 routing-table as-path-acl 20
 BGP Local router ID is 30.30.30.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *>  Network : 30:30::                                  PrefixLen : 64
     NextHop : 30:30::30:1                              LocPrf    :
     PrefVal : 0                                        Label     : NULL
     MED     : 0
     Path/Ogn: i
```

Refer to Table 291 for description on the fields above.

display bgp ipv6 routing-table community

Syntax **display bgp ipv6 routing-table community** [*aa:nn*&<1-13>] [**no-advertise** | **no-export** | **no-export-subconfed**] * [**whole-match**]

View Any view

Parameters *aa:nn*: Specifies a community number; both aa and nn are in the range 0 to 65535.

&<1-13>: Indicates the argument before it can be entered up to 13 times.

no-advertise: Displays routes not advertised to any peer.

no-export: Displays routes advertised outside the AS; if there is a confederation, it displays routes not advertised outside the confederation, but to other sub ASs in the confederation.

no-export-subconfed: Displays routes neither advertised outside the AS nor to other sub ASs if the confederation is configured.

whole-match: Displays the exactly matched routes.

Description Use the **display bgp ipv6 routing-table community** command to display the routing information of the specified community.

Examples # Display the routing information of the community no-export.

```
<Sysname> display bgp ipv6 routing-table community no-export
BGP Local router ID is 30.30.30.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *>  Network : 30:30::                                  PrefixLen : 64
     NextHop : 30:30::30:1                              LocPrf    :
     PrefVal : 0                                          Label     : NULL
     MED     : 0
     Path/Ogn: i
```

Refer to Table 291 for description on the fields above.

display bgp ipv6 routing-table community-list

Syntax **display bgp ipv6 routing-table community-list** { *basic-community-list-number* [**whole-match**] | *adv-community-list-number* }&<1-16>

View Any view

Parameters *basic-community-list-number*: Specifies a basic community-list number, in the range 1 to 99.

adv-community-list-number: Specifies an advanced community-list number, in the range 100 to 199.

whole-match: Displays routes exactly matching the specified *basic-community-list-number*.

&<1-16>: Specifies to allow entering the argument before it up to 16 times.

Description Use the **display bgp ipv6 routing-table community-list** command to view the routing information matching the specified IPv6 BGP community list.

Examples # Display the routing information matching the specified IPv6 BGP community list.

```
<Sysname> display bgp ipv6 routing-table community-list 99
BGP Local router ID is 30.30.30.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *>  Network : 30:30::                                  PrefixLen : 64
     NextHop : 30:30::30:1                              LocPrf    :
     PrefVal : 0                                          Label     : NULL
     MED      : 0
     Path/Ogn: i
```

Refer to Table 291 for description on the fields above.

display bgp ipv6 routing-table dampened

Syntax **display bgp ipv6 routing-table dampened**

View Any view

Parameters None

Description Use the **display bgp ipv6 routing-table dampened** command to display the IPv6 BGP dampened routes.

Examples # Display IPv6 BGP dampened routes.

```
<Sysname> display bgp ipv6 routing-table dampened
```

```
BGP Local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *d  Network : 111::                                  PrefixLen : 64
     From    : 122::1                                    Reuse     : 00:29:34
     Path/Ogn: 200?
```

Table 292 Description on the fields of the display bgp ipv6 routing-table dampened command

Field	Description
From	Source IP address of a route
Reuse	Time for reuse

Refer to Table 291 for description on the fields above.

display bgp ipv6 routing-table dampening parameter

Syntax **display bgp ipv6 routing-table dampening parameter**

View Any view

Parameters None

Description Use the **display bgp ipv6 routing-table dampening parameter** command to display IPv6 BGP routing dampening parameters.

Related commands: **dampening (IPv6 address family view)**.

Examples # Display IPv6 BGP routing dampening parameters.

```
<Sysname> display bgp ipv6 routing-table dampening parameter
 Maximum Suppress Time(in second)     : 3069
 Ceiling Value                        : 16000
 Reuse Value                          : 750
 HalfLife Time(in  second)            : 900
 Suppress-Limit                       : 2000
```

Table 293 Description on the above fields

Field	Description
Maximum Suppress Time	Maximum Suppress Time
Ceiling Value	Upper limit of penalty value
Reuse Value	Reuse Value
HalfLife Time	Half life Time
Suppress-Limit	Suppress value

display bgp ipv6 routing-table different-origin-as

Syntax **display bgp ipv6 routing-table different-origin-as**

View Any view

Parameters None

Description Use the **display bgp ipv6 routing-table different-origin-as** command to display IPv6 BGP routes originating from different autonomous systems.

Examples # Display IPv6 BGP routes from different ASs.

```
<Sysname> display bgp ipv6 routing-table different-origin-as

 BGP Local router ID is 10.1.4.2
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *>  Network : 100::                                    PrefixLen : 64
     NextHop : 1::1                                     LocPrf    :
     PrefVal : 0                                        Label     : NULL
     MED     : 0
     Path/Ogn: 100 i

 *   Network : 100::                                    PrefixLen : 64
     NextHop : 2::1                                     LocPrf    :
     PrefVal : 0                                        Label     : NULL
     MED     : 0
     Path/Ogn: 300 i
```

Refer to Table 291 for description on the fields above.

display bgp ipv6 routing-table flap-info

Syntax **display bgp ipv6 routing-table flap-info** [**regular-expression** *as-regular-expression* | **as-path-acl** *as-path-acl-number* | *ipv6-address* [*prefix-length* [**longer-match**]]]

View Any view

Parameters *as-regular-expression*: AS path regular expression to be matched.

as-path-acl-number: Number of the specified AS path ACL to be matched, ranging from 1 to 256.

ipv6-address: IPv6 address of a route to be displayed.

prefix-length: Prefix length of the IPv6 address, in the range 1 to 128.

longer-match: Matches the longest prefix.

Description Use the **display bgp ipv6 routing-table flap-info** command to display IPv6 BGP route flap statistics.

Examples # Display IPv6 BGP route flap statistics.

```
<Sysname> display bgp ipv6 routing-table flap-info

 BGP Local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *d  Network  : 111::                                PrefixLen : 64
     From     : 122::1                               Flaps     : 3
     Duration : 00:13:47                             Reuse     : 00:16:36
     Path/Ogn : 200?
```

Table 294 Description on the fields of the display bgp ipv6 routing-table flap-info command

Field	Description
Flaps	Number of flaps
Duration	Flap duration
Reuse	Reuse time of the route

Refer to Table 291 for description on the fields above.

display bgp ipv6 routing-table label

Syntax **display bgp ipv6 routing-table label**

View Any view

Parameters None

Description Use the **display bgp ipv6 routing-table label** command to display IPv6 BGP label routing information.

Examples # Display IPv6 BGP label routing information.

```
<Sysname> display bgp ipv6 routing-table label
Total Number of Routes: 1

  Network              Prefix   NextHop                Label

  200::                96       ::FFFF:2.1.1.1         NULL/1024
```

Table 295 Description on the fields of the display bgp ipv6 routing-table label command

Field	Description
Network	Network address
Prefix	Prefix length
NextHop	Next hop
Label	MPLS label information

display bgp ipv6 routing-table peer

Syntax **display bgp ipv6 routing-table peer** { *ipv4-address* | *ipv6-address* } { **advertised-routes** | **received-routes** } [*network-address prefix-length* | **statistic**]

View Any view

Parameters *ipv4-address:* Specifies the IPv4 peer to be displayed.

ipv6-address: Specifies the IPv6 peer to be displayed.

advertised-routes: Routing information advertised to the specified peer.

received-routes: Routing information received from the specified peer.

network-address prefix-length: IPv6 address and prefix length. The prefix length ranges from 0 to 128.

statistic: Displays route statistics.

Description Use the **display bgp ipv6 routing-table peer** command to display the routing information advertised to or received from the specified IPv4 or IPv6 BGP peer.

Examples # Display the routing information advertised to the specified BGP peer.

```
<Sysname> display bgp ipv6 routing-table peer 10:10::10:1 advertised-routes
 Total Number of Routes: 2

 BGP Local router ID is 20.20.20.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *>  Network : 20:20::                                  PrefixLen : 64
     NextHop : 20:20::20:1                              LocPrf    :
     PrefVal : 0                                        Label     : NULL
     MED     : 0
     Path/Ogn: i

 *>  Network : 40:40::                                  PrefixLen : 64
     NextHop : 30:30::30:1                              LocPrf    :
     PrefVal : 0                                        Label     : NULL

     MED     : 0
     Path/Ogn: 300 i
```

Refer to Table 291 for description on the fields above.

display bgp ipv6 routing-table regular-expression

Syntax **display bgp ipv6 routing-table regular-expression** *as-regular-expression*

View Any view

Parameters *as-regular-expression*: AS regular expression.

Description Use the **display bgp ipv6 routing-table regular-expression** command to display the routes permitted by the specified AS regular expression.

Examples # Display routing information matching the specified AS regular expression.

```
<Sysname> display bgp ipv6 routing-table regular-expression ^100

 BGP Local router ID is 20.20.20.1
 Status codes: * - valid, > - best, d - damped,
               h - history,  i - internal, s - suppressed, S - Stale
               Origin : i - IGP, e - EGP, ? - incomplete

 *>  Network : 50:50::                                  PrefixLen : 64
     NextHop : 10:10::10:1                             LocPrf    :
     PrefVal : 0                                       Label     : NULL
     MED     : 0
     Path/Ogn: 100 i
```

Refer to Table 291 for description on the fields above.

display bgp ipv6 routing-table statistic

Syntax **display bgp ipv6 routing-table statistic**

View Any view

Parameters None

Description Use the **display bgp ipv6 routing-table statistic** command to display IPv6 BGP routing statistics.

Examples # Display IPv6 BGP routing statistics.

```
<Sysname> display bgp ipv6 routing-table statistic
 Total Number of Routes: 1
```

filter-policy export(IPv6 address family view)

Syntax **filter-policy** { *acl6-number* | **ipv6-prefix** *ipv6-prefix-name* } **export** [*protocol process-id*]

undo filter-policy export [*protocol process-id*]

View IPv6 address family view

Parameters *acl6-number*: Specifies the number of an ACL6 used to match against the destination of routing information. The number is in the range 2000 to 3999.

ipv6-prefix-name: Specifies the name of an IPv6 prefix list used to match against the destination address field of routing information. The name is a string of 1 to 19 characters.

protocol: Filters routes redistributed from the routing protocol. It can be **direct**, **isisv6**, **ospfv3**, **ripng**, and **static** at present. If no protocol is specified, all routes will be filtered when advertised.

process-id: Process ID of the routing protocol, in the range 1 to 65535. It is available only when the protocol is **isisv6**, **ospfv3** or **ripng**.

Description Use the **filter-policy export** command to filter outbound routes using a specified filter.

Use the **undo filter-policy export** command to cancel filtering outbound routes.

By default, no outbound routing information is filtered.

If a protocol is specified, only routes redistributed from the specified protocol are filtered. If no protocol is specified, all redistributed routes will be filtered.

Examples # Reference ACL6 2001 to filter all outbound IPv6 BGP routes.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] filter-policy 2001 export
```

filter-policy import (IPv6 address family view)

Syntax **filter-policy** { *acl6-number* | **ipv6-prefix** *ipv6-prefix-name* } **import**

undo filter-policy import

View IPv6 address family view

Parameters *acl6-number*: Number of an IPv6 ACL used to match against the destination address field of routing information, ranging from 2000 to 3999.

ipv6-prefix-name: Name of an IPv6 prefix list used to match against the destination address field of routing information, a string of 1 to 19 characters.

Description Use the **filter-policy import** command to filter inbound routing information using a specified filter.

Use the **undo filter-policy import** command to cancel filtering inbound routing information.

By default, no inbound routing information is filtered.

Examples # Reference ACL6 2001 to filter all inbound routes.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] filter-policy 2001 import
```

group (IPv6 address family view)

Syntax **group** *ipv6-group-name* [**internal** | **external**]

undo group *ipv6-group-name*

View IPv6 address family view

Parameters *ipv6-group-name*: Name of an IPv6 peer group, a string of 1 to 47 characters.

internal: Creates an IBGP peer group.

external: Creates an EBGP peer group, which can be a group of another sub AS in the confederation.

Description Use the **group** command to create a peer group.

Use the **undo group** command to delete a peer group.

An IBGP peer group will be created if neither **internal** nor **external** is selected.

Examples # Create an IBGP peer group named **test**.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname] ipv6-family
[Sysname-bgp-af-ipv6] group test
```

import-route (IPv6 address family view)

Syntax **import-route** *protocol* [*process-id* [**med** *med-value* | **route-policy** *route-policy-name*] *]

undo import-route *protocol* [*process-id*]

View IPv6 address family view

Parameters *protocol*: Redistributes routes from the specified protocol, which can be **direct**, **isisv6**, **ospfv3**, **ripng**, or **static** at present.

process-id: Process ID, in the range 1 to 65535. The default is 1. It is available only when the protocol is **isisv6**, **ospfv3** or **ripng**.

med-value: Applies the MED value to redistributed routes. The value is in the range 0 to 4294967295. If not specified, the cost of the redistributed route is used as its MED in the IPv6 BGP routing domain.

route-policy-name: Name of a routing policy used to filter redistributed routes, a string of 1 to 19 characters.

Description Use the **import-route** command to redistribute routes from another routing protocol.

Use the **undo import-route** command to remove the configuration.

By default, IPv6 BGP does not redistribute routes from any routing protocol.

The routes redistributed using the **import-route** command has the incomplete origin attribute.

Examples # Redistribute routes from RIPng 1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] import-route ripng 1
```

ipv6-family

Syntax **ipv6-family**

undo ipv6-family

View BGP view

Parameters None

Description Use the **ipv6-family** command to enter IPv6 address family view.

Use the **undo ipv6-family** command to remove all configurations from the view.

IPv4 BGP unicast view is the default.

Examples # Enter IPv6 address family view.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
```

network (IPv6 address family view)

Syntax **network** *ipv6-address prefix-length* [**short-cut** | **route-policy** *route-policy-name*]

undo network *ipv6-address prefix-length* [**short-cut**]

View IPv6 address family view

Parameters *ipv6-address*: IPv6 address.

prefix-length: Prefix length of the address, in the range 0 to 128.

short-cut: If the keyword is specified for an EBGP route, the route will use the local routing management value rather than that of EBGP routes, so the preference of the route is reduced.

route-policy-name: Name of a routing policy, a string of 1 to 19 characters.

Description Use the **network** command to advertise a network to the IPv6 BGP routing table.

Use the **undo network** command to remove an entry from the IPv6 BGP routing table.

By default, no route is advertised.

Note that:

- The route to be advertised must exist in the local IP routing table, and using a routing policy makes route management more flexible.
- The route advertised to the BGP routing table using the **network** command has the IGP origin attribute.

Examples # Advertise the network 2002::/16 into the IPv6 BGP routing table.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] network 2002:: 16
```

peer advertise-community (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **advertise-community**

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **advertise-community**

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

Description Use the **peer advertise-community** command to advertise the community attribute to a peer/peer group.

Use the **undo peer advertise-community** command to remove the configuration.

By default, no community attribute is advertised to any peer group/peer.

Examples # Advertise the community attribute to the peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 advertise-community
```

peer advertise-ext-community (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **advertise-ext-community**

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **advertise-ext-community**

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

Description Use the **peer advertise-ext-community** command to advertise the extended community attribute to a peer/peer group.

Use the **undo peer advertise-ext-community** command to remove the configuration.

By default, no extended community attribute is advertised to a peer/peer group.

Examples # Advertise the extended community attribute to the peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 advertise-ext-community
```

peer allow-as-loop (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **allow-as-loop** [*number*]

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **allow-as-loop**

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

number: Specifies the repeating times of the local AS number, in the range 1 to 10. The default number is 1.

Description Use the **peer allow-as-loop** command to configure IPv6 BGP to allow the local AS number to exist in the AS_PATH attribute of routes from a peer/peer group, and to configure the repeating times of the local AS number.

Use the **undo peer allow-as-loop** command to disable the function.

The local AS number is not allowed to exist in the AS PATH attribute of routes by default.

Examples # Configure the repeating times of the local AS number allowed in the AS PATH of routes from peer 1::1 as 2.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1::1 allow-as-loop 2
```

peer as-number (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **as-number** *as-number*

undo peer *ipv6-group-name* **as-number**

undo peer *ipv6-address*

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

as-number: AS number of the peer/peer group, in the range 1 to 65535.

Description Use the **peer as-number** command to specify an AS number for a peer/peer group.

Use the **undo peer as-number** command to delete the AS number of a peer group.

Use the **undo peer** command to delete a peer.

By default, no AS number is configured for a peer/peer group.

Examples # Specify the AS number of the peer group test as 100.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test external
[Sysname-bgp-af-ipv6] peer test as-number 100
```

peer as-path-acl (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **as-path-acl** *as-path-acl-number* { **import** | **export** }

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **as-path-acl** *as-path-acl-number* { **import** | **export** }

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

as-path-acl-number: Number of an AS path ACL, in the range 1 to 256.

import: Filters incoming routes.

export: Filters outgoing routes.

Description Use the **peer as-path-acl** command to specify an AS path ACL to filter routes incoming from or outgoing to a peer/peer group.

Use the **undo peer as-path-acl** command to remove the configuration.

By default, no AS path list is specified for filtering.

Examples # Specify the AS path ACL 3 to filter routes outgoing to the peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] ip as-path-acl 3 permit ^200
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 as-path-acl 3 export
```

peer capability-advertise route-refresh

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **capability-advertise route-refresh**

undo peer { *ipv6-group-name* | *ipv6-address* } **capability-advertise route-refresh**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

Description Use the **peer capability-advertise route-refresh** command to enable IPv6 BGP route-refresh.

Use the **undo peer capability-advertise route-refresh** command to disable the function.

By default, route-refresh is enabled.

Examples # Disable route-refresh of peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 as-number 100
[Sysname-bgp-af-ipv6] undo peer 1:2::3:4 capability-advertise route-refresh
```

peer connect-interface (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **connect-interface** *interface-type interface-number*

undo peer { *ipv6-group-name* | *ipv6-address* } **connect-interface**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

interface-type interface-number: Specifies the type and name of the interface.

Description Use the **peer connect-interface** command to specify the source interface for establishing TCP connections to an IPv6 BGP peer or peer group.

Use the **undo peer connect-interface** command to restore the default.

By default, BGP uses the outbound interface of the best route to the IPv6 BGP peer/peer group as the source interface for establishing a TCP connection.

Note that:

To establish multiple BGP connections to a BGP router, you need to specify on the local router the respective source interfaces for establishing TCP connections to the peers on the peering BGP router; otherwise, the local BGP router may fail to establish TCP connections to the peers when using the outbound interfaces of the best routes as the source interfaces.

Examples # Specify loopback0 as the source interface for routing updates to peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 connect-interface loopback 0
```

peer default-route-advertise

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **default-route-advertise** [**route-policy** *route-policy-name*]

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **default-route-advertise**

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

route-policy-name: Route-policy name, a string of 1 to 19 characters.

Description Use the **peer default-route-advertise** command to advertise a default route to a peer/peer group.

Use the **undo peer default-route-advertise** command to disable advertising a default route.

By default, no default route is advertised to a peer/peer group.

Using this command does not require the default route available in the routing table. With this command used, the router sends the default route unconditionally to the peer/peer group with the next hop being itself.

Examples # Advertise a default route to peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 default-route-advertise
```

peer description (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **description** *description-text*

undo peer { *ipv6-group-name* | *ipv6-address* } **description**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

description-text: Description information for the peer/peer group, a string of 1 to 79 characters.

Description Use the **peer description** command to configure the description information for a peer/peer group.

Use the **undo peer description** command to remove the description information of a peer/peer group.

By default, no description information is configured for a peer (group).

You need create a peer/peer group before configuring a description for it.

Examples # Configure the description for the peer group **test** as ISP1.

```
<Sysname] system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test external
[Sysname-bgp-af-ipv6] peer test description ISP1
```

peer ebgp-max-hop (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **ebgp-max-hop** [*hop-count*]

undo peer { *ipv6-group-name* | *ipv6-address* } **ebgp-max-hop**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

hop-count: Maximum hop count, in the range 1 to 255. By default, the value is 64.

Description Use the **peer ebgp-max-hop** command to allow establishing the EBGP connection to a peer/peer group indirectly connected.

Use the **undo peer ebgp-max-hop** command to remove the configuration.

By default, this feature is disabled.

You can use the argument *hop-count* to specify the maximum router hops of the EBGP connection.

Examples # Allow establishing the EBGP connection with the peer group **test** on an indirectly connected network.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test external
[Sysname-bgp-af-ipv6] peer test ebgp-max-hop
```

peer enable (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* } **enable**

undo peer { *group-name* | *ipv4-address* } **enable**

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 peer group, a string of 1 to 47 characters. The IPv4 peer group should be created beforehand.

ipv4-address: IPv4 address of a peer.

Description Use the **peer enable** command to enable an IPv4 peer or peer group.

Use the **undo peer enable** command to disable an IPv4 peer or peer group.

By default, no IPv4 peer or peer group is enabled.

If an IPv4 peer or peer group is disabled, the router will not exchange routing information with it.

Examples # Enable peer 1.1.1.1.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1.1.1.1 enable
```

peer fake-as (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **fake-as** *as-number*

undo peer { *ipv6-group-name* | *ipv6-address* } **fake-as**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

as-number: Local autonomous system number, in the range 1 to 65535.

Description Use the **peer fake-as** command to configure a fake local AS number for a peer or peer group.

Use the **undo peer fake-as** command to remove the configuration.

By default, no fake local AS number is configured for a peer or peer group.

Examples # Configure a fake AS number of 200 for the peer group test.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test external
[Sysname-bgp-af-ipv6] peer test fake-as 200
```

peer filter-policy (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **filter-policy** *acl6-number* { **import** | **export** }

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **filter-policy** [*acl6-number*] { **import** | **export** }

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

acl6-number: IPv6 ACL number, in the range 2000 to 3999.

import: Applies the filter-policy to routes received from the peer/peer group.

export: Applies the filter-policy to routes advertised to the peer/peer group.

Description Use the **peer filter-policy** command to configure an ACL-based filter policy for a peer or peer group.

Use the **undo peer filter-policy** command to remove the configuration.

By default, no ACL-based filter policy is configured for a peer or peer group.

Examples # Apply the ACL6 2000 to filter routes advertised to the peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] acl ipv6 number 2000
[Sysname-acl6-basic-2000] rule permit source 2001:1:: 64
[Sysname-acl6-basic-2000] quit
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 filter-policy 2000 export
```

peer group (IPv6 address family view)

Syntax **peer** { *ipv4-address* | *ipv6-address* } **group** *group-name* [**as-number** *as-number*]

undo peer *ipv6-address* **group** *group-name*

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

as-number: Specifies the AS number of the peer/peer group, in the range 1 to 65535.

Description Use the **peer group** command to add a peer to a configured peer group.

Use the **undo peer group** command to delete a specified peer from a peer group.

By default, the peer does not belong to any peer group.

Examples # Create a peer group named **test** and add the peer 1:2::3:4 to the peer group.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test external
[Sysname-bgp-af-ipv6] peer 1:2::3:4 as-number 200
[Sysname-bgp-af-ipv6] peer 1:2::3:4 group test
```

peer ignore (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **ignore**

undo peer { *ipv6-group-name* | *ipv6-address* } **ignore**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

Description Use the **peer ignore** command to terminate the session to a peer or peer group.

Use the **undo peer ignore** command to remove the configuration.

By default, a router can establish sessions with a peer or peer group.

After the **peer ignore** command is executed, the system terminates the active session(s) with the specified peer or peer group and clears all the related routing information. For a peer group, this means all the sessions with the peer group will be tore down.

Examples # Terminate the session with peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 ignore
```

peer ipv6-prefix

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **ipv6-prefix** *ipv6-prefix-name* { **import** | **export** }

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **ipv6-prefix** { **import** | **export** }

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

ipv6-prefix-name: IPv6 prefix list name, a string of 1 to 19 characters.

import: Applies the filtering policy to routes received from the specified peer/peer group.

export: Applies the filtering policy to routes advertised to the specified peer/peer group.

Description Use the **peer ipv6-prefix** command to specify an IPv6 prefix list to filter routes incoming from or outgoing to a peer or peer group.

Use the **undo peer ipv6-prefix** command to remove the configuration.

By default, no IPv6 prefix list is specified for filtering.

Examples # Reference the IPv6 prefix list **list 1** to filter routes outgoing to peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] ip ipv6-prefix list1 permit 2002:: 64
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 ipv6-prefix list1 export
```

peer keep-all-routes (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **keep-all-routes**

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **keep-all-routes**

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

Description Use the **peer keep-all-routes** command to save the original routing information from a peer or peer group, including even routes that failed to pass the inbound policy.

Use the **undo peer keep-all-routes** command to disable this function.

By default, the function is not enabled.

Examples # Save routing information from peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 keep-all-routes
```

peer label-route-capability (IPv6 address family view)

Syntax **peer** *ipv4-address* **label-route-capability**

undo peer *ipv4-address* **label-route-capability**

View IPv6 address family view

Parameters *ipv4-address*: IPv4 address of a peer.

Description Use the **peer label-route-capability** command to enable exchange of labeled IPv4 routes with the peer.

Use the **undo peer label-route-capability** command to disable exchange of labeled IPv4 routes with the peer.

By default, the feature is disabled.

Examples # Enable exchange of labeled IPv4 routes with peer 2.2.2.2.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 2.2.2.2 label-route-capability
```

peer log-change (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **log-change**

undo peer { *ipv6-group-name* | *ipv6-address* } **log-change**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

Description Use the **peer log-change** command to enable the logging of session state and event information of a specified peer or peer group.

Use the **undo peer log-change** command to remove the configuration.

The logging is enabled by default.

Examples # Enable the logging of session state and event information of peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 log-change
```

peer next-hop-local (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **next-hop-local**

undo peer { *ipv6-group-name* | *ipv6-address* } **next-hop-local**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

Description Use the **peer next-hop-local** command to configure the next hop of routes advertised to a peer/peer group as the local router.

Use the **undo peer next-hop-local** command to restore the default.

By default, the system sets the next hop of routes advertised to an EBGP peer/peer group to the local router, but does not set for routes outgoing to an IBGP peer/peer group.

Examples # Set the next hop of routes advertised to EBGP peer group **test** to the router itself.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test external
[Sysname-bgp-af-ipv6] peer test next-hop-local
```

peer preferred-value (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **preferred-value** *value*

undo peer { *ipv6-group-name* | *ipv6-address* } **preferred-value**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

value: Preferred value, in the range 0 to 65535.

Description Use the **peer preferred-value** command to assign a preferred value to routes received from a peer or peer group.

Use the **undo peer preferred-value** command to restore the default.

By default, routes received from a peer or peer group have a preferred value of 0.

Routes learned from peers each have an initial preferred value. Among multiple routes to the same destination, the route with the biggest value is selected.

Note that:

If you both reference a routing policy and use the command **peer** { *ipv6-group-name* | *ipv6-address* } **preferred-value** *value* to set a preferred value for routes from a peer, the routing policy sets a non-zero preferred value for routes matching it. Other routes not matching the routing policy uses the value set with the command. If the preferred value in the routing policy is zero, the routes matching it will also use the value set with the command. For information about using a routing policy to set a preferred value, refer to "peer group (IPv6 address family view)" on page 1251 and **"peer route-policy (IPv6 address family view)" on page 1258** { **import** | **export** } in this document and "apply preferred-value" on page 1194.

Examples # Configure the preferred value as 50 for routes from peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 preferred-value 50
```

peer public-as-only (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **public-as-only**

undo peer { *ipv6-group-name* | *ipv6-address* } **public-as-only**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

Description Use the **peer public-as-only** command to configure IPv6 BGP updates to a peer/peer group to not carry private AS numbers.

Use the **undo peer public-as-only** command to allow IPv6 BGP updates to a peer/peer group to carry private AS numbers.

By default, BGP updates carry the private AS number.

The command does not take effect if the BGP update has both the public AS number and private AS number. The range of private AS number is from 64512 to 65535.

Examples # Carry no private AS number in BGP updates sent to the peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 public-as-only
```

peer reflect-client (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **reflect-client**

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **reflect-client**

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

Description Use the **peer reflect-client** command to configure the router as a route reflector and specify a peer/peer group as a client.

Use the **undo peer reflect-client** command to remove the configuration.

By default, neither route reflector nor client is configured.

Related commands: **reflect between-clients (IPv6 address family view)** and **reflector cluster-id (IPv6 address family view)**.

Examples # Configure the local device as a route reflector and specify the peer group **test** as a client.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test
[Sysname-bgp-af-ipv6] peer test reflect-client
```

peer route-limit (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **route-limit** *limit* [*percentage*]

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **route-limit**

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

limit: Specifies an upper limit from 1 to 10000 for address prefixes that can be received from the peer or peer group

percentage: Specifies the percentage of routes to generate alarm information, ranging from 1 to 100, with the default as 75.

Description Use the **peer route-limit** command to set the maximum number of prefixes that can be received from a peer/peer group.

Use the **undo peer route-limit** command to restore the default.

By default, the router has no limit on prefixes from a peer/peer group.

The router will end the peer relation when the number of address prefixes received for the peer exceeds the limit.

Examples # Set the number of prefixes allowed to receive from the peer 1:2::3:4 to 10000.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 route-limit 10000
```

peer route-policy (IPv6 address family view)

Syntax **peer** { *group-name* | *ipv4-address* | *ipv6-address* } **route-policy** *route-policy-name* { **import** | **export** }

undo peer { *group-name* | *ipv4-address* | *ipv6-address* } **route-policy** *route-policy-name* { **import** | **export** }

View IPv6 address family view

Parameters *group-name*: Name of an IPv4 or IPv6 peer group, a string of 1 to 47 characters.

ipv4-address: IPv4 address of a peer.

ipv6-address: IPv6 address of a peer.

route-policy-name: Specifies route-policy name, a string of 1 to 19 characters.

import: Applies the routing policy to routes from the peer (group).

export: Applies the routing policy to routes to the peer (group).

Description Use the **peer route-policy** command to apply a routing policy to routes incoming from or outgoing to a peer or peer group.

Use the **undo peer route-policy** command to remove the configuration.

By default, no routing policy is specified for the peer (group).

Use of the **peer route-policy** command does not apply the **if-match interface** clause defined in the routing policy. Refer to ***if-match interface*** on page 1200.

Examples # Apply the routing policy test-policy to routes received from the peer group test.

```
<Sysname> system-view
[Sysname] route-policy test-policy permit node 10
[Sysname-route-policy] if-match cost 10
[Sysname-route-policy] apply cost 65535
[Sysname-route-policy] quit
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test external
[Sysname-bgp-af-ipv6] peer test route-policy test-policy import
```

peer route-update-interval (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **route-update-interval** *seconds*

undo peer { *ipv6-group-name* | *ipv6-address* } **route-update-interval**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

seconds: Specifies the minimum interval for sending the same update to a peer (group) from 5 to 600 seconds.

Description Use the **peer route-update-interval** command to specify the interval for sending the same update to a peer/peer group.

Use the **undo peer route-update-interval** command to restore the default.

By default, the interval is 15 seconds for the IBGP peer, and 30 seconds for the EBGP peer.

Examples # Specify the interval for sending the same update to the peer 1:2::3:4 as 10 seconds.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 as-number 100
[Sysname-bgp-af-ipv6] peer 1:2::3:4 route-update-interval 10
```

peer substitute-as (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **substitute-as**

undo peer { *ipv6-group-name* | *ipv6-address* } **substitute-as**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

Description Use the **peer substitute-as** command to substitute the local AS number for the AS number of a peer/peer group in the AS_PATH attribute.

Use the **undo peer substitute-as** command to remove the configuration.

The substitution is not configured by default.

Examples # Substitute the local AS number for the AS number of peer 1:2::3:4.

```
<Sysname> system-view
[Sysname] bgp 100
```

```
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] peer 1:2::3:4 substitute-as
```

peer timer (IPv6 address family view)

Syntax **peer** { *ipv6-group-name* | *ipv6-address* } **timer keepalive** *keepalive* **hold** *holdtime*

undo peer { *ipv6-group-name* | *ipv6-address* } **timer**

View IPv6 address family view

Parameters *ipv6-group-name*: Name of a peer group, a string of 1 to 47 characters.

ipv6-address: IPv6 address of a peer.

keepalive: Specifies the keepalive interval in seconds, ranging from 1 to 21845.

holdtime: Specifies the holdtime in seconds, ranging from 3 to 65535.

Description Use the **peer timer** command to configure keepalive interval and holdtime interval for a peer or peer group.

Use the **undo peer timer** command to restore the default.

keepalive interval defaults to 60 seconds, and *holdtime* interval defaults to 180 seconds

Note that:

- The timer configured with this command is preferred to the timer configured with the **timer** command.
- The holdtime interval must be at least three times the keepalive interval.

Related commands: **timer (IPv6 address family view)**.

Examples # Configure the keepalive interval and holdtime interval for the peer group test as 60 seconds and 180 seconds.

```
<Sysname] system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] group test external
[Sysname-bgp-af-ipv6] peer test timer keep-alive 60 hold 180
```

preference (IPv6 address family view)

Syntax **preference** { *external-preference internal-preference local-preference* | **route-policy** *route-policy-name* }

undo preference

View IPv6 address family view

Parameters *external-preference*: Preference of EBGP route learned from an EBGP peer, in the range 1 to 255.

internal-preference: Preference of IBGP route learned from an IBGP peer, in the range 1 to 255.

local-preference: Preference of IPv6 BGP local route, in the range 1 to 255.

route-policy-name: Routing policy name, a string of 1 to 19 characters. The routing policy can set a preference for routes passing it. To the routes filtered out, the default value applies.

Description Use the **preference** command to configure preferences for EBGP, IBGP, and local routes.

Use the **undo preference** command to restore the default.

The bigger the preference value is, the lower the preference is. The default values of *external-preference*, *internal-preference* and *local-preference* are 255, 255 and 130 respectively.

Examples # Configure preferences for EBGP, IBGP, and local routes as 20, 20 and 200.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] preference 20 20 200
```

reflect between-clients (IPv6 address family view)

Syntax **reflect between-clients**

undo reflect between-clients

View IPv6 address family view

Parameters None

Description Use the **reflect between-clients** command to enable route reflection between clients.

Use the **undo reflect between-clients** command to disable this function.

By default, route reflection between clients is enabled.

After a route reflector is configured, it reflects routes between clients. If the clients are fully meshed, it is recommended to disable route reflection on the route reflector to reduce costs.

Related commands: **reflector cluster-id (IPv6 address family view)** and **peer reflect-client (IPv6 address family view)**.

Examples # Enable route reflection between clients.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] reflect between-clients
```

reflector cluster-id (IPv6 address family view)

Syntax **reflector cluster-id** *cluster-id*

undo reflector cluster-id

View IPv6 address family view

Parameters *cluster-id*: Specifies the cluster ID of the route reflector, an integer from 1 to 4294967295 (the system translates it into an IPv4 address) or an IPv4 address.

Description Use the **reflector cluster-id** command to configure the cluster ID of the route reflector.

Use the **undo reflector cluster-id** command to remove the configured cluster ID.

By default, a route reflector uses its router ID as the cluster ID.

Usually, there is only one route reflector in a cluster, so the router ID of the route reflector identifies the cluster. If multiple route reflectors are configured to improve the stability of the network, you should use this command to configure the identical cluster ID for all the reflectors to avoid routing loops.

Related commands: **reflect between-clients (IPv6 address family view)** and **peer reflect-client (IPv6 address family view)**.

Examples # Set 50 as the cluster ID for the route reflector, which is one of multiple route reflectors in the cluster.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] reflector cluster-id 50
```

refresh bgp ipv6

Syntax **refresh bgp ipv6** { *ipv4-address* | *ipv6-address* | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** }

View User view

Parameters *ipv4-address*: Soft-resets the connection with an IPv4 BGP peer.

ipv6-address: Soft-resets the connection with an IPv6 BGP peer.

all: Soft-resets all IPv6 BGP connections.

external: Soft-resets EBGP connections.

group *ipv6-group-name*: Soft-resets connections with a peer group. The name of the peer group is a string of 1 to 47 characters.

internal: Soft-resets IBGP connections.

export: Performs soft reset in outbound direction.

import: Performs soft reset in inbound direction.

Description Use the **refresh bgp ipv6** command to soft reset specified IPv4/IPv6 BGP connections. With this feature, you can refresh the IPv4/IPv6 BGP routing table and apply a new available policy without tearing down IPv4/IPv6 BGP connections.

To perform IPv4/IPv6 BGP soft reset, all routers in the network should support route-refresh. If a router not supporting route refresh exists in the network, you need to use the **peer keep-all-routes** command on the local router to save all route updates before performing soft reset.

Examples # Soft reset inbound IPv6 BGP connections.

```
<Sysname> refresh bgp ipv6 all import
```

reset bgp ipv6

Syntax **reset bgp ipv6** { *as-number* | *ipv4-address* | *ipv6-address* [**flap-info**] | **all** | **group** *group-name* | **external** | **internal** }

View User view

Parameters *as-number*: Resets the IPv6 BGP connections to peers in the specified AS.

ipv4-address: Resets the connection to the specified IPv4 BGP peer.

ipv6-address: Resets the connection to the specified IPv6 BGP peer.

flap-info: Clears the history information of routing flaps.

all: Resets all IPv6 BGP connections.

group *group-name*: Resets the connections to the specified IPv6 BGP peer group.

external: Resets all the EBGP connections.

internal: Resets all the IBGP connections.

Description Use the **reset bgp ipv6** command to reset specified IPv4/IPv6 BGP connections.

Examples # Reset all the IPv6 BGP connections.

```
<Sysname> reset bgp ipv6 all
```

reset bgp ipv6 dampening

Syntax **reset bgp ipv6 dampening** [*ipv6-address prefix-length*]

View User view

Parameters *ipv6-address*: IPv6 address

prefix-length: Prefix length of the address, in the range 0 to 128.

Description Use the **reset bgp ipv6 dampening** command to clear route dampening information and release suppressed routes.

If no *ipv6-address prefix-length* is specified, all IPv6 route dampening information will be cleared.

Examples # Clear the damping information of routes to 2345::/64 and release suppressed routes.

```
<Sysname> reset bgp ipv6 dampening 2345:: 64
```

reset bgp ipv6 flap-info

Syntax **reset bgp ipv6 flap-info** [*ipv6-address/prefix-length* | **regexp** *as-path-regexp* | **as-path-acl** *as-path-acl-number*]

View User view

Parameters *ipv6-address*: Clears the flap statistics for the specified IPv6 address.

prefix-length: Prefix length of the address, in the range 1 to 128.

as-path-regexp: Clears the flap statistics for routes matching the AS path regular expression.

as-path-acl-number: Clears the flap statistics for routes matching the AS path ACL. The number is in the range 1 to 256.

Description Use the **reset bgp ipv6 flap-info** command to clear IPv6 routing flap statistics.

If no parameters are specified, the flap statistics of all the routes will be cleared

Examples # Clear the flap statistics of the routes matching AS path ACL 10.

```
<Sysname> system-view
[Sysname] ip as-path-acl 10 permit ^100.*200$
[Sysname] quit
<Sysname> reset bgp ipv6 flap-info as-path-acl 10
```

router-id

Syntax **router-id** *router-id*

undo router-id

View BGP view

Parameters *router-id*: Router ID in IP address format.

Description Use the **router-id** command to specify a router ID for the router.

Use the **undo router-id** command to remove a router ID.

To run IPv6 BGP protocol, a router must have a router ID, an unsigned 32-bit integer and the unique ID of the router in the AS.

A router ID can be configured manually. If not, the system will select a router ID automatically from the current interfaces' IPv4 addresses. The selection sequence is the highest IPv4 address of Loopback interfaces' addresses, then the highest IPv4 address of physical interfaces' addresses if no Loopback interfaces are configured.

Only when the interface with the router ID is removed or the manually configured router ID is removed, will the system select another Router ID. To improve network reliability, it is recommended to configure the IPv4 address of a loopback interface as the router ID.

Examples # Specify the router ID of the router as 10.18.4.221.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] router-id 10.18.4.221
```

synchronization (IPv6 address family view)

Syntax **synchronization**

undo synchronization

View IPv6 address family view

Parameters None

Description Use the **synchronization** command to enable the synchronization between IPv6 BGP and IGP.

Use the **undo synchronization** command to disable the synchronization.

The feature is disabled by default.

With this feature enabled and when a non-BGP router is responsible for forwarding packets in an AS, IPv6 BGP speakers in the AS cannot advertise routing information to other ASs unless all routers in the AS know the latest routing information.

By default, upon receiving an IPv6 IBGP route, the BGP router only checks whether the next hop is reachable before advertisement. If synchronization is enabled, the IBGP route can be advertised to EBGP peers only when the route is also advertised by the IGP.

Examples # Enable the route synchronization between IPv6 BGP and IGP.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] synchronization
```

timer (IPv6 address family view)

Syntax **timer keepalive** *keepalive* **hold** *holdtime*

undo timer

View IPv6 address family view

Parameters *keepalive*: Keepalive interval in seconds, ranging from 1 to 21845.

holdtime: Holdtime interval in seconds, ranging from 3 to 65535.

Description Use the **timer** command to specify IPv6 BGP keepalive interval and holdtime interval.

Use the **undo timer** command to restore the default.

By default, the keepalive and holdtime intervals are 60s and 180s respectively.

Note that:

- Timer configured using the peer timer command is preferred to the timer configured using the timer command.
- The holdtime interval must be at least three times the keepalive interval.
- The configured timer applies to all the IPv6 BGP peers. It becomes valid only after the corresponding IPv6 BGP connections are reset.

Related commands: **peer timer (IPv6 address family view)**.

Examples # Configure keepalive interval and holdtime interval as 60 and 180 seconds.

```
<Sysname> system-view
[Sysname] bgp 100
[Sysname-bgp] ipv6-family
[Sysname-bgp-af-ipv6] timer keepalive 60 hold 180
```

83 IPv6 IS-IS CONFIGURATION COMMANDS

IPv6 IS-IS supports all the features of IPv4 IS-IS except that it advertises IPv6 routing information instead. This document describes only IPv6 IS-IS exclusive commands. Refer to "IS-IS Configuration Commands" on page 1037 for other IS-IS configuration commands.

display isis route ipv6

Syntax **display isis route ipv6** [[**level-1** | **level-2**] | **verbose**]* [*process-id*]

View Any view

Parameters **verbose**: Displays detailed IPv6 IS-IS routing information.

process-id: IS-IS process ID, in the range 1 to 65535.

level-1: Display Level-1 IPv6 IS-IS routes only.

level-2: Displays Level-2 IPv6 IS-IS routes only.

If no level is specified, both Level-1 and Level-2 (namely Level-1-2) routing information will be displayed.

Description Use the **display isis route ipv6** command to display IPv6 IS-IS routing information.

Examples # Display IPv6 IS-IS routing information.

```
<Sysname> display isis route ipv6
                        Route information for ISIS(1)
                        -----------------------------
                    ISIS(1) IPv6 Level-1 Forwarding Table
                    -------------------------------------
 Destination: 2001:1::                              PrefixLen: 64

Table 297 Description on the fields of the display isis route ipv6 verbose command

Field	Description
Interface	Outbound interface
ExitIndex	Outbound interface index

ipv6 default-route-advertise

Syntax **ipv6 default-route-advertise** [[**level-1** | **level-2** | **level-1-2**] | **route-policy** *route-policy-name*]*

undo ipv6 default-route-advertise [**route-policy** *route-policy-name*]

View IS-IS view

Parameters *route-policy-name*: Specifies the name of a routing policy with a string of 1 to 19 characters.

level-1: Specifies the default route as Level-1.

level-2: Specifies the default route as Level-2.

level-1-2: Specifies the default route as Level-1-2.

If no level is specified, the default route belongs to Level-2.

Description Use the **ipv6 default-route-advertise** command to generate a Level-1 or Level-2 IPv6 IS-IS default route.

Use the **undo ipv6 default-route-advertise** command to disable generating a default route.

No IPv6 IS-IS default route is generated by default.

With a routing policy, you can configure IPv6 IS-IS to generate the default route that must match the routing policy. You can use the **apply isis level-1** command in routing policy view to generate a default route in L1 LSPs, or use the **apply isis level-2** command in routing policy view to generate a default route in L2 LSPs, and use the **apply isis level-1-2** in routing policy view to generate a default route in L1 and L2 LSPs respectively.

Refer to "apply isis" on page 1191 for information about the **apply isis** command.

Examples # Configure the router to generate a default route in Level-2 LSPs.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] ipv6 default-route-advertise
```

ipv6 enable

Syntax **ipv6 enable**

undo ipv6 enable

View IS-IS view

Parameters None

Description Use the **ipv6 enable** command to enable IPv6 for the IPv6 IS-IS process.

Use the **undo ipv6 enable** command to disable IPv6.

IPv6 is disabled by default.

To run IPv6 IS-IS, you need enable global IPv6 capability, create an IS-IS process with the **isis** command, set a NET for the router with the **network-entity** command, then use the **ipv6 enable** command to enable IPv6 for the process, finally use the **isis ipv6 enable** command on relevant IS-IS interfaces to enable IPv6 for them.

Examples # Create IS-IS routing process 1, and enable IPv6 for the process.

```
<Sysname> system-view
[Sysname] ipv6
[Sysname] isis 1
[Sysname-isis-1] network-entity 10.0001.1010.1020.1030.00
[Sysname-isis-1] ipv6 enable
```

ipv6 filter-policy export

Syntax **ipv6 filter-policy** { *acl6-number* | **ipv6-prefix** *ipv6-prefix-name* | **route-policy** *route-policy-name* } **export** [*protocol* [*process-id*]]

undo ipv6 filter-policy export [*protocol* [*process-id*]]

View IS-IS view

Parameters *acl6-number*: Number of a basic or advanced IPv6 ACL used to filter redistributed routes before advertisement, ranging from 2000 to 3999. Refer to "IPv6 ACL Configuration Commands" on page 2103 for ACL information.

ipv6-prefix-name: Name of an IPv6 prefix list used to filter the redistributed routes before advertisement, a string of 1 to 19 characters. Refer to "IPv6 Routing Policy Configuration Commands" on page 1213 for IPv6 prefix list information.

route-policy-name: Name of a routing policy used to filter the redistributed routes before advertisement, a string of 1 to 19 characters. Refer to "Routing Policy

Common Configuration Commands" on page 1187 for routing policy information.

protocol: Filter routes redistributed from the specified routing protocol before advertisement. The routing protocol can be **bgp4+**, **direct**, **isisv6**, **ospfv3**, **ripng** or **static** at present. If no protocol is specified, routes redistributed from all protocols are filtered before advertisement.

process-id: Process ID of the routing protocol, ranging from 1 to 65535. This argument is available when the protocol is **isisv6**, **ospfv3** or **ripng**.

Description Use the **ipv6 filter-policy export** command to configure IPv6 IS-IS to filter redistributed routes before advertisement.

Use the **undo ipv6 filter-policy export** command to disable the filtering.

The filtering is disabled by default.

In some cases, only routes satisfying certain conditions will be advertised. You can configure the filtering conditions using the **ipv6 filter-policy** command.

You can use the **ipv6 filter-policy export** command, which filters redistributed routes only when they are advertised to other routers, in combination with the **ipv6 import-route** command.

- If no protocol is specified, routes redistributed from all protocols are filtered before advertisement.
- If a protocol is specified, only routes redistributed from the protocol are filtered before advertisement.

Related commands: **ipv6 filter-policy import**.

Examples # Reference the ACL6 2006 to filter all the redistributed routes before advertisement.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] ipv6 filter-policy 2006 export
```

ipv6 filter-policy import

Syntax **ipv6 filter-policy** { *acl6-number* | **ipv6-prefix** *ipv6-prefix-name* | **route-policy** *route-policy-name* } **import**

undo ipv6 filter-policy import

View IS-IS view

Parameters *acl6-number*: Number of a basic or advanced IPv6 ACL used to filter incoming routes, ranging from 2000 to 3999.

ipv6-prefix-name: Name of an IPv6 prefix list used to filter incoming routes, a string of 1 to 19 characters.

route-policy-name: Name of a routing policy used to filter incoming routes, a string of 1 to 19 characters.

Description Use the **ipv6 filter-policy import** command to configure IPv6 IS-IS to filter the received routes.

Use the **undo ipv6 filter-policy import** command to disable the filtering.

The filtering is disabled by default.

In some cases, only the routing information satisfying certain conditions will be received. You can configure the filtering conditions using the **ipv6 filter-policy** command.

Related commands: **ipv6 filter-policy export**.

Examples # Reference the IPv6 ACL 2003 to filter the received routes.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] ipv6 filter-policy 2003 import
```

ipv6 import-route

Syntax **ipv6 import-route** *protocol* [*process-id*] [**allow-ibgp**] [**cost** *cost* | [**level-1** | **level-2** | **level-1-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

undo ipv6 import-route *protocol* [*process-id*]

View IS-IS view

Parameters *protocol*: Redistributes routes from a specified routing protocol, which can be **direct**, **static**, **ripng**, **isisv6**, **bgp4+** or **ospfv3**.

process-id: Process ID of the routing protocol of **ripng**, **isisv6** or **ospfv3**, in the range of 1 to 65535. The default is 1.

cost: Cost for redistributed routes, ranging from 0 to 4261412864.

level-1: Redistributes routes into Level-1 routing table.

level-2: Redistributes routes into Level-2 routing table.

level-1-2: Redistributes routes into Level-1 and Level-2 routing tables.

route-policy-name: Name of a routing policy used to filter routes when they are being redistributed, a string of 1 to 19 characters.

tag: Specifies an administrative tag number for the redistributed routes, in the range of 1 to 4294967295.

allow-ibgp: Allows redistributing IBGP routes. This keyword is optional when the *protocol* is **bgp4+**.

Description Use the **ipv6 import-route** command to enable IPv6 IS-IS to redistribute routes from another routing protocol.

Use the **undo ipv6 import-route** command to disable route redistribution.

Route redistribution is disabled by default.

If no level is specified, the routes are imported to Level-2 routing table by default.

IPv6 IS-IS considers redistributed routes as routes to destinations outside the local routing domain.

You can specify a cost and a level for redistributed routes.

CAUTION: *Using the* ***import-route bgp4+ allow-ibgp*** *command will redistribute both EBGP and IBGP routes. The redistributed IBGP routes may cause routing loops. Therefore, be cautious with this command.*

Examples # Configure IPv6-IS-IS to redistribute static routes and sets the cost 15 for them.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1]ipv6 import-route static cost 15
```

ipv6 import-route isisv6 level-2 into level-1

Syntax **ipv6 import-route isisv6 level-2 into level-1** [**filter-policy** { *acl6-number* | **ipv6-prefix** *ipv6-prefix-name* | **route-policy** *route-policy-name* } | **tag** *tag*]*

undo ipv6 import-route isisv6 level-2 into level-1

View IS-IS view

Parameters *acl6-number*: Number of a basic or advanced ACL6 used to filter routes when they are leaking from Level-2 to Level-1, ranging from 2000 to 3999.

ipv6-prefix-name: Name of an IPv6 prefix list used to filter routes when they are leaking from Level-2 to Level-1, a string of 1 to 19 characters.

route-policy-name: Name of a routing policy used to filter routes when they are leaking from Level-2 to Level-1, a string of 1 to 19 characters.

tag: Specifies an administrative tag number for the leaked routes, in the range of 1 to 4294967295.

Description Use the **ipv6 import-route isisv6 level-2 into level-1** to enable IPv6 IS-IS route leaking from Level-2 to Level-1.

Use the **undo ipv6 import-route isisv6 level-2 into level-1** command to disable the leaking.

The leaking is disabled by default.

The route leaking feature enables a Level-1-2 router to advertise routes destined to the Level-2 area and other Level-1 areas to the Level-1 and Level-1-2 routers in the local area.

Examples # Enable IPv6 IS-IS route leaking from Level-2 to Level-1.

```
<Sysname> system-view
[Sysname] isis 1
[Sysname-isis-1] ipv6 import-route isisv6 level-2 into level-1
```

ipv6 maximum load-balancing

Syntax **ipv6 maximum load-balancing** *number*

undo ipv6 maximum load-balancing

View IS-IS view

Parameters *number*: Maximum number of equivalent load-balanced routes.

Description Use the **ipv6 maximum load-balancing** command to configure the maximum number of equivalent load-balanced routes. Use the **undo ipv6 maximum load-balancing** command to restore the default.

Configure the maximum number of equivalent load-balanced routes according to the memory capacity.

Examples # Configure the maximum number of equivalent load-balanced routing as 2.

```
<Sysname> system-view
[Sysname] isis 100
[Sysname-isis-100] ipv6 maximum load-balancing 2
```

ipv6 preference

Syntax **ipv6 preference** { **route-policy** *route-policy-name* | *preference* } *

undo ipv6 preference

View IS-IS view

Parameters *preference*: Preference for IPv6 IS-IS, ranging from 1 to 255.

route-policy-name: Name of a routing policy, a string of 1 to 19 characters.

Description Use the **ipv6 preference** command to configure the preference for IPv6 IS-IS protocol.

Use the **undo ipv6 preference** command to configure the default preference for IPv6 IS-IS protocol.

The default preference is 15.

When a router runs multiple dynamic routing protocols at the same time, the system will assign a preference to each routing protocol. If several protocols find routes to the same destination, the route found by the protocol with the highest preference is selected.

Examples # Configure the preference of IPv6 IS-IS protocol as 20.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] ipv6 preference 20
```

ipv6 summary

Syntax **ipv6 summary** *ipv6-prefix prefix-length* [**avoid-feedback** | **generate_null0_route** | [**level-1** | **level-1-2** | **level-2**] | **tag** *tag*] *

undo ipv6 summary *ipv6-prefix prefix-length* [**level-1** | **level-1-2** | **level-2**]

View IS-IS view

Parameters *ipv6-prefix:* IPv6 prefix of the summary route.

prefix-length: Length of the IPv6 prefix, in the range of 0 to 128.

avoid-feedback: Specifies to avoid learning summary routes via routing calculation.

generate_null0_route: Generates the NULL 0 route to avoid routing loops.

level-1: Specifies to summarize only the routes redistributed to Level-1 area.

level-1-2: Specifies to summarize all the routes redistributed to Level-1 and Level-2 areas.

level-2: Specifies to summarize only the routes redistributed to Level-2 area.

tag: Value of an administrative tag, in the range of 1 to 4294967295.

*If no level is specified in the command, the default is **level-2**.*

Description Use the **ipv6 summary** command to configure an IPv6 IS-IS summary route.

Use the **undo ipv6 summary** command to remove the summary route.

Route summarization is disabled by default.

Configuring summary routes can reduce the size of the route table, LSPs and LSDB. Routes to be summarized can be IS-IS routes or redistributed routes. The cost of a summary route is the smallest cost among all summarized routes.

Examples # Configure a summary route of 2002::/32.

```
<Sysname> system-view
[Sysname] isis
[Sysname-isis-1] ipv6 summary 2002:: 32
```

isis ipv6 enable

Syntax **isis ipv6 enable** [*process-id*]

undo isis ipv6 enable

View Interface view

Parameters *process-id*: IS-IS process ID, ranging from 1 to 65535. The default is 1.

Description Use the **isis ipv6 enable** command to enable IPv6 for the specified IS-IS process on the interface.

Use the **undo isis ipv6 enable** command to disable the configuration.

IPv6 is disabled on the interface by default.

Examples # Enable global IPv6, create IS-IS routing process 1, enable IPv6 for the process, and enable IPv6 for the process on interface Serial 2/0.

```
<Sysname> system-view
[Sysname] ipv6
[Sysname] isis 1
[Sysname-isis-1] network-entity 10.0001.1010.1020.1030.00
[Sysname-isis-1] ipv6 enable
[Sysname-isis-1] quit
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ipv6 address 2002::1/64
[Sysname-Serial2/0] isis ipv6 enable 1
```

84 IPv6 OSPFv3 Configuration Commands

abr-summary (OSPFv3 area view)

Syntax **abr-summary** *ipv6-address prefix-length* [**not-advertise**]

undo abr-summary *ipv6-address prefix-length*

View OSPFv3 area view

Parameters *ipv6-address*: Destination IPv6 address of the summary route.

prefix-length: Prefix length of the destination IPv6 address, in the range 0 to 128. This argument specifies the number of consecutive 1s of the prefix, which defines the network ID.

not-advertise: Specifies not to advertise the summary IPv6 route.

Description Use the **abr-summary** command to configure an IPv6 summary route on an area border router.

Use the **undo abr-summary** command to remove an IPv6 summary route. Then the summarized routes are advertised.

By default, no route summarization is available on an ABR.

You can use this command only on an ABR to configure a summary route for the area. The ABR advertises only the summary route to other areas. Multiple contiguous networks may be available in an area, where you can summarize them with one route for advertisement.

Examples # Summarize networks 2000:1:1:1::/64 and 2000:1:1:2::/64 in Area 1 with 2000:1:1::/48.

```
<Sysname> system-view
[Sysname] ospfv3 1
[Sysname-ospfv3-1] area 1
[Sysname-ospfv3-1-area-0.0.0.1] abr-summary 2000:1:1:: 48
```

area (OSPFv3 view)

Syntax **area** *area-id*

View OSPFv3 view

Parameters *area-id*: ID of an area, a decimal integer (in the range of 0 to 4294967295 and changed to IPv4 address format by the system) or an IPv4 address.

Description Use the **area** command to enter OSPFv3 area view.

The undo form of the command is not available. An area is removed automatically if there is no configuration and no interface is up in the area.

Examples # Enter OSPFv3 Area 0 view.

```
<Sysname> system-view
[Sysname] ospfv3 1
[Sysname-ospfv3-1] area 0
[Sysname-ospfv3-1-area-0.0.0.0]
```

default cost

Syntax **default cost** *value*

undo default cost

View OSPFv3 view

Parameters *value*: Specifies a default cost for redistributed routes, in the range of 1 to 16777214.

Description Use the **default cost** command to configure a default cost for redistributed routes.

Use the **undo default cost** command to restore the default.

By default, the default cost is 1.

You need to configure the default cost value for redistributed routes to advertise them throughout the whole AS.

If multiple OSPFv3 processes are available, use of this command takes effect for the current process only.

Examples # Specify the default cost for redistributed routes as 10.

```
<Sysname> system-view
[Sysname] ospfv3 1
[Sysname-ospfv3-1] default cost 10
```

default-cost (OSPFv3 area view)

Syntax **default-cost** *value*

undo default-cost

View OSPFv3 area view

Parameters *value*: Specifies a cost for the default route advertised to the stub area, in the range of 0 to 65535. The default is 1.

Description Use the **default-cost** command to specify the cost of the default route to be advertised to the stub area.

Use the **undo-default-cost** command to restore the default value.

Use of this command is only available on the ABR that is connected to a stub area.

You have two commands to configure a stub area: **stub**, **defaulted-cost**. You need to use the **stub** command on routers connected to a stub area to configure the area as stub.

If multiple OSPFv3 processes are running, use of this command takes effect only for the current process.

Related commands: **stub(OSPFv3 area view)**.

Examples # Configure Area1 as a stub area, and specify the cost of the default route advertised to the stub area as 60.

```
<Sysname> system-view
[Sysname] ospfv3
[Sysname-ospfv3-1] area 1
[Sysname-ospfv3-1-area-0.0.0.1] stub
[Sysname-ospfv3-1-area-0.0.0.1] default-cost 60
```

display debugging ospfv3

Syntax **display debugging ospfv3**

View Any view

Parameters None

Description Use the **display debugging ospfv3** command to display global OSPFv3 debugging state information.

Examples # Display the global OSPFv3 debugging state information.

```
<Sysname> display debugging ospfv3
OSPFv3 External route calculation debugging is on
```

display ospfv3

Syntax **display ospfv3** [*process-id*]

View Any view

Parameters *process-id*: Specifies the ID of an OSPFv3 process, ranging from 1 to 65535.

Description Use the **display ospfv3** command to display OSPFv3 brief information. If no process ID is specified, OSPFv3 brief information about all processes will be displayed.

Examples # Display brief information about all OSPFv3 processes.

```
<Sysname> display ospfv3
Routing Process "OSPFv3 (1)" with ID 1.1.1.1
 SPF schedule delay 5 secs, Hold time between SPFs 10 secs
 Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
 Number of external LSA 0. These external LSAs' checksum Sum 0x0000
 Number of AS-Scoped Unknown LSA 0
 Number of LSA originated 3
 Number of LSA received 0
 Number of areas in this router is 1
  Area 0.0.0.1
       Number of interfaces in this area is 1
       SPF algorithm executed 1 times
       Number of LSA 2. These LSAs' checksum Sum 0x20C8
       Number of Unknown LSA 0
```

Table 298 Description on the fields of the display isofv3 command

Field	Description
Routing Process "OSPFv3 (1)" with ID 1.1.1.1	OSPFv3 process is 1, and router ID is 1.1.1.1.
SPF schedule delay	Delay interval of SPF calculation
Hold time between SPFs	Hold time between SPF calculations
Minimum LSA interval	Minimum interval for generating LSAs
Minimum LSA arrival	Minimum LSA repeat arrival interval
Number of external LSA	Number of ASEs
These external LSAs' checksum Sum	Sum of all the ASEs' checksum
Number of AS-Scoped Unknown LSA	Number of LSAs with unknown flooding scope
Number of LSA originated	Number of LSAs originated
Number of LSA received	Number of LSAs received
Number of areas in this router	Number of areas this router attached to
Area	Area ID
Number of interfaces in this area	Number of interfaces attached to this area
SPF algorithm executed 1 times	SPF algorithm is executed 1 time
Number of LSA	Number of LSAs

Table 298 Description on the fields of the display isofv3 command

Field	Description
These LSAs' checksum Sum	Sum of all LSAs' checksum
Number of Unknown LSA	Number of unknown LSAs

display ospfv3 interface

Syntax **display ospfv3 interface** [*interface-type interface-number* | **statistic**]

View Any view

Parameters *interface-type interface-number*: Interface type and interface number.

statistic: Displays the interface statistics.

Description Use the **display ospfv3 interface** command to display OSPFv3 interface information.

Examples # Display OSPFv3 interface information.

```
<Sysname> display ospfv3 interface serial 2/0
Serial2/0 is up, line protocol is up
  Interface ID 518
  IPv6 Prefixes
    FE80::1441:0:E213:1 (Link-Local Address)
    2000:1::1
  OSPFv3 Process (1), Area 0.0.0.1, Instance ID 0
    Router ID 2.2.2.2, Network Type POINTOPOINT, Cost: 1562
    Transmit Delay is 1 sec, State Point-To-Point, Priority 1
    No designated router on this link
     No backup designated router on this link
    Timer interval configured, Hello: 10, Dead: 40, Wait: 40, Retransmit: 5
       Hello due in 00:00:02
   Neighbor Count is 1, Adjacent neighbor count is 1
```

Table 299 Description on the fields of the display ospfv3 interface command

Field	Description
Interface ID	Interface ID
IPv6 Prefixes	IPv6 Prefix
OSPFv3 Process	OSPFv3 Process
Area	Area ID
Instance ID	Instance ID
Router ID	Router ID
Network Type	Network type of the interface
Cost	Cost value of the interface
Transmit Delay	Transmission delay of the interface
State	Interface state
Priority	DR priority of the interface
No designated router on this link	No designated router on this link
No backup designated router on this link	No backup designated router on this link

Table 299 Description on the fields of the display ospfv3 interface command

Field	Description
Timer interval configured, Hello: 10, Dead: 40, Wait: 40, Retransmit: 5	Time intervals in seconds configured on the interface, Hello: 10, Dead: 40, Wait: 40, Retransmit: 5
Hello due in 00:00:02	Hello packet will be sent in 2 seconds
Neighbor Count	Number of Neighbors on the interface
Adjacent neighbor count	Number of Adjacencies on the interface

display ospfv3 lsdb

Syntax **display ospfv3** [*process-id*] **lsdb** [[**external** | **inter-prefix** | **inter-router** | **intra-prefix** | **link** | **network** | **router**] [*link-state-id*] [**originate-router** *router-id*] | **total**]

View Any view

Parameters *process-id*: Specifies ID of an OSPFv3 process, ranging from 1 to 65535.

external: Specifies to display information about AS-external LSAs.

inter-prefix: Specifies to display information about Inter-area-prefix LSAs.

inter-router: Specifies to display information about Inter-area-router LSAs.

intra-prefix: Specifies to display information about Intra-area-prefix LSAs.

link: Specifies to display information about Link-LSAs.

network: Specifies to display information about Network-LSAs.

router: Specifies to display information about Router-LSAs.

link-state-id: Link state ID, an IPv4 address.

originate-router *router-id*: The ID of the advertising router.

total: Specifies to display all information in the LSDB.

Description Use the **display ospfv3 lsdb** command to display OSPFv3 LSDB information.

Examples # Display OSPFv3 LSDB information.

```
<Sysname> display ospfv3 lsdb

            OSPFv3 Router with ID (5.5.5.5) (Process 1)
               Link-LSA (Interface Ethernet1/0)

display ospfv3 lsdb statistic

Syntax **display ospfv3 lsdb statistic**

View Any view

Parameters None

Description Use the **display ospfv3 lsdb statistic** command to display LSA statistics in the OSPFv3 LSDB.

Examples # Display OSPFv3 LSDB statistics.

```
<System> display ospfv3 lsdb statistic

            OSPFv3 Router with ID (1.1.1.1) (Process 1)
                        LSA Statistics
 ----------------------------------------------------------------------
Area ID         Router   Network  InterPre InterRou IntraPre Link     ASE

Area ID	Area ID
Router	Router-LSA number
Network	Network-LSA number
InterPre	Inter-Area-Prefix-LSA number
InterRou	Inter-Area-Router-LSA number
IntraPre	Intra-Area-Prefix-LSA number
Link	Link-LSA number
ASE	AS-external-LSA number
Total	Total LSA number

display ospfv3 next-hop

Syntax **display ospfv3** [*process-id*] **next-hop**

View Any view

Parameters *process-id*: Specifies ID of an OSPFv3 process, ranging from 1 to 65535.

Description Use the **display ospfv3 next-hop** command to display OSPFv3 next hop information.

If no process is specified, next hop information of all OSPFv3 processes is displayed.

Examples # Display OSPFv3 next hop information.

```
<Sysname> display ospfv3 next-hop

            OSPFv3 Router with ID (2.2.2.2) (Process 1)
Neighbor-Id     Next-Hop                              Interface   RefCount
1.1.1.1         FE80::20F:E2FF:FE00:1                 Eth1/0      1
```

Neighbor-Id	Neighboring router ID
Next-hop	Next-hop address
Interface	Outbound interface
RefCount	Reference count

display ospfv3 peer

Syntax **display ospfv3** [*process-id*] [**area** *area-id*] **peer** [[*interface-type interface-number*] [**verbose**] | *peer-router-id*]

View Any view

Parameters *process-id*: Specifies the ID of an OSPFv3 process, ranging from 1 to 65535.

area: Specifies to display neighbor information of the specified area.

area-id: The ID of an area, a decimal integer that is translated into IPv4 address format by the system (in the range of 0 to 4294967295) or an IPv4 address.

interface-type interface-number: interface type and number.

verbose: Display detailed neighbor information.

peer-router-id: Router-ID of the specified neighbor.

Description Use the **display ospfv3 peer** command to display OSPFv3 neighbor information.

- If no *area-id* is specified, the neighbor information of all areas is displayed.
- If no *process-id* is specified, the information of all processes is displayed.
- If no interface or neighbor Router-ID is specified, the neighbor information of all interfaces is displayed.

Examples # Display the neighbor information of OSPFv3 process 1 on an interface.

```
<Sysname> display ospfv3 1 peer serial 2/0
                    OSPFv3 Process (1)
OSPFv3 Area (0.0.0.1)
Neighbor ID     Pri   State            Dead Time   Interface  Instance ID
1.1.1.1         1     Full/ -          00:00:33    S2/0       0
```

Table 304 Description on the fields of the display isofv3 peer command

Field	Description
Neighbor ID	Neighbor ID
Pri	Priority of neighbor router
State	Neighbor state
Dead Time	Dead time remained
Interface	Interface connected to the neighbor
Instance ID	Instance ID

Display detailed neighbor information of OSPFv3 process 100 of an interface.

```
<Sysname> display ospfv3 100 peer serial 2/0 verbose
OSPFv3 Process (100)
 Neighbor: 1.1.1.1, interface address: FE80::3D43:0:8C14:1
    In the area 0.0.0.1 via interface Serial2/0
    DR is 0.0.0.0 BDR is 0.0.0.0
    Options is 0x000013 (-|R|-|-|E|V6)
    Dead timer due in 00:00:29
    Neighbor is up for 00:06:28
    Database Summary List 0
    Link State Request List 0
    Link State Retransmission List 0
```

Table 305 Description on the fields of the display isofv3 peer verbose command

Field	Description
Neighbor	Neighbor ID
interface address	Interface address
In the area 0.0.0.1 via interface Serial2/0	Interface Serial 2/0 belongs to area 1
DR is 0.0.0.0 BDR is 0.0.0.0	No DR or BDR is selected
Options is 0x000013 (-|R|-|-|E|V6)	The option is 0x000013 (-|R|-|-|E|V6)
Dead timer due in 00:00:29	Dead timer due in 00:00:29
Neighbor is up for 00:06:28	Neighbor is up for 00:06:28
Database Summary List	Number of LSAs sent in DD packet
Link State Request List	Number of LSAs in the link state request list
Link State Retransmission List	Number of LSAs in the link state retransmission list

display ospfv3 peer statistic

Syntax **display ospfv3 peer statistic**

View Any view

Parameters None

Description Use the **display ospfv3 peer statistic** command to display information about all OSPFv3 neighbors on the router, that is, numbers of neighbors in different states.

Examples # Display information about all OSPFv3 neighbors.

```
<Sysname> display ospfv3 peer statistic

            OSPFv3 Router with ID (1.1.1.1) (Process 1)
                          Neighbor Statistics
 ------------------------------------------------------------------------
Area ID          Down     Init     2-way    ExStar   Exchange Loading  Full
0.0.0.0          0        0        0        0        0        0        1
Total            0        0        0        0        0        0        1
```

Table 306 Description on the fields of the display ospfv3 peer statistic command

Field	Description
Area ID	Area ID
Down	In this state, neighbor initial state, the router has not received any information from a neighboring router for a period of time.
Init	In this state, the router received a Hello packet from the neighbor but the packet gives no ID of the router. Mutual communication is not available.
2-Way	Indicates mutual communication between the router and its neighbor is available. DR/BDR election is finished under this state (or higher).
ExStart	In this state, the router decides on the initial DD sequence number and master/slave relationship of the two parties.
Exchange	In this state, the router exchanges DD packets with the neighbor.
Loading	In this state, the router send LSRs to request the neighbor for needed LSAs.
Full	Indicates LSDB synchronization has been accomplished between neighbors.
Total	Total number of neighbors under the same state

display ospfv3 request-list

Syntax **display ospfv3** [*process-id*] **request-list** [**statistics**]

View Any view

Parameters *process-id*: OSPFv3 process ID, in the range 1 to 65535.

statistics: Statistics of link state request list.

Description Use the **display ospfv3 request-list** command to display OSPFv3 link state request list.

If no process is specified, link state request list information of all OSPFv3 processes is displayed.

Examples # Display the information of OSPFv3 link state request list.

```
<Sysname> display ospfv3 request-list

            OSPFv3 Router with ID (1.1.1.1) (Process 1)
             Interface  Eth1/0    Area-ID   0.0.0.1
 ------------------------------------------------------------------------
                         Nbr-ID   2.2.2.2
LS-Type              LS-ID           AdvRouter       SeqNum       Age
AS-External-LSA      0.0.16.66       2.2.2.2         0x80000001   98
AS-External-LSA      0.0.16.67       2.2.2.2         0x80000001   98
AS-External-LSA      0.0.16.68       2.2.2.2         0x80000001   98
```

Table 307 Description on the fields of the display ospfv3 request-list command

Field	Description
Interface	Interface name
Area-ID	Area ID
Nbr-ID	Neighbor router ID
LS-Type	Type of LSA
LS-ID	Link state ID
AdvRouter	Advertising router
SeqNum	LSA sequence number
Age	Age of LSA

Display the statistics of OSPFv3 link state request list.

```
<Sysname> display ospfv3 request-list statistics

            OSPFv3 Router with ID (1.1.1.1) (Process 1)
Interface   Neighbor        LSA-Count
Eth1/0          2.2.2.2          0
```

Table 308 Description on the fields of the display ospfv3 request-list statistics command

Field	Description
Interface	Interface name
Neighbor	Neighbor router ID
LSA-Count	Number of LSAs in the request list

display ospfv3 retrans-list

Syntax **display ospfv3** [*process-id*] **retrans-list** [**statistics**]

View Any view

Parameters *process-id*: OSPFv3 process ID, in the range 1 to 65535.

statistics: Displays link state retransmission list statistics.

Description Use the **display ospfv3 retrans-list** command to display OSPFv3 link state retransmission list.

If no process is specified, link state retransmission list information of all OSPFv3 processes is displayed.

Examples # Display the information of OSPFv3 link state retransmission list.

```
<Sysname> display ospfv3 retrans-list
            OSPFv3 Router with ID (2.2.2.2) (Process 1)
             Interface  Eth1/0    Area-ID   0.0.0.1
 ----------------------------------------------------------------------
                          Nbr-ID   2.2.2.2
LS-Type                LS-ID           AdvRouter       SeqNum       Age
Router-LSA             0.0.0.0         2.2.2.2         0x80000006   0
Network-LSA            0.15.0.8        2.2.2.2         0x80000001   0
Intra-Area-Prefix-LSA  0.0.0.1         2.2.2.2         0x80000006   0
```

Table 309 Description on the fields of the display ospfv3 retrans-list command

Field	Description
Interface	Interface name
Area-ID	Area ID
Nbr-ID	Neighbor router ID
LS-Type	Type of LSA
LS-ID	Link state ID
AdvRouter	Advertising Router
SeqNum	LSA sequence Number
Age	Age of LSA

Display the statistics of OSPFv3 link state retransmission list.

```
<Sysname>display ospfv3 retrans-list statistics

            OSPFv3 Router with ID (3.3.3.3) (Process 1)
Interface  Neighbor        LSA-Count
Eth1/0     1.1.1.1           0
```

Table 310 Description on the fields of the display ospfv3 retrans-list statistics command

Field	Description
Interface	Interface name
Neighbor	Neighbor ID
LSA-Count	Number of LSAs in the retransmission request list

display ospfv3 routing

Syntax **display ospfv3** [*process-id*] **routing** [*ipv6-address prefix-length* | *ipv6-prefix /prefix-length* | **abr-routes** | **asbr-routes** | **all** | **statistics**]

View Any view

Parameters *process-id*: Specifies the ID of an OSPFv3 process, ranging from 1 to 65535.

ipv6-address: IPv6 address prefix.

prefix-length: Prefix length, in the range 0 to 128.

abr-routes: Specifies to display routes to ABR.

asbr-routes: Specifies to display routes to ASBR.

all: Specifies to display all routes.

statistics: Specifies to display the statistics of OSPFv3 routing table.

Description Use the **display ospfv3 routing** command to display OSPFv3 routing table information.

If no process is specified, routing table information of all OSPFv3 processes is displayed.

Examples # Display OSPFv3 routing table information.

```
<Sysname> display ospfv3 routing

 E1 - Type 1 external route,    IA - Inter area route,    I  - Intra area route
 E2 - Type 2 external route,    *  - Selected route

            OSPFv3 Router with ID (1.1.1.1) (Process 1)
 ------------------------------------------------------------------------
 *Destination: 2001::/64
  Type       : I                                      Cost     : 1
  NextHop    : directly-connected                     Interface: Eth1/0
```

Table 311 Description on the fields of the display ospfv3 routing command

Field	Description
Destination	Destination network segment
Type	Route type
Cost	Route cost value
Next-hop	Next hop address
Interface	Outbound interface

Display the statistics of OSPFv3 routing table.

```
<Sysname> display ospfv3 routing statistics
            OSPFv3 Router with ID (1.1.1.1) (Process 1)
                          OSPFv3 Routing Statistics
 Intra-area-routes   :   1
 Inter-area-routes   :   0
 External-routes     :   0
```

Table 312 Description on the fields of the display ospfv3 routing statistics command

Field	Description
Intra-area-routes	Number of Intra-area-routes
Inter-area-routes	Number of inter-area routes
External-routes	Number of external routes

display ospfv3 statistic

Syntax **display ospfv3 statistic**

View Any view

Parameters None

Description Use the **display ospfv3 statistic** command to display outbound/inbound OSPFv3 packet statistics on associated interface(s).

Examples # Display outbound/inbound OSPFv3 packet statistics on associated interfaces.

```
<Sysname> display ospfv3 statistic

                        OSPFv3 Statistics
Interface Ethernet1/0 Instance 0
 Type               Input       Output
 Hello              189         63
 DB Description     10          8
 Ls Req             2           1
 Ls Upd             16          6
 Ls Ack             10          6
```

Table 313 Description on the fields of the display ospfv3 statistics command

Field	Description
Interface	Interface name
Instance	Instance number
Type	Type of packet
Input	Number of packets received by the interface
Output	Number of packets sent by the interface
Hello	Hello packet
DB Description	Database description packet
Ls Req	Link state request packet
Ls Upd	Link state update packet
Ls Ack	Link state acknowledgement packet

display ospfv3 topology

Syntax **display ospfv3** [*process-id*] **topology** [**area** *area-id*]

View Any view

Parameters *process-id*: Specifies the ID of an OSPFv3 process of which to display topology information, ranging from 1 to 65535.

area: Display the topology information of the specified area.

area-id: The ID of an area, a decimal integer (in the range of 0 to 4294967295) that is translated into IPv4 address format by the system or an IPv4 address.

Description Use the **display ospfv3 topology** command to display OSPFv3 topology information. If no process is specified, topology information of all OSPFv3 processes is displayed.

Examples # Display OSPFv3 area 1 topology information.

```
<Sysname> display ospfv3 topology area 1

                      OSPFv3 Process (1)
OSPFv3 Area (0.0.0.1) topology
Type  ID(If-Index)       Bits      Metric    Next-Hop        Interface
Rtr   1.1.1.1                      --
Rtr   2.2.2.2                      1         2.2.2.2         Eth1/0
Rtr   3.3.3.3                      1         3.3.3.3         Eth1/0
Rtr   4.4.4.4                      1         4.4.4.4         Eth1/0
Net   4.4.4.4(983049)              1         0.0.0.0         Eth1/0
```

Table 314 Description on the fields of the display ospfv3 topology command

Field	Description
Type	Type of node
ID(If-Index)	Router ID
Bits	Flag bit
Metric	Cost value
Next-Hop	Next hop
Interface	Outbound interface

display ospfv3 vlink

Syntax **display ospfv3** [*process-id*] **vlink**

View Any view

Parameters *process-id*: Specifies the ID of an OSPFv3 process, ranging from 1 to 65535.

Description Use the **display ospfv3 vlink** command to display OSPFv3 virtual link information. If no process is specified, virtual link information of all OSPFv3 processes is displayed.

Examples # Display OSPFv3 virtual link information.

```
<Sysname> display ospfv3 vlink
     Virtual Link VLINK1 to router 1.1.1.1 is up
       Transit area :0.0.0.1 via interface Serial2/0, instance ID: 0
       Local address: 2000:1::1
       Remote address: 2001:1:1::1
       Transmit Delay is 1 sec, State: P-To-P,
       Timer intervals configured, Hello: 10, Dead: 40, Wait: 40, Re
transmit: 5
```

```
Hello due in 00:00:02
Adjacency state :Full
```

Table 315 Description on the fields of the display ospfv3 vlink command

Field	Description
Virtual Link VLINK1 to router 1.1.1.1 is up	The virtual link VLINK1 to router 1.1.1.1 is up
Transit area 0.0.0.1 via interface Serial2/0	Interface Serial 2/0 in transit area 0.0.0.1.
instance ID	Instance ID
Local address	Local IPv6 address
Remote address	Remote IPv6 address
Transmit Delay	Transmit delay of sending LSAs
State	Interface state
Timer intervals configured, Hello: 10, Dead: 40, Wait: 40, Retransmit: 5	Timer intervals in seconds, Hello: 10, Dead: 40, Wait: 40, Retransmit: 5
Hello due in 00:00:02	Send hello packets in 2 seconds.
Adjacency state	Adjacency state

filter-policy export(OSPFv3 view)

Syntax **filter-policy** { *acl-number* | **ipv6-prefix** *ipv6-prefix-name* } **export** [**isisv6** *process-id* | **ospfv3** *process-id* | **ripng** *process-id* | **bgp4+** | **direct** | **static**]

undo filter-policy export [**isisv6** *process-id* | **ospfv3** *process-id* | **ripng** *process-id* | **bgp4+** | **direct** | **static**]

View OSPFv3 view

Parameters *acl-number*: Specifies the ACL number, ranging from 2000 to 3999.

ipv6-prefix *ipv6-prefix-name*: Specifies the name of an IPv6 prefix list, a string of up to 19 characters.

isisv6 *process-id*: Specifies to filter the routes of an IPv6 IS-IS process, which is in the range of 1 to 65535.

ospfv3 *process-id*: Specifies to filter the routes of an OSPFv3 process, which is in the range of 1 to 65535.

ripng *process-id*: Specifies to filter the routes of a RIPng process, which in the range of 1 to 65535.

bgp4+: Specifies to filter BGP4+ routes.

direct: Specifies to filter direct routes.

static: Specifies to filter static routes.

Description Use the **filter-policy export** command to filter redistributed routes.

Use the **undo filter-policy export** command to remove the configuration.

If no protocol is specified, all redistributed routes will be filtered.

By default, IPv6 OSPFv3 does not filter redistributed routes.

*Using the **filter-policy export** command filters only routes redistributed by the **import-route** command. If the **import-route** command is not configured to redistribute routes from other protocols and other OSPFv3 processes, use of the **filter-policy export** command does not take effect.*

Examples # Filter all redistributed routes using IPv6 ACL 2001.

```
<Sysname> system-view
[Sysname] acl ipv6 number 2001
[Sysname-acl6-basic-2000] rule permit source 2002:1:: 64
[Sysname-acl6-basic-2000] quit
[Sysname] ospfv3
[Sysname-ospfv3-1] filter-policy 2001 export
```

filter-policy import(OSPFv3 view)

Syntax **filter-policy** { *acl6-number* | **ipv6-prefix** *ipv6-prefix-name* } **import**

undo filter-policy import

View OSPFv3 view

Parameters *acl6-number*: Specifies an ACL number, ranging from 2000 to 3999.

ipv6-prefix *ipv6-prefix-name*: Specifies the name of an IPv6 prefix list, a string of up to 19 characters.

Description Use the **filter-policy import** command to filter received routes.

Use the **undo filter-policy import** command to remove the configuration.

No received routes are filtered by default.

*Using the **filter-policy import** command only filters routes computed by OSPFv3. The routes that fail to pass are not added to the routing table.*

Examples # Filter received routes using the IPv6 prefix list **abc**.

```
<Sysname> system-view
[Sysname] ip ipv6-prefix abc permit 2002:1:: 64
[Sysname] ospfv3 1
[Sysname-ospfv3-1] filter-policy ipv6-prefix abc import
```

import-route(OSPFv3 view)

Syntax **import-route** { **isisv6** *process-id* | **ospfv3** *process-id* | **ripng** *process-id* | **bgp4+** [**allow-ibgp**] | **direct** | **static** } [**cost** *value* | **type** *type* | **route-policy** *route-policy-name*]*

undo import-route { **isis** *process-id* | **ospfv3** *process-id* | **ripng** *process-id* | **bgp4+** | **direct** | **static** }

View OSPFv3 view

Parameters **isisv6** *process-id*: Specifies a process ID of ISIS to redistribute ISIS routes with the process ID, in the range 1 to 65535.

ospfv3 *process-id*: Specifies a process ID of OSPFv3 to redistribute OSPFv3 routes with the process ID, in the range 1 to 65535.

ripng *process-id*: Specifies a process ID of **ripng** to redistribute **ripng** routes with the process ID, in the range 1 to 65535.

bgp4+: Specifies to redistribute **bgp4+** routes.

allow-ibgp: Allows redistributing IBGP route.

direct: Specifies to redistribute **direct** routes.

static: Specifies to redistributes **static** routes.

cost *value*: Specifies the cost for redistributed routes, ranging from 1 to 16777214. It defaults to 1.

type *type*: Specifies the type for redistributed routes, 1 or 2. It defaults to 2.

route-policy *route-policy-name*: Specifies to redistribute only the routes that match the specified route-policy. *route-policy-name* is a string of up to 19 characters.

CAUTION: *Using the* ***import-route bgp4+*** *command redistributes only EBGP routes, while using the* ***import-route bgp4+ allow-ibgp*** *command redistributes both EBGP and IBGP routes.*

Description Use the **import-route** command to redistribute routes.

Use the **undo import-route** command to disable routes redistribution.

IPv6 OSPFv3 does not redistribute routes from other protocols by default.

Examples # Configure to redistribute routes from RIPng and specify the type as type 2 and cost as 50.

```
<Sysname> system-view
[Sysname] ospfv3
[Sysname-ospfv3-1] import-route ripng 10 type 2 cost 50
```

Configure OSPFv3 process 100 to redistribute the routes found by OSPFv3 process 160.

```
<Sysname> system-view
[Sysname] ospfv3 100
[Sysname-ospfv3-100] import-route ospfv3 160
```

log-peer-change

Syntax **log-peer-change**

undo log-peer-change

View OSPFv3 view

Parameters None

Description Use the **log-peer-change** command to enable the logging on neighbor state changes.

Use the **undo maximum load-balancing** command to disable the logging.

With this feature enabled, information about neighbor state changes of the current OSPFv3 process will display on the configuration terminal.

Examples # Disable the logging on neighbor state changes of OSPFv3 process 100.

```
<Sysname> system-view
[Sysname] ospfv3 100
[Sysname-ospfv3-100] undo log-peer-change
```

maximum load-balancing(OSPFv3 view)

Syntax **maximum load-balancing** *maximum*

undo maximum load-balancing

View OSPFv3 view

Parameters *maximum*: Maximum number of load-balanced routes, in the range 1 to 8. The argument being set to 1 means no load balancing is available.

Description Use the **maximum load-balancing** command to configure the maximum number of load-balanced routes.

Use the **undo maximum load-balancing** command to restore the default.

Examples # Configure the maximum load-balanced routes as 6.

```
<Sysname> system-view
[Sysname] ospfv3 1
[Sysname-ospfv3-1] maximum load-balancing 6
```

ospfv3

Syntax **ospfv3** [*process-id*]

undo ospfv3 [*process-id*]

View System view

Parameters *process-id*: Specifies the ID of an OSPFv3 process, ranging from 1 to 65535. The process ID defaults to 1.

Description Use the **ospfv3** command to enable an OSPFv3 process and enter OSPFv3 view.

Use the **undo ospfv3** command to disable an OSPFv3 process.

The system runs no OSPFv3 process by default.

Related commands: **router-id**.

An OSPFv3 process can run normally only when Router ID is configured in OSPFv3 view. Otherwise, you can find the process, but which cannot generate any LSA.

Examples # Enable the OSPFv3 process with process ID as 120 and configure the Router ID as 1.1.1.1.

```
<Sysname> system-view
[Sysname] ospfv3 120
[Sysname-ospfv3-120] router-id 1.1.1.1
```

ospfv3 area

Syntax **ospfv3** *process-id* **area** *area-id* [**instance** *instance-id*]

undo ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]

View Interface view

Parameters *process-id*: Specifies the ID of an OSPFv3 process, ranging from 1 to 65535.

area-id: The ID of an area, a decimal integer (in the range of 0 to 4294967295) that is translated into IPv4 address format by the system or an IPv4 address.

instance-id: The instance ID of an interface, in the range of 0 to 255, which defaults to 0.

Description Use the **ospfv3 area** command to enable an OSPFv3 process on the interface and specify the area for the process.

Use the **undo ospfv3 area** command to disable an OSPFv3 process.

OSPFv3 is not enabled on an interface by default.

Examples # Enable OSPFv3 process 1 on an interface that belongs to instance 1 and specify area 1 for the process.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-serial2/0] ospfv3 1 area 1 instance 1
```

ospfv3 cost

Syntax **ospfv3 cost** *value* [**instance** *instance-id*]

undo ospfv3 cost [**instance** *instance-id*]

View Interface view

Parameters *value*: OSPFv3 cost of the interface, in the range 1 to 65535.

instance-id: The instance ID of an interface, in the range of 0 to 255, which defaults to 0.

Description Use the **ospfv3 cost** command to configure the OSPFv3 cost on an interface of an instance.

Use the **undo ospfv3 cost** command to restore the default OSPFv3 cost on an interface of an instance.

By default, a router's interface automatically calculates the OSPFv3 cost based on its bandwidth.

Examples # Specifies the OSPFv3 cost as 33 on an interface of instance 1.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ospfv3 cost 33 instance 1
```

ospfv3 dr-priority

Syntax **ospfv3 dr-priority** *priority* [**instance** *instance-id*]

undo ospfv3 dr-priority [**instance** *instance-id*]

View Interface view

Parameters *priority*: DR priority, in the range 0 to 255.

instance-id: ID of the instance an interface belongs to, in the range 0 to 255, which defaults to 0.

Description Use the **ospfv3 dr-priority** command to set the DR priority for an interface of an instance.

Use the **undo ospfv3 dr-priority** command to restore the default value.

The DR priority on an interface defaults to 1

An interface's DR priority determines its privilege for DR/BDR selection, and the interface with the highest priority is considered first.

Examples # Set the DR priority for an interface of instance 1 to 8.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ospfv3 dr-priority 8 instance 1
```

ospfv3 mtu-ignore

Syntax **ospfv3 mtu-ignore** [**instance** *instance-id*]

undo ospfv3 mtu-ignore [**instance** *instance-id*]

View Interface view

Parameters *instance-id*: Instance ID, in the range 0 to 255, which defaults to 0.

Description Use the **ospfv3 mtu-ignore** command to configure an interface to ignore MTU when sending DD packets.

Use the **undo ospfv3 mtu-ignore** command to restore the default configuration.

MTU is not ignored by default.

Examples # Configure an interface that belongs to instance 1 to ignore MTU.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ospfv3 mtu-ignore instance 1
```

ospfv3 timer dead

Syntax **ospfv3 timer dead** *seconds* [**instance** *instance-id*]

undo ospfv3 timer dead [**instance** *instance-id*]

View Interface view

Parameters *seconds*: Dead time in seconds, ranging from 1 to 65535,

instance-id: The instance ID of an interface, in the range of 0 to 255, which defaults to 0.

Description Use the **ospfv3 timer dead** command to configure the OSPFv3 neighbor dead time for an interface that belongs to a specified instance.

Use the **undo ospfv3 timer dead** command to restore the default.

By default, the OSPFv3 neighbor dead time is 40 seconds for P2P and Broadcast interfaces, and is not supported on P2MP and NBMA interfaces at present.

OSPFv3 neighbor dead time: if an interface receives no hello packet from a neighbor after dead time elapses, the interface will considers the neighbor is dead.

The **dead** *seconds* value is at least four times the **Hello** *seconds* value and must be identical on interfaces attached to the same network segment.

Related commands: **ospfv3 timer hello**.

Examples # Configure the OSPFv3 neighbor dead time as 80 seconds for an interface with instance 1.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ospfv3 timer dead 80 instance 1
```

ospfv3 timer hello

Syntax **ospfv3 timer hello** *seconds* [**instance** *instance-id*]

undo ospfv3 timer hello [**instance** *instance-id*]

View Interface view

Parameters *seconds*: Interval between hello packets, ranging from 1 to 65535.

instance-id: The instance ID of an interface, in the range of 0 to 255, which defaults to 0.

Description Use the **ospfv3 timer hello** command to configure the hello interval for an interface that belongs to an instance.

Use the **undo ospfv3 timer hello** command to restore the default.

By default, the hello interval is 10 seconds for P2P and Broadcast interfaces, and is not supported on the P2MP or NBMA interfaces at present.

Related commands: **ospfv3 timer dead**.

Examples # Configure the hello interval as 20 seconds for an interface of instance 1.

```
<Sysname> system-view
[Sysname] interface serial 2/0
[Sysname-Serial2/0] ospfv3 timer hello 20 instance 1
```

ospfv3 timer retransmit

Syntax **ospfv3 timer retransmit** *interval* [**instance** *instance-id*]

undo ospfv3 timer retransmit [**instance** *instance-id*]

View Interface view

Parameters *interval*: Specifies LSA retransmission interval in seconds for an interface, ranging from 1 to 65535.

instance-id: The instance ID of an interface, in the range of 0 to 255, which defaults to 0.

Description Use the **ospfv3 timer retransmit** command to configure the LSA retransmission interval for an interface of an instance.

Use the **undo ospfv3 timer retransmit** command to restore the default.

The interval defaults to 5 seconds.

When a router sends a LSA to its neighbor, it waits for an acknowledgement. If receiving no acknowledgement after retransmission interval elapses, it will retransmit the LSA.

The LSA retransmission interval should not be too small for avoidance of unnecessary retransmissions.

Examples # Configure the LSA retransmission interval on an interface of instance 1 as 12 seconds.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ospfv3 timer retransmit 12 instance 1
```

ospfv3 trans-delay

Syntax **ospfv3 trans-delay** *seconds* [**instance** *instance-id*]

undo ospfv3 trans-delay [**instance** *instance-id*]

View Interface view

Parameters *seconds*: Transmission delay in seconds, ranging from 1 to 3600. The default is 1.

instance-id: The instance ID of an interface, in the range of 0 to 255, with the default as 0.

Description Use the **ospfv3 trans-delay** command to configure the transmission delay for an interface with an instance ID.

Use the **undo ospfv3 trans-delay** command to restore the default.

The transmission delay defaults to 1s.

As LSAs are aged in the LSDB (incremented 1 by each second) but not aged on transmission, it is necessary to add a delay time to the age time before sending a LSA. This configuration is important for low-speed networks.

Examples # Configure the transmission delay as 3 seconds for an interface of instance 1.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ospfv3 trans-delay 3 instance 1
```

preference

Syntax **preference** [**ase**] [**route-policy** *route-policy-name*] *preference*

undo preference [**ase**]

View OSPFv3 view

Parameters **ase**: Applies the preference to OSPFv3 external routes. If the keyword is not specified, the preference applies to OSPFv3 internal routes.

route-policy *route-policy-name*: References a routing policy to set preference for specific routes. The name is a string of 1 to 19 characters.

preference: Preference of OSPFv3, in the range 1 to 255.

Description Use the **preference** command to specify a preference for OSPFv3 routes.

Use the **undo preference** command to restore the default.

By default, the preference for OSPFv3 internal routes is 10, and that for OSPFv3 external routes is 150.

The smaller the value is, the higher the preference is.

A router may run multiple routing protocols. Each protocol has a preference. When several routing protocols find multiple routes to the same destination, the route found by the protocol with the highest preference is selected.

Examples # Set a preference of 150 for OSPFv3 routes.

```
<Sysname> system-view
[Sysname] OSPFv3
[Sysname-OSPFv3-1] preference 150
```

router-id

Syntax **router-id** *router-id*

undo router-id

View OSPFv3 view

Parameters *router-id*: A 32-bit router ID, in IPv4 address format.

Description Use the **router-id** command to configure the OSPFv3 router ID.

Use the **undo router-id** command to remove a configured router ID.

Router ID is the unique identification of an OSPF process in an autonomous system. An OSPFv3 process cannot run without a Router ID.

Make sure that different processes have different Router IDs.

Related commands: **ospfv3**.

By configuring different router IDs for different processes, you can run multiple OSPFv3 processes on a router.

Examples # Configure the Router ID as 10.1.1.3 for OSPFv3 process 1.

```
<Sysname> system-view
[Sysname] ospfv3 1
[Sysname-ospfv3-1] router-id 10.1.1.3
```

silent-interface(OSPFv3 view)

Syntax **silent-interface** { *interface-type interface-number* | **all** }

undo silent-interface { *interface-type interface-number* | **all** }

View OSPFv3 view

Parameters *interface-type interface-number*: Interface type and number

all: Specifies all interfaces.

Description Use the **silent-interface** command to disable the specified interface from sending OSPFv3 packets.

Use the **undo silent-interface** command to restore the default.

An interface is able to send OSPFv3 packets by default.

Multiple processes can disable the same interface from sending OSPFv3 packets, but use of the **silent-interface** command takes effect only on interfaces enabled with the current process.

Examples # Disable an interface from sending OSPFv3 packets in OSPFv3 processes 100 and 200.

```
<Sysname> system-view
[Sysname] ospfv3 100
[Sysname-ospfv3-100] router-id 10.110.1.9
[Sysname-ospfv3-100] silent-interface ethernet 1/0
[Sysname-ospfv3-100] quit
[Sysname] ospfv3 200
[Sysname-ospfv3-200] router-id 20.18.0.7
[Sysname-ospfv3-200] silent-interface ethernet 1/0
```

spf timers

Syntax **spf timers** *delay-interval hold-interval*

undo spf timers

View OSPFv3 view

Parameters *delay-interval*: The interval in seconds between when OSPFv3 receives a topology change and when it starts SPF calculation. in the range 1 to 65535.

hold-interval: The hold interval in seconds between two SPF calculations, in the range 1 to 65535.

Description Use the **spf timers** command to configure the delay interval and hold interval for OSPFv3 SPF calculation.

Use the **undo spf timers** command to restore the default.

The delay interval and hold interval default to 5s and 10s.

An OSPFv3 router works out a shortest path tree with itself as root based on the LSDB, and decides on the next hop to a destination network according the tree. Adjusting the SPF calculation interval can restrain bandwidth and router resource from over consumption due to frequent network changes.

Examples # Configure the delay interval and hold interval as 6 seconds for SPF calculation.

```
<Sysname> system-view
[Sysname]ospfv3 1
[Sysname-ospfv3-1] spf timers 6 6
```

stub(OSPFv3 area view)

Syntax **stub** [**no-summary**]

undo stub

View OSPFv3 area view

Parameters **no-summary**: This argument is only applicable to the ABR of a stub area. With it configured, the ABR advertises only a default route in a Summary-LSA to the stub area (such an area is called a totally stub area).

Description Use the **stub** command to configure an area as a stub area.

Use the **undo stub** command to remove the configuration.

By default, an area is not configured as a stub area.

When an area is configured as a stub area, all the routers attached to the area must be configured with the **stub** command.

Related commands: **default cost**.

Examples # Configure OSPFv3 area 1 as a stub area.

```
<Sysname> system-view
[Sysname] ospfv3 1
[Sysname-ospfv3-1] area 1
[Sysname-ospfv3-1-area-0.0.0.1] stub
```

vlink-peer(OSPFv3 area view)

Syntax **vlink-peer** *router-id* [**hello** *seconds* | **retransmit** *seconds* | **trans-delay** *seconds* | **dead** *seconds* | **instance** *instance-id*] *

undo vlink-peer *router-id* [**hello** | **retransmit** | **trans-delay** | **dead**]*

View OSPFv3 area view

Parameters *router-id*: Router ID for a virtual link neighbor.

hello *seconds*: Specifies the interval in seconds of sending Hello packets, ranging from 1 to 8192, with the default as 10. This value must equal to the **hello** *seconds* configured on the virtual link peer router.

retransmit *seconds*: Specifies the interval in seconds of retransmitting LSA packets, ranging from 1 to 3600, with the default as 5.

trans-delay *seconds*: Specifies the delay interval in seconds of sending LSA packets, ranging from 1 to 3600, with the default as 1.

dead *seconds*: Specifies the neighbor dead time in seconds, ranging from 1 to 32768, with the default as 40. This value must equal to the **dead** *seconds* configured on the virtual link peer router, and at least four times the value of **hello** *seconds*.

instance *Instance-id*: The instance ID of an virtual link, in the range of 0 to 255, with the default as 0.

Description Use the **vlink-peer** command to create and configure a virtual link.

Use the **undo vlink-peer** command to remove a virtual link.

For a non-backbone area without direct connection with the backbone area or for a backbone area that cannot maintain connectivity, you can use the **vlink-peer** command to create logical connectivity. A virtual link can be considered as an interface with OSPFv3 enabled, because parameters such as **hello**, **dead**, **retransmit** and **trans-delay** are configured in the similar way.

Both ends of a virtual link are ABRs that are configured with the **vlink-peer** command.

Examples # Create a virtual link to 10.110.0.3.

```
<Sysname> system-view
[Sysname] ospfv3 1
[Sysname-ospfv3-1] area 10.0.0.0
[Sysname-ospfv3-1-area-10.0.0.0] vlink-peer 10.110.0.3
```

85 IPv6 RIPng Configuration Commands

checkzero

Syntax **checkzero**

undo checkzero

View RIPng view

Parameters None

Description Use the **checkzero** command to enable the zero field check on RIPng packets.

Use the **undo checkzero** command to disable the zero field check.

The zero field check is enabled by default.

Some fields in RIPng packet headers must be zero. These fields are called zero fields. You can enable the zero field check on RIPng packet headers. If any such field contains a non-zero value, the RIPng packet will be discarded.

Examples # Disable the zero field check on RIPng packet headers of RIPng 100.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100] undo checkzero
```

default cost (RIPng view)

Syntax **default cost** *cost*

undo default cost

View RIPng view

Parameters *cost*: Default metric of redistributed routes, in the range of 0 to 16.

Description Use the **default cost** command to specify the default metric of redistributed routes.

Use the **undo default cost** command to restore the default.

By default, the default metric of redistributed routes is 0.

The specified default metric applies to routes redistributed by the **import-route** command that has no metric specified.

Related commands: **import-route**.

Examples # Set the default metric of redistributed routes to 2.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100] default cost 2
```

display ripng

Syntax **display ripng** [*process-id*]

View Any view

Parameters *process-id*: RIPng process number, in the range of 1 to 65535.

Description Use the **display ripng** command to display the running status and configuration information of a RIPng process. If *process-id* is not specified, information of all RIPng processes will be displayed.

Examples # Display the running status and configuration information of all configured RIPng processes.

```
<Sysname> display ripng
    RIPng process : 1
       Preference : 100
       Checkzero : Enabled
       Default Cost : 0
       Maximum number of balanced paths : 3
       Update time  :   30 sec(s)  Timeout time           :  180 sec(s)
       Suppress time    :  120 sec(s)  Garbage-Collect time :  120 sec(s)
       Number of periodic updates sent : 0
       Number of trigger updates sent : 0
```

Table 316 Description on the fields of the display ripng command

Field	Description
RIPng Process	RIPng process number
Preference	RIPng route priority
Checkzero	Whether zero field check for RIPng packet headers is enabled
Default Cost	Default metric of redistributed routes
Maximum number of balanced paths	Maximum number of load balanced routes
Update time	RIPng updating interval, in seconds
Timeout time	RIPng timeout interval, in seconds
Suppress time	RIPng suppress interval, in seconds
Garbage-Collect time	RIPng garbage collection interval, in seconds

Table 316 Description on the fields of the display ripng command

Field	Description
Number of periodic updates sent	Number of periodic updates sent
Number of trigger updates sent	Number of triggered updates sent

display ripng database

Syntax **display ripng** *process-id* **database**

View Any view

Parameters *process-id*: RIPng process number, in the range of 1 to 65535.

Description Use the **display ripng database** command to display all active routes in the RIPng advertising database, which are sent in normal RIPng update messages.

Examples # Display the active routes in the database of RIPng process 100.

```
<Sysname> display ripng 100 database
   2001:7B::2:2A1:5DE/64,
        cost 4, Imported
   1:13::/120,
        cost 4, Imported
   1:32::/120,
        cost 4, Imported
   1:33::/120,
        cost 4, Imported
   100::/32,
       via FE80::200:5EFF:FE04:3302, cost 2
   3FFE:C00:C18:1::/64,
       via FE80::200:5EFF:FE04:B602, cost 2
   3FFE:C00:C18:1::/64,
       via FE80::200:5EFF:FE04:B601, cost 2
   3FFE:C00:C18:2::/64,
       via FE80::200:5EFF:FE04:B602, cost 2
   3FFE:C00:C18:3::/64,
       via FE80::200:5EFF:FE04:B601, cost 2
   4000:1::/64,
       via FE80::200:5EFF:FE04:3302, cost 2
   4000:2::/64,
       via FE80::200:5EFF:FE04:3302, cost 2
```

Table 317 Description on fields of the display ripng database command

Field	Description
2001:7B::2:2A1:5DE/64	IPv6 destination address/prefix length
via	Next hop IPv6 address
cost	Route metric value
Imported	Routes learnt from other routing protocols

display ripng interface

Syntax **display ripng** *process-id* **interface** [*interface-type interface-number*]

View Any view

Parameters *process-id*: RIPng process number, in the range of 1 to 65535.

interface-type interface-number: Specified an interface.

Description Use the **display ripng interface** command to display the interface information of the RIPng process.

If no interface is specified, information about all interfaces of the RIPng process will be displayed.

Examples # Display the interface information of RIPng process 1.

```
<Sysname> display ripng 1 interface
Interface-name: Ethernet1/0
          Link Local Address: FE80::20F:E2FF:FE30:C16C
          Split-horizon: on             Poison-reverse: off
          MetricIn: 0                      MetricOut: 1
          Default route: off
          Summary address:
                 3:: 64
                 3:: 16
```

Table 318 Description on the fields of the display ripng interface command

Field	Description
Interface-name	Name of an interface running RIPng.
Link Local Address	Link-local address of an interface running RIPng
Split-horizon	Indicates whether the split horizon function is enabled (on: Enabled off: Disabled).
Poison-reverse	Indicates whether the poison reverse function is enabled (on: Enabled off: Disabled).
MetricIn/MetricOut	Additional metric to incoming and outgoing routes
Default route	■ Only/Originate: Only means that the interface advertises only default route. Originate means that the default route and other RIPng routes are advertised. ■ Off, indicates that no default route is advertised or the garbage-collect time expires after the default route advertisement was disabled. ■ In garbage-collect status: With default route advertisement disabled, the interface advertises the default route with metric 16 during the garbage-collect time.
Summary address	The summarized IPv6 prefix and the summary IPv6 prefix on the interface

display ripng route

Syntax **display ripng** *process-id* **route**

View Any view

Parameters *process-id*: RIPng process number, in the range of 1 to 65535.

Description Use the **display ripng route** command to display all RIPng routes and timers associated to each route of a RIPng process.

Examples # Display the routing information of RIPng process 100.

```
<Sysname> display ripng 100 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect
 ----------------------------------------------------------------
 Peer FE80::200:5EFF:FE04:B602  on Ethernet1/0
 Dest 3FFE:C00:C18:1::/64,
     via FE80::200:5EFF:FE04:B602, cost  2, tag 0, A, 34 Sec
 Dest 3FFE:C00:C18:2::/64,
     via FE80::200:5EFF:FE04:B602, cost  2, tag 0, A, 34 Sec

 Peer FE80::200:5EFF:FE04:B601 on Ethernet1/1
 Dest 3FFE:C00:C18:1::/64,
     via FE80::200:5EFF:FE04:B601, cost  2, tag 0, A, 13 Sec
 Dest 3FFE:C00:C18:3::/64,
     via FE80::200:5EFF:FE04:B601, cost  2, tag 0, A, 13 Sec

 Peer FE80::200:5EFF:FE04:3302  on Ethernet1/2
 Dest 100::/32,
     via FE80::200:5EFF:FE04:3302, cost  2, tag 0, A, 6 Sec
 Dest 4000:1::/64,
     via FE80::200:5EFF:FE04:3302, cost  2, tag 0, A, 6 Sec
 Dest 4000:2::/64,
     via FE80::200:5EFF:FE04:3302, cost  2, tag 0, A, 6 Sec
 Dest 4000:3::/64,
     via FE80::200:5EFF:FE04:3302, cost  2, tag 0, A, 6 Sec
 Dest 4000:4::/64,
```

Table 319 Description on the fields of the display ripng route command

Field	Description
Peer	Neighbor connected to the interface
Dest	IPv6 destination address
via	Next hop IPv6 address
cost	Routing metric value
tag	Route tag
Sec	Time that a route entry stays in a particular state
A"	The route is in the aging state
S"	The route is in the suppressed state
G"	The route is in the Garbage-collect state

filter-policy export

Syntax **filter-policy** { *acl6-number* | **ipv6-prefix** *ipv6-prefix-name* } **export** [*protocol* [*process-id*]]

undo filter-policy export [*protocol* [*process-id*]]

View RIPng view

Parameters *acl6-number*: Specifies the number of an ACL to filter advertised routing information, in the range of 2000 to 3999.

ipv6-prefix *ipv6-prefix-name*: Specifies the name of an IPv6 prefix list used to filter routing information, a string of 1 to 19 characters.

protocol: Routing protocol from which to filter routes redistributed, currently including **bgp4+**, **direct**, **isisv6**, **ospfv3**, **ripng**, and **static**

process-id: Process number of the specified routing protocol, in the range of 1 to 65535. This argument is specified only when the routing protocol is **rip**, **ospf**, or **isis**.

Description Use the **filter-policy export** command to define an outbound route filtering policy. Only routes passing the filter can be advertised in the update messages.

Use the **undo filter-policy export** command to restore the default.

By default, RIPng does not filter any outbound routing information.

With the *protocol* argument specified, only routing information redistributed from the specified routing protocol will be filtered. Otherwise, all routing information will be filtered.

Examples # Use IPv6 prefix list Filter 2 to filter advertised RIPng updates.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100] filter-policy ipv6-prefix Filter2 export
```

filter-policy import (RIPng view)

Syntax **filter-policy** { *acl6-number* | **ipv6-prefix** *ipv6-prefix-name* } **import**

undo filter-policy import

View RIPng view

Parameters *acl6-number*: Specifies the number of an ACL to filter received routing information, in the range of 2000 to 3999.

ipv6-prefix *ipv6-prefix-name*: Specifies the name of an IPv6 Prefix list to filter incoming routes, in the range 1 to 19 characters.

Description Use the **filter-policy import** command to filter incoming routing information. Only routes which match the filtering policy can be received.

Use the **undo filter-policy import** command to disable incoming route filtering.

By default, RIPng does not filter incoming routing information.

Examples # Reference IPv6 prefix list **Filter1** to filter received RIPng updates.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100] filter-policy ipv6-prefix Filter1 import
```

import-route

Syntax **import-route** *protocol* [*process-id*] [**allow-ibgp**] [**cost** *cost* | **route-policy** *route-policy-name*] *

undo import-route *protocol* [*process-id*]

View RIPng view

Parameters *protocol*: Specifies a routing protocol from which to redistribute routes. Currently, it can be **bgp4+**, **direct**, **isisv6**, **ospfv3**, **ripng**, or **static**.

process-id: Process ID, in the range of 1 to 65535. The default is 1. This argument is available only when the protocol is **isisv6**, **ospfv3**, or **ripng**.

cost: Routing metric of redistributed routes, in the range of 0 to 16. If *cost value* is not specified, the metric is the default metric specified by the **default cost** command.

route-policy *route-policy-name*: Specifies a routing policy by its name with 1 to 19 characters.

allow-ibgp: Optional keyword when the specified *protocol* is **bgp4+**. The **import-route bgp4+** command redistributes only EBGP routes. The **import-route bgp4+ allow-ibgp** command redistributes additionally IBGP routes, thus be cautious when using it.

Description Use the **import-route** command to redistribute routes from another routing protocol.

Use the **undo import-route** command to disable redistributing routes from another routing protocol.

By default, RIPng does not redistribute routes from other routing protocols.

- You can configure a routing policy to redistribute only needed routes.
- You can specify a cost for redistributed routes using keyword **cost**.

Related commands: **default cost** on page 1280.

Examples # Redistribute IPv6-IS-IS routes (process 7) and specify the metric as 7.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100] import-route isisv6 7 cost 7
```

maximum load-balancing (RIPng view)

Syntax **maximum load-balancing** *number*

undo maximum load-balancing

View RIPng view

Parameters *number*: Maximum number of equal-cost load-balanced routes, in the range 1 to 8.

Description Use the **maximum load-balancing** command to specify the maximum number of equal cost routes for load balancing.

Use the **undo maximum load-balancing** command to restore the default.

You need configure the maximum number according to the memory size.

Examples # Set the maximum number of equal cost load balanced routes to 2.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100] maximum load-balancing 2
```

Restore the default.

```
[Sysname-ripng-100] undo maximum load-balancing
```

preference

Syntax **preference** [**route-policy** *route-policy-name*] *preference*

undo preference [**route-policy**]

View RIPng view

Parameters *route-policy-name*: Name of a routing policy, in the range of 1 to 19 characters.

preference: RIPng route priority, in the range of 1 to 255.

Description

Use the **preference** command to specify the RIPng route priority.

Use the **undo preference route-policy** command to restore the default.

By default, the priority of a RIPng route is 100.

Using the **route-policy** keyword can set a priority for routes filtered in by the routing policy:

- If a priority is set in the routing policy, the priority applies to matched routes, and the priority set by the **preference** command applies to routes not matched.
- If no priority is set in the routing policy, the one set by the **preference** command applies to all routes.

Examples

Set the RIPng route priority to 120.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100] preference 120
```

Restore the default RIPng route priority.

```
[Sysname-ripng-100] undo preference
```

ripng

Syntax

ripng [*process-id*]

undo ripng [*process-id*]

View

System view

Parameters

process-id: RIPng process number, in the range of 1 to 65535. The default value is 1.

Description

Use the **ripng** command to create a RIPng process and enter RIPng view.

Use the **undo ripng** command to disable a RIPng process.

By default, no RIPng process is enabled.

Examples

Create RIPng process 100 and enter its view.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100]
```

Disable RIPng process 100.

```
[Sysname] undo ripng 100
```

ripng default-route

Syntax **ripng default-route** { **only** | **originate** } [**cost** *cost*]

undo ripng default-route

View Interface view

Parameters **only**: Indicates that only the IPv6 default route (::/0) is advertised via the interface.

originate: Indicates that the IPv6 default route (::/0) is advertised without suppressing other routes.

cost: Metric of the advertised default route, in the range of 1 to 15, with a default value of 1.

Description Use the **ripng default-route** command to advertise a default route with the specified routing metric to a RIPng neighbor.

Use the **undo ripng default-route** command to stop advertising and forwarding the default route.

By default, a RIP process does not advertise any default route.

After you execute this command, the generated RIPng default route is advertised in a route update over the specified interface. This IPv6 default route is advertised without considering whether it already exists in local IPv6 routing table.

Examples # Advertise only the default route via Ethernet 1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ripng default-route only
```

Advertise the default route together with other routes via Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ripng default-route originate
```

ripng enable

Syntax **ripng** *process-id* **enable**

undo ripng enable

View Interface view

Parameters *process-id*: RIPng process number, in the range of 1 to 65535.

Description Use the **ripng enable** command to enable RIPng on the specified interface.

Use the **undo ripng enable** command to disable RIPng on the specified interface.

By default, RIPng is disabled on an interface.

Examples # Enable RIPng100 on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ripng 100 enable
```

ripng metricin

Syntax **ripng metricin** *value*

undo ripng metricin

View Interface view

Parameters *value*: Additional metric to received routes, in the range of 0 to 16.

Description Use the **ripng metricin** command to specify an additional metric for received RIPng routes.

Use the **undo ripng metricin** command to restore the default.

By default, the additional metric to received routes is 0.

Related commands: **ripng metricout**.

Examples # Specify the additional routing metric as 12 for RIPng routes received by Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ripng metricin 12
```

ripng metricout

Syntax **ripng metricout** *value*

undo ripng metricout

View Interface view

Parameters *value*: Additional metric to advertised routes, in the range of 1 to 16.

Description Use the **ripng metricout** command to configure an additional metric for RIPng routes advertised by an interface.

Use the **undo rip metricout** command to restore the default.

The default additional routing metric is 1.

Related commands: **ripng metricin**.

Examples # Set the additional metric to 12 for routes advertised by Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ripng metricout 12
```

ripng poison-reverse

Syntax **ripng poison-reverse**

undo ripng poison-reverse

View Interface view

Parameters None

Description Use the **rip poison-reverse** command to enable the poison reverse function.

Use the **undo rip poison-reverse** command to disable the poison reverse function.

By default, the poison reverse function is disabled.

Examples # Enable the poison reverse function for RIPng update messages on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ripng poison-reverse
```

ripng split-horizon

Syntax **ripng split-horizon**

undo ripng split-horizon

View Interface view

Parameters None

Description Use the **rip split-horizon** command to enable the split horizon function.

Use the **undo rip split-horizon** command to disable the split horizon function.

By default, the split horizon function is enabled.

Note that:

- The split horizon function is necessary for preventing routing loops. Therefore, you are not recommended to disable it.
- In special cases, make sure that it is necessary to disable the split horizon function before doing so.

- *If both the poison reverse and split horizon functions are enabled, only the poison reverse function takes effect.*
- *On Frame Relay, X.25 and other non-broadcast multi-access (NBMA) links, split horizon should be disabled if multiple VCs are configured on the primary interface and secondary interfaces to ensure route advertisement. For detailed information, refer to "Frame Relay Configuration Commands" on page 371 and "LAPB and X.25 Configuration Commands" on page 421.*

Examples # Enable the split horizon function on Ethernet1/0.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ripng split-horizon
```

ripng summary-address

Syntax **ripng summary-address** *ipv6-address prefix-length*

undo ripng summary-address *ipv6-address prefix-length*

View Interface view

Parameters *ipv6-address*: Destination IPv6 address of the summary route.

prefix-length: Prefix length of the destination IPv6 address of the summary route, in the range of 0 to 128. It indicates the number of consecutive 1s of the prefix, which defines the network ID.

Description Use the **ripng summary-address** command to configure a summary advertised through the interface.

Use the **undo ripng summary-address** command to remove the summary.

If the prefix and the prefix length of a route match the IPv6 prefix, the IPv6 prefix will be advertised instead. Thus, one route can be advertised on behalf of many routes. After summarization, the summary route cost is the lowest cost among summarized routes.

Examples # Assign an IPv6 address with the 64-bit prefix to Ethernet1/0 and configure a summary with the 35-bit prefix.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] ipv6 address 2001:200::3EFF:FE11:6770/64
[Sysname-Ethernet1/0] ripng summary-address 2001:200:: 35
```

timers

Syntax **timers** { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* }*

undo timers { **garbage-collect** | **suppress** | **timeout** | **update** }*

View RIPng view

Parameters *garbage-collect-value*: Interval of the garbage-collect timer in seconds, in the range of 1 to 86400.

suppress-value: Interval of the suppress timer in seconds, in the range of 0 to 86400.

timeout-value: Interval of the timeout timer in seconds, in the range of 1 to 86400.

update-value: Interval of the update timer in seconds, in the range of 1 to 86400.

Description Use the **timers** command to configure RIPng timers.

Use the **undo timers** command to restore the default.

By default, the garbage-collect timer is 120 seconds, the suppress timer 120 seconds, the timeout timer 180 seconds, and the update timer 30 seconds.

RIPng is controlled by the above four timers.

- The update timer defines the interval between update messages.
- The timeout timer defines the route aging time. If no update message related to a route is received within the aging time, the metric of the route is set to 16 in the routing table.
- The suppress timer defines how long a RIPng route stays in the suppressed state. When the metric of a route is 16, the route enters the suppressed state. In the suppressed state, only routes which come from the same neighbor and whose metric is less than 16 will be received by the router to replace unreachable routes.
- The garbage-collect timer defines the interval from when the metric of a route becomes 16 to when it is deleted from the routing table. During the garbage-collect timer length, RIPng advertises the route with the routing metric set to 16. If no update message is announced for that route before the

garbage-collect timer expires, the route will completely be deleted from the routing table.

Note that:

- You are not recommended to change the default values of these timers under normal circumstances.
- The lengths of these timers must be kept consistent on all routers and access servers in the network

Examples # Configure the update, timeout, suppress, and garbage-collect timers as 5s, 15s, 15s and 30s.

```
<Sysname> system-view
[Sysname] ripng 100
[Sysname-ripng-100] timers update 5
[Sysname-ripng-100] timers timeout 15
[Sysname-ripng-100] timers suppress 15
[Sysname-ripng-100] timers garbage-collect 30
```

86 IPv6 Static Routing Configuration Commands

delete ipv6 static-routes all

Syntax **delete ipv6 static-routes all**

View System view

Parameters None

Description Use the **delete ipv6 static-routes all** command to delete all static routes including the default route.

When using this command, you will be prompted whether to continue the deletion and only after you confirm the deletion will the static routes be deleted.

Related commands: **display ipv6 routing-table** on page 942 and **ipv6 route-static**.

Examples # Delete all IPv6 static routes.

```
<Sysname> system-view
[Sysname] delete ipv6 static-routes all
This will erase all ipv6 static routes and their configurations, you
 must reconfigure all static routes
Are you sure?[Y/N]Y
```

ipv6 route-static

Syntax For a broadcast interface (Ethernet interface, VLAN interface), or NBMA interface (X25 or frame relay interface):

ipv6 route-static *ipv6-address prefix-length* [*interface-type interface-number*] *nexthop-address* [**preference** *preference-value*]

undo ipv6 route-static *ipv6-address prefix-length* [*interface-type interface-number*] [*nexthop-address*] [**preference** *preference-value*]

For a point-to-point interface (serial port):

ipv6 route-static *ipv6-address prefix-length* { *interface-type interface-number* | *nexthop-address* } [**preference** *preference-value*]

undo ipv6 route-static *ipv6-address prefix-length* [*interface-type interface-number* | *nexthop-address*] [**preference** *preference-value*]

View System view

Parameters *ipv6-address prefix-length*: IPv6 address and prefix length.

interface-type interface-number: Interface type and interface number of the output interface.

nexthop-address: Next hop IPv6 address.

preference-value: Route preference value, in the range of 1 to 255. The default is 60.

Description Use the **ipv6 route-static** command to configure an IPv6 static route.

Use the **undo ipv6 route-static** command to remove an IPv6 static route.

An IPv6 static route that has the destination address configured as "::/0" (a prefix length of 0) is the default IPv6 route. If the destination address of an IPv6 packet does not match any entry in the routing table, this default route will be used to forward the packet.

While configuring static routes, you can configure either the output interface or the next-hop address depending on the situations:

- If the output interface is a broadcast interface, such as an Ethernet interface, a VLAN interface, or an NBMA interface (such as an interface with X25 or frame relay encapsulated), then the next hop address must be specified;
- If the output interface is a point-to-point interface, such as a serial port, you can specify either the output interface or the next hop address, but not both.

Related commands: **display ipv6 routing-table** on page 942 and **delete ipv6 static-routes all**.

Examples # Configure a static IPv6 route, with the destination address being 1:1:2::/24 and next hop being 1:1:3::1.

```
<Sysname> system-view
[Sysname] ipv6 route-static 1:1:2:: 24 1:1:3::1
```

87 MULTICAST ROUTING AND FORWARDING CONFIGURATION COMMANDS

display multicast boundary

Syntax **display multicast** [**vpn-instance** *vpn-instance-name* | **all-instance**] **boundary** [*group-address* [*mask* | *mask-length*]] [**interface** *interface-type interface-number*]

View Any view

Parameter *vpn-instance-name*: VPN instance name, a case sensitive string of up to 31 characters.

all-instance: Specifies all VPN instances.

group-address: Multicast group address, in the range of 224.0.1.0 to 239.255.255.255.

mask: Mask of the multicast group address, 255.255.255.255 by default.

mask-length: Mask length of the multicast group address, in the range of 4 to 32. The system default is 32.

interface-type interface-number: Specifies an interface by its type and number.

Description Use the **display multicast boundary** command to view the multicast boundary information on the specified interface or all interfaces.

Related command: **multicast boundary**.

Example # View the multicast boundary information on all interfaces in the public instance.

```
<Sysname> display multicast boundary
Multicast boundary information of VPN-Instance: public net
 Boundary            Interface
 224.1.1.0/24        Eth1/0
 239.2.2.0/24        Pos5/0
```

Table 320 Description on the fields of the display multicast boundary command

Field	Description
Boundary	Multicast group corresponding to the multicast boundary
Interface:	Boundary interface corresponding to the multicast boundary

display multicast forwarding-table

Syntax **display multicast** [**vpn-instance** *vpn-instance-name* | **all-instance**] **forwarding-table** [*source-address* [**mask** { *mask* | *mask-length* }] | *group-address* [**mask** { *mask* | *mask-length* }] | **incoming-interface** { *interface-type interface-number* | **register** } | **outgoing-interface** { { **exclude** | **include** | **match** } { *interface-type interface-number* | **register** } } | **statistics**] * [**port-info**]

View Any view

Parameter *vpn-instance-name*: VPN instance name, a case sensitive string of up to 31 characters.

all-instance: Specifies all VPN instances.

source-address: Multicast source address.

group-address: Multicast group address, in the range of 224.0.1.0 to 239.255.255.255.

mask: Mask of the multicast group/source address, 255.255.255.255 by default.

mask-length: Mask length of the multicast group/source address. For a multicast group address, this argument has an effective value range of 4 to 32; for a multicast source address, this argument has an effective value range of 0 to 32. The system default is 32 in both cases.

incoming-interface: Displays forwarding entries of which the incoming interface is the specified one.

register: Specifies the register interface.

outgoing-interface: Displays forwarding entries of which the outgoing interface is the specified one.

exclude: Displays the routing entries of which the outgoing interface list (OIL) excludes the specified interface.

include: Displays the routing entries of which the OIL includes the specified interface.

match: Specifies the routing entries of which the OIL includes and includes only the specified interface.

statistics: Specifies to display the statistics information of the multicast forwarding table.

port-info: Specifies to display Layer 2 port information.

Description Use the **display multicast forwarding-table** command to view the multicast forwarding table information.

Related command: **multicast forwarding-table downstream-limit**, **multicast forwarding-table route-limit** and **display multicast routing-table**.

Example # View the multicast forwarding table information in the public network instance.

```
<Sysname> display multicast forwarding-table
Multicast Forwarding Table of VPN-Instance: public net
Total 1 entry

Total 1 entry matched

00001. (172.168.0.2, 227.0.0.1)
     MID: 0, Flags: 0x0:0
     Uptime: 00:08:32, Timeout in: 00:03:26
     Incoming interface: Ethernet1/0
     List of 1 outgoing interfaces:
       1: Ethernet1/1
     Matched 19648 packets(20512512 bytes), Wrong If 0 packets
     Forwarded 19648 packets(20512512 bytes)
```

Table 321 Description on the fields of display multicast forwarding-table

Field	Description
00001	Sequence number of the (S, G) entry
(172.168.0.2,227.0.0.1)	An (S, G) entry of the multicast forwarding table
MID	(S, G) entry ID. Each (S, G) entry has a unique MID
Flags	Current state of the (S, G) entry. Different bits are used to indicate different states of (S, G) entries. Major values of this field are described in Table 322.
Uptime	Length of time for which the (S, G) entry has been up, in hours:minutes:seconds
Timeout in	Length of time in which the (S, G) entry will expire, in hours:minutes:seconds
Incoming interface	Incoming interface of the (S, G) entry
List of outgoing interface:	1 outgoing interface list:
1: Ethernet1/1	Sequence number of outgoing interface: outgoing interface type and number
Matched 19648 packets (20512512 bytes), Wrong If 0 packets	Number of matched packets (number of bytes), number of packets with incoming interface errors
Forwarded 19648 packets (20512512 bytes)	Number of forwarded packets (number of bytes)

Table 322 Major values of the flags field

Value	Meaning
0x00000001	Indicates that a register-stop message must be sent
0x00000002	Indicates whether the multicast source corresponding to the (S, G) is active
0x00000004	Indicates a null forwarding entry
0x00000008	Indicates whether the RP is a PIM domain border router
0x00000010	Indicates that a register outgoing interface is available
0x00000400	Identifies an entry to be deleted

Table 322 Major values of the flags field

Value	Meaning
0x00008000	Indicates that the (S, G) entry is in the smoothening process after active/standby switchover
0x00010000	Indicates that the (S, G) has been updated during the smoothing process
0x00080000	Indicates that the (S, G) entry has been repeatedly updated and needs to be deleted before a new entry is added
0x00100000	Indicates that an entry is successfully added

display multicast minimum-ttl

Syntax **display multicast** [**vpn-instance** *vpn-instance-name* | **all-instance**] **minimum-ttl** [*interface-type interface-number*]

View Any view

Parameter *vpn-instance-name*: VPN instance name, a case sensitive string of up to 31 characters.

all-instance: Specifies all VPN instances.

interface-type interface-number: Specifies an interface by its type and number. If you do not specify an interface, this command will display the minimum time-to-live (TTL) required for a multicast packet to be forwarded on all interfaces.

Description Use the **display multicast minimum-ttl** command to view the minimum TTL required for a multicast packet to be forwarded on the specified interface or all interfaces.

Related command: **multicast minimum-ttl**.

Example # View the minimum TTL required for a multicast packet to be forwarded on all interfaces of the public instance.

```
<Sysname> display multicast minimum-ttl
Multicast TTL information of VPN-Instance: public net
 Interface           TTL
 Eth1/0              5
 Eth1/1              6
```

Table 323 Description on the fields of the display multicast minimum-ttl command

Field	Description
Interface	Interface name
TTL	Minimum TTL required for a multicast packet to be forwarded on the interface

display multicast routing-table

Syntax **display multicast** [**vpn-instance** *vpn-instance-name* | **all-instance**] **routing-table** [*source-address* [**mask** { *mask* | *mask-length* }] | *group-address* [**mask** { *mask* | *mask-length* }] | **incoming-interface** { *interface-type interface-number* | **register** } | **outgoing-interface** { { **exclude** | **include** | **match** } { *interface-type interface-number* | **register** } }] *

View Any view

Parameter *vpn-instance-name*: VPN instance name, a case sensitive string of up to 31 characters.

all-instance: Specifies all VPN instances.

source-address: Multicast source address.

group-address: Multicast group address, in the range of 224.0.1.0 to 239.255.255.255.

mask: Mask of the multicast group/source address, 255.255.255.255 by default.

mask-length: Mask length of the multicast group/source address. For a multicast group address, this argument has an effective value range of 4 to 32; for a multicast source address, this argument has an effective value range of 0 to 32. The system default is 32 in both cases.

incoming-interface: Displays multicast routing entries of which the incoming interface is the specified one.

interface-type interface-number: Specifies an interface by its type and number.

register: Specifies the register interface of PIM-SM.

outgoing-interface: Displays multicast routing entries of which the outgoing interface is the specified one.

exclude: Displays routing entries of which the OIL excludes the specified interface.

include: Displays routing entries of which the OIL includes the specified interface.

match: Displays routing entries of which the OIL includes only the specified interface.

Description Use the **display multicast routing-table** command to view the multicast routing table information.

Related command: **display multicast forwarding-table**.

Example # View the routing information in the multicast routing table of the public instance.

```
<Sysname> display multicast routing-table
Multicast routing table of VPN-Instance: public net
 Total 1 entry
 00001. (172.168.0.2, 227.0.0.1)
       Uptime: 00:00:28
       Upstream Interface: Ethernet1/1
       List of 2 downstream interfaces
           1:  Ethernet1/2
           2:  Ethernet1/0
```

Table 324 Description on the fields of display multicast routing-table

Field	Description
00001	Sequence number of the (S, G) entry
(172.168.0.2, 227.0.0.1)	An (S, G) entry of the multicast forwarding table
Uptime	Length of time for which the (S, G) entry has been up, in hours:minutes:seconds
Upstream interface	Upstream interface the (S, G) entry: multicast packets should arrive at this interface
List of 2 downstream interfaces	Downstream interface list: these interfaces need to forward multicast packets

display multicast routing-table static

Syntax **display multicast routing-table** [**vpn-instance** *vpn-instance-name* | **all-instance**] **static** [**config**] [*source-address* { *mask-length* | *mask* }]

View Any view

Parameter *vpn-instance-name*: VPN instance name, a case sensitive string of up to 31 characters.

all-instance: Specifies all VPN instances.

config: Displays the configuration information of static routes.

source-address: Multicast source address.

mask: Mask of the multicast source address.

mask-length: Mask length of the multicast source address, in the range of 0 to 32.

Description Use the **display multicast routing-table static** command to view the information of multicast static routes.

Example # View all the multicast static routes in the public instance.

```
<Sysname> display multicast routing-table static
Multicast Routing Table of VPN-Instance: public net
Routes : 1

 Mroute 10.10.0.0/16
          Interafce = Ethernet1/0         RPF Neighbor = 10.10.0.254
          Matched routing protocol = <none>, Route-policy = <none>
```

```
          Preference = 1, Order = 1
 Running Configuration = ip rpf-route-static 10.10.0.0 16 2.2.2.2 order 1
```

View the configuration information of multicast static routes in the public instance.

```
<Sysname> display multicast routing-table static config

Multicast Routing Table of VPN-Instance: public net
Routes : 1

 Mroute 10.10.0.0/16,      interface = Ethernet1/0
 Matched routing protocol = <none>, Route-policy = <none>
 Preference = 1, Order = 1
```

Table 325 Description on the fields of display multicast routing-table static

Field	Description
Mroute	Multicast route source address and its mask length
Interface	Outgoing interface to the multicast source
RPF Neighbor	IP address of an RPF neighbor through which the multicast source is reachable
Matched routing protocol	If a protocol is configured, the multicast source address of the route should be the destination address of an entry in unicast routing table
Route-policy	Routing policy. The multicast source address of the route should match the routing policy
Preference	Route preference
Order	Sequence number of the route

display multicast rpf-info

Syntax **display multicast** [**vpn-instance** *vpn-instance-name* | **all-instance**] **rpf-info** *source-address* [*group-address*]

View Any view

Parameter *vpn-instance-name*: VPN instance name, a case sensitive string of up to 31 characters.

all-instance: Specifies all VPN instances.

source-address: Multicast source address.

group-address: Multicast group address, in the range of 224.0.1.0 to 239.255.255.255.

Description Use the **display multicast rpf-info** command to view the RPF information of a multicast source.

Related command: **display multicast routing-table** and **display multicast forwarding-table**.

Example # View all the RPF information of multicast source 192.168.1.55 in the public network.

```
<Sysname> display multicast rpf-info 192.168.1.55
RPF information about source 192.168.1.55:
     RPF interface: Ethernet1/0, RPF neighbor: 10.1.1.1
     Referenced route/mask: 192.168.1.0/24
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
```

Table 326 Description on the fields of the display multicast rpf-info command

Field	Description
RPF information about source 192.168.1.55	Information of the RPF path to multicast source 192.168.1.55
RPF interface	RPF interface
RPF neighbor	IP address of the RPF neighbor
Referenced route/mask	Referenced route and its mask length
Referenced route type	Type of the referenced route, which can be any of the following: ■ igp: unicast route (IGP) ■ egp: unicast route (BGP) ■ unicast (direct): unicast route (directly connected) ■ unicast: other unicast route (such as unicast static route) ■ multicast static: multicast static route
Route selection rule	Rule for RPF route selection, which can be based on the preference of the routing protocol or based on the longest match on the destination address
Load splitting rule	Status of the load splitting rule (enabled/disabled)

ip rpf-route-static

Syntax **ip rpf-route-static** [**vpn-instance** *vpn-instance-name*] *source-address* { *mask* | *mask-length* } [*protocol* [*process-id*]] [**route-policy** *policy-name*] { *rpf-nbr-address* | *interface-type interface-number* } [**preference** *preference*] [**order** *order-number*]

undo ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask* | *mask-length* } [*protocol* [*process-id*]] [**route-policy** *policy-name*]

View System view

Parameter *vpn-instance-name*: VPN instance name, a case sensitive string of up to 31 characters.

source-address: Multicast source address.

mask: Mask of the multicast source address.

mask-length: Mask length of the multicast source address, in the range of 0 to 32.

protocol: Routing protocol, which can have any of the following values:

- **bgp**: Specifies the BGP protocol
- **isis**: Specifies the IS-IS protocol
- **ospf**: Specifies the OSPF protocol
- **rip**: Specifies the RIP protocol

process-id: Process number of the unicast routing protocol, in the range of 1 to 65535. This argument must be provided if IS-IS, OSPF or RIP is the specified unicast routing protocol.

policy-name: Name of the multicast route match rule, a case sensitive string of up to 19 characters.

rpf-nbr-address: IP address of the PPF neighbor.

interface-type interface-number: Specifies the interface type and number of an RPF neighbor. The interface type must not be Ethernet, GigabitEthernet, Loopback or Vlan-interface.

preference: Route preference, in the range of 1 to 255 and defaulting to 1.

order-number: Match order for routes on the same segment, in the range of 1 to 100.

Description Use the **ip rpf-route-static** command to configure a multicast static route.

Use the **undo ip rpf-route-static** command to delete a multicast static route from the multicast static routing table.

By default, no multicast static route is configured.

Note that:

- The arguments *source-address* { *mask* | *mask-length* }, *protocol* and *policy-name* are critical elements in multicast static route configuration. The variation of any of these three arguments results in a different configuration.
- In the configuration, you can use the **display multicast routing-table static** command to check whether the multicast static route information contains this configuration. If you find a match, modify the corresponding fields without changing the configuration sequence; otherwise, add a multicast static route.
- When configuring a multicast static route, you cannot designate an RPF neighbor by specifying an interface (by means of the *interface-type interface-number* command argument combination) if the interface type of that router is Ethernet, GigabitEthernet, Loopback or Vlan-interface; instead, you can designate an RPF neighbor only by specifying an address (*rpf-nbr-address*).
- Because outgoing interface iteration may fail or the specified interface may be in the down state, the multicast static route configured with this command may fail to take effect. Therefore, we recommend that you use the **display multicast routing-table static** command after you configure a multicast

static route to check whether the route has been successfully configured or whether the route has taken effect.

Related command: **display multicast routing-table static**.

Example # Configure a multicast static route to the multicast source 10.1.1.1/24, specifying a router with the IP address of 192.168.1.23 as its RPF neighbor.

```
<Sysname> system-view
[Sysname] ip rpf-route-static 10.1.1.1 24 192.168.1.23
```

mtracert

Syntax **mtracert** *source-address* [[*last-hop-router-address*] *group-address*]

View Any view

Parameters *source-address*: Specifies a multicast source address.

group-address: Specifies a multicast group address, in the range of 224.0.1.0 to 239.255.255.255.

last-hop-router-address: Specifies a last-hop router address, which is the IP address of the local router by default.

Description Use the **mtracert** command to trace the path down which the multicast traffic from a given multicast source flows to the last-hop router.

Note that if the *last-hop-router-address* argument is given in the command to trace the path for a specific (S, G) multicast stream, the interface corresponding to the last-hop router address must be the outgoing interface for the (S, G) multicast stream; otherwise the multicast traceroute will fail.

Examples # Trace the path down which the (6.6.6.6, 225.2.1.1) multicast traffic flows from the multicast source to the last-hop router with the (S, G) outgoing interface address of 5.5.5.8.

```
<Sysname> mtracert 6.6.6.6 5.5.5.8 225.2.1.1
Type Ctrl+C to quit mtrace facility
Tracing reverse path of (6.6.6.6, 225.2.1.1) from last-hop router (5
.5.5.8) to source via multicast routing-table

 -1 5.5.5.8
   Incoming interface address: 4.4.4.8
   Previous-hop router address: 4.4.4.7
   Input packet count on incoming interface: 17837
   Output packet count on outgoing interface: 0
   Total number of packets for this source-group pair: 8000
   Protocol: PIM
   Forwarding TTL: 0
   Forwarding code: No error
```

```
-2 4.4.4.7
  Incoming interface address: 6.6.6.7
  Previous-hop router address: 0.0.0.0
  Input packet count on incoming interface: 2
  Output packet count on outgoing interface: 259
  Total number of packets for this source-group pair: 8100
  Protocol: PIM
  Forwarding TTL: 0
  Forwarding code: No error
```

Table 327 Description on the fields of the mtracert command

Field	Description
last-hop router	Last-hop router
(6.6.6.6, 225.2.1.1)	The (S, G) multicast stream for which the forwarding path is being traced
-1 5.5.5.8	The (S, G) outgoing interface address of each hop, starting from the last-hop router
Incoming interface address	The address of the interface on which the (S, G) packets arrive
Previous-hop router address	The IP address of the router from which this router receives packets from this source
Input packet count on incoming interface	The total number of multicast packets received on the incoming interface
Output packet count on outgoing interface	The total number of multicast packets transmitted for transmission on the outgoing interface
Total number of packets for this source-group pair	The total number of packets from the specified source forwarded by this router to the specified group
Protocol	The multicast routing protocol in use between this router and the previous hop router
Forwarding TTL	The minimum TTL that a packet is required to have before it can be forwarded over the outgoing interface
Forwarding code	Forwarding code

multicast boundary

Syntax **multicast boundary** *group-address* { *mask* | *mask-length* }

undo multicast boundary { *group-address* { *mask* | *mask-length* } | **all** }

View Interface view

Parameter *group-address*: Multicast group address, in the range of 224.0.0.0 to 239.255.255.255.

mask: Mask of the multicast group address.

mask-length: Mask length of the multicast group address, in the range of 4 to 32.

all: Specifies to remove all forwarding boundaries configured on the interface.

Description Use the **multicast boundary** command to configure a multicast forwarding boundary.

Use the **undo multicast boundary** command to remove a multicast forwarding boundary.

By default, no multicast forwarding boundary is configured.

Note that:

- A multicast forwarding boundary sets the boundary condition for the multicast groups in the specified range. If the destination address of a multicast packet matches the set boundary condition, the packet will not be forwarded.
- If an interface needs to act as a forwarding boundary for multiple multicast groups, just carry out this command on the interface once for each group.
- Assume that Set A and Set B are both multicast forwarding boundary sets to be configured, and B is a subset of A. If A has been configured on an interface, it is not allowed to configure B on the interface; if B has been configured on the interface before A is configured, the previously configured B will be removed.

Related command: **display multicast boundary**.

Example # Configure Ethernet 1/0 to be the forwarding boundary of multicast group 239.2.0.0/16.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] multicast boundary 239.2.0.0 16
```

multicast forwarding-table downstream-limit

Syntax **multicast forwarding-table downstream-limit** *limit*

undo multicast forwarding-table downstream-limit

View System view, VPN instance view

Parameter *limit*: Maximum number of downstream nodes (namely, the maximum number of outgoing interfaces) for a single route in the multicast forwarding table. The value ranges from 0 to 128.

Description Use the **multicast forwarding-table downstream-limit** command to configure the maximum number of downstream nodes for a single route in the multicast forwarding table.

Use the **undo multicast forwarding-table downstream-limit** command to restore the system default.

By default, the maximum number of downstream nodes for a single route in the multicast forwarding table is 128.

The system-allowed maximum number varies with different device models. Refer to your specific device model.

Related command: **display multicast forwarding-table**.

Example # Set the maximum number of downstream nodes for a single route in the multicast forwarding table of the public instance to 120.

```
<Sysname> system-view
[Sysname] multicast forwarding-table downstream-limit 120
```

Set the maximum number of downstream nodes for a single route in the multicast forwarding table of VPN instance mvpn to 60.

```
<Sysname> system-view
[Sysname] ip vpn-instance mvpn
[Sysname-vpn-instance-mvpn] multicast forwarding-table downstream-limit 60
```

multicast forwarding-table route-limit

Syntax **multicast forwarding-table route-limit** *limit*

undo multicast forwarding-table route-limit

View System view, VPN instance view

Parameter *limit*: Maximum number of route entries in the multicast forwarding table. The value ranges from 0 to 900.

Description Use the **multicast forwarding-table route-limit** command to configure the maximum number of route entries in the multicast forwarding table.

Use the **undo multicast forwarding-table route-limit** command to restore the system default.

By default, the maximum number of route entries in the multicast forwarding table is 900.

The system-allowed maximum number varies with different device models. Refer to your specific device model.

Related command: **display multicast forwarding-table**.

Example # Set the maximum number of routing entries in the multicast forwarding table of the public instance to 200.

```
<Sysname> system-view
[Sysname] multicast forwarding-table route-limit 200
```

Set the maximum number of routing entries in the multicast forwarding table of VPN instance mvpn to 200.

```
<Sysname> system-view
[Sysname] ip vpn-instance mvpn
[Sysname-vpn-instance-mvpn] multicast forwarding-table route-limit 200
```

multicast load-splitting

Syntax **multicast load-splitting** { **source** | **source-group** }

undo multicast load-splitting

View System view, VPN instance view

Parameter **source**: Specifies to implement per-source load splitting.

source-group: Specifies to implement per-source and per-group load splitting simultaneously.

Description Use the **multicast load-splitting** command to enable load splitting of multicast traffic.

Use the **undo multicast load-splitting** command to disable load splitting of multicast traffic.

By default, load splitting of multicast traffic is disabled.

Example # Enable per-source load splitting of multicast traffic in the public instance.

```
<Sysname> system-view
[Sysname] multicast load-splitting source
```

Enable per-source load splitting of multicast traffic in VPN instance mvpn.

```
<Sysname> system-view
[Sysname] ip vpn-instance mvpn
[Sysname-vpn-instance-mvpn] multicast load-splitting source
```

multicast longest-match

Syntax **multicast longest-match**

undo multicast longest-match

View System view, VPN instance view

Parameter None

Description Use the **multicast longest-match** command to configure route selection based on the longest match, namely based on the mask length.

Use the **undo multicast longest-match** command to remove the configuration of route selection based on the longest match.

By default, routes are selected according to the order of route entries.

Example # Configure route selection based on the longest match in the public instance.

```
<Sysname> system-view
[Sysname] multicast longest-match
```

Configure route selection based on the longest match in VPN instance mvpn.

```
<Sysname> system-view
[Sysname] ip vpn-instance mvpn
[Sysname-vpn-instance-mvpn] multicast longest-match
```

multicast minimum-ttl

Syntax **multicast minimum-ttl** *ttl-value*

undo multicast minimum-ttl

View Interface view

Parameter *ttl-value*: Minimum TTL required for a multicast packet to be forwarded on the interface, in the range of 1 to 255.

Description Use the **multicast minimum-ttl** command to configure the minimum TTL required for a multicast packet to be forwarded on the interface.

Use the **undo multicast minimum-ttl** command to restore the system default.

By default, the minimum TTL value required for a multicast packet to be forwarded is 1.

Related command: **display multicast minimum-ttl**.

Example # Set the minimum TTL required for a multicast packet to be forwarded on Ethernet 1/0 to 8.

```
<Sysname> system-view
[Sysname] interface ethernet 1/0
[Sysname-Ethernet1/0] multicast minimum-ttl 8
```

multicast routing-enable

Syntax **multicast routing-enable**

undo multicast routing-enable

View System view, VPN instance view

Parameter None

Description Use the **multicast routing-enable** command to enable IP multicast routing.

Use the **undo multicast routing-enable** command to disable IP multicast routing.

IP multicast routing is disabled by default.

Note that:

- You must enable IP multicast routing in the public instance or VPN instance before you can carry out other Layer 3 multicast commands in the corresponding instance.
- The device does not forward any multicast packets before IP multicast routing is enabled.

Example # Enable IP multicast routing in the public instance.

```
<Sysname> system-view
[Sysname] multicast routing-enable
```

Enable IP multicast routing in VPN instance mvpn.

```
<Sysname> system-view
[Sysname] ip vpn-instance mvpn
[Sysname-vpn-instance-mvpn] route-distinguisher 100:1
[Sysname-vpn-instance-mvpn] multicast routing-enable
```

reset multicast forwarding-table

Syntax **reset multicast** [**vpn-instance** *vpn-instance-name* | **all-instance**] **forwarding-table** { { *source-address* [**mask** { *mask* | *mask-length* }] | *group-address* [**mask** { *mask* | *mask-length* }] | **incoming-interface** { *interface-type interface-number* | **register** } } * | **all** }
